[113] With this I have said pretty well everything I can say about my therapeutic aims and intentions within the broad framework of a lecture. It can be no more than an incentive to thought, and I shall be quite content if such it has been.

V

PROBLEMS OF MODERN PSYCHOTHERAPY[1]

[114] Psychotherapy, or the treatment of the mind by psychological methods, is today identified in popular thought with "psychoanalysis."

[115] The word "psychoanalysis" has become so much a part of common speech that everyone who uses it seems to understand what it means. But what the word actually connotes is unknown to most laymen. According to the intention of its creator, Freud, it can be appropriately applied only to the method, inaugurated by himself, of reducing psychic symptoms and complexes to certain repressed impulses; and in so far as this procedure is not possible without the corresponding points of view, the idea of psychoanalysis also includes certain theoretical assumptions, formulated as the Freudian theory of sexuality expressly insisted upon by its author. But, Freud notwithstanding, the layman employs the term "psychoanalysis" loosely for all modern attempts whatsoever to probe the mind by scientific methods. Thus Adler's school must submit to being labelled "psychoanalytic" despite the fact that Adler's viewpoint and method are apparently in irreconcilable opposition to those of Freud. In consequence, Adler does not call his psychology "psychoanalysis" but "individual psychology"; while I prefer to call my own approach "analytical psychology." by which I mean something like a general concept embracing both psychoanalysis and individual psychology as well as other endeavours in the field of "complex psychology."

[116] Since, however, there is but one mind, or one psyche, in man, it might seem to the layman that there can be only one psychology, and he might therefore suppose these distinctions to be either subjective quibbles or the commonplace attempts of small-minded persons to set themselves up on little thrones. I could easily lengthen the list of "psychologies" by mentioning other systems not included under "analytical psychology."

There are in fact many different methods, standpoints, views, and beliefs which are all at war with one another, chiefly because they all misunderstand one another and refuse to give one another their due. The many-sidedness, the diversity, of psychological opinions in our day is nothing less than astonishing, not to say confusing for the layman.

[117] If, in a text-book of pathology, we find numerous remedies of the most diverse kind prescribed for a given disease, we may safely conclude that none of these remedies is particularly efficacious. So, when many different ways of approaching the psyche are recommended, we may rest assured that none of them leads with absolute certainty to the goal, least of all those advocated with fanaticism. The very number of present-day psychologies is a confession of perplexity. The difficulty of gaining access to the psyche is gradually being borne in upon us, and the psyche itself is seen to be a "horned problem," to use Nietzsche's expression. It is small wonder therefore that efforts to attack this elusive riddle keep on multiplying, first from one side and then from another. The variety of contradictory standpoints and opinions is the inevitable result.

[118] The reader will doubtless agree that in speaking of psychoanalysis we should not confine ourselves to its narrower connotation, but should deal in general with the successes and failures of the various contemporary endeavours, which we sum up under the term "analytical psychology," to solve the problem of the psyche.

[119] But why this sudden interest in the human psyche as a datum of experience? For thousands of years it was not so. I wish merely to raise this apparently irrelevant question, not to answer it. In reality it is not irrelevant, because the impulses at the back of our present-day interest in psychology have a sort of subterranean connection with this question.

[120] All that now passes under the layman's idea of "psychoanalysis" has its origin in medical practice; consequently most of it is medical psychology. This psychology bears the unmistakable stamp of the doctor's consulting-room, as can be seen not only in its terminology but also in its theoretical set-up. Everywhere we come across assumptions which the doctor has taken over from natural science and biology. It is this that has largely contributed to the divorce between modern

psychology and the academic or humane sciences, for psychology explains things in terms of irrational nature, whereas the latter studies are grounded in the intellect. The distance between mind and nature, difficult to bridge at best, is still further increased by a medical and biological nomenclature which often strikes us as thoroughly mechanical, and more often than not severely overtaxes the best-intentioned understanding.

[121] Having expressed the hope that the foregoing general remarks may not be out of place in view of the confusion of terms existing in this field, I should now like to turn to the real task in hand and scrutinize the achievements of analytical psychology.

[122] Since the endeavours of our psychology are so extraordinarily heterogeneous, it is only with the greatest difficulty that we can take up a broadly inclusive standpoint. If, therefore, I try to divide the aims and results of these endeavours into certain classes, or rather stages, I do so with the express reservation appropriate to a purely provisional undertaking which, it may be objected, is just as arbitrary as the surveyor's triangulation of a landscape. Be that as it may, I would venture to regard the sum total of our findings under the aspect of four stages, namely, confession, elucidation, education, and transformation. I shall now proceed to discuss these somewhat unusual terms.

[123] The first beginnings of all analytical treatment of the soul are to be found in its prototype, the confessional. Since, however, the two have no direct causal connection, but rather grow from a common irrational psychic root, it is difficult for an outsider to see at once the relation between the groundwork of psychoanalysis and the religious institution of the confessional.

[124] Once the human mind had succeeded in inventing the idea of sin, man had recourse to psychic concealment; or, in analytical parlance, repression arose. Anything concealed is a secret. The possession of secrets acts like a psychic poison that alienates their possessor from the community. In small doses, this poison may be an invaluable medicament, even an essential pre-condition of individual differentiation, so much so that even on the primitive level man feels an irresistible need actually to invent secrets: their possession safeguards him from

dissolving in the featureless flow of unconscious community life and thus from deadly peril to his soul. It is a well known fact that the widespread and very ancient rites of initiation with their mystery cults subserved this instinct for differentiation. Even the Christian sacraments were looked upon as “mysteries” in the early Church, and, as in the case of baptism, were celebrated in secluded spots and only mentioned under the veil of allegory.

[125] A secret shared with several persons is as beneficial as a merely private secret is destructive. The latter works like a burden of guilt, cutting off the unfortunate possessor from communion with his fellows. But, if we are conscious of what we are concealing, the harm done is decidedly less than if we do not know what we are repressing—or even that we have repressions at all. In this case the hidden content is no longer consciously kept secret; we are concealing it even from ourselves. It then splits off from the conscious mind as an independent complex and leads a sort of separate existence in the unconscious psyche, where it can be neither interfered with nor corrected by the conscious mind. The complex forms. so to speak, a miniature self-contained psyche which, as experience shows, develops a peculiar fantasy-life of its own. What we call fantasy is simply spontaneous psychic activity, and it wells up wherever the inhibitive action of the conscious mind abates or, as in sleep, ceases altogether. In sleep, fantasy takes the form of dreams. But in waking life, too, we continue to dream beneath the threshold of consciousness, especially when under the influence of repressed or other unconscious complexes. Incidentally, unconscious contents are on no account composed exclusively of complexes that were once conscious and subsequently became unconscious by being repressed. The unconscious, too, has its own specific contents which push up from unknown depths and gradually reach consciousness. Hence we should in no wise picture the unconscious psyche as a mere receptacle for contents discarded by the conscious mind.

[126] All unconscious contents, which either approach the threshold of consciousness from below, or have sunk only slightly beneath it, affect the conscious mind. Since the content does not appear as such in consciousness, these effects are necessarily indirect. Most of our “lapses”

are traceable to such disturbances, as are all neurotic symptoms, which are nearly always, in medical parlance, of a psychogenic nature, the exceptions being shock effects (shell-shock and the like). The mildest forms of neurosis are the lapses of consciousness mentioned above—e.g., slips of the tongue, suddenly forgetting names and dates, inadvertent clumsiness leading to injuries and accidents, misunderstandings and so-called hallucinations of memory, as when we think we have said something or done something, or faulty apprehension of things heard and said, and so on.

[127] In all these instances a thorough investigation can show the existence of some content which, in an indirect and unconscious way, is distorting the performance of the conscious mind.

[128] Generally speaking, therefore, an unconscious secret is more injurious than a conscious one. I have seen many patients who, as a result of difficult circumstances that might well have driven weaker natures to suicide, sometimes developed a suicidal tendency but, because of their inherent reasonableness, prevented it from becoming conscious and in this way generated an unconscious suicide-complex. This unconscious urge to suicide then engineered all kinds of dangerous accidents—as, for instance, a sudden attack of giddiness on some exposed place, hesitation in front of a motor-car, mistaking corrosive sublimate for cough mixture, a sudden zest for dangerous acrobatics, and so forth. When it was possible to make the suicidal leaning conscious in these cases, common sense could intervene as a salutary check: the patients could then consciously recognize and avoid the situations that tempted them to self-destruction.

[129] All personal secrets, therefore, have the effect of sin or guilt, whether or not they are, from the standpoint of popular morality, wrongful secrets.

[130] Another form of concealment is the act of holding something back. What we usually hold back are emotions or affects. Here too it must be stressed that self-restraint is healthy and beneficial; it may even be a virtue. That is why we find self-discipline to be one of the earliest moral arts even among primitive peoples, where it has its place in the initiation ceremonies, chiefly in the form of ascetic continence and the stoical

endurance of pain and fear. Self-restraint is here practised within a secret society as an undertaking shared with others. But if self-restraint is only a personal matter, unconnected with any religious views, it may become as injurious as the personal secret. Hence the well-known bad moods and irritability of the over-virtuous. The affect withheld is likewise something we conceal, something we can hide even from ourselves—an art in which men particularly excel, while women, with very few exceptions, are by nature averse to doing such injury to their affects. When an affect is withheld it is just as isolating and just as disturbing in its effects as the unconscious secret, and just as guilt-laden. In the same way that nature seems to bear us a grudge if we have the advantage of a secret over the rest of humanity, so she takes it amiss if we withhold our emotions from our fellow men. Nature decidedly abhors a vacuum in this respect; hence there is nothing more unendurable in the long run than a tepid harmony based on the withholding of affects. The repressed emotions are often of a kind we wish to keep secret. But more often there is no secret worth mentioning, only emotions which have become unconscious through being withheld at some critical juncture.

[131] The respective predominance of secrets or of inhibited emotions is probably responsible for the different forms of neurosis. At any rate the hysterical subject who is very free with his emotions is generally the possessor of a secret, while the hardened psychasthenic suffers from emotional indigestion.

[132] To cherish secrets and hold back emotion is a psychic misdemeanour for which nature finally visits us with sickness—that is, when we do these things in private. But when they are done in communion with others they satisfy nature and may even count as useful virtues. It is only restraint practised for oneself alone that is unwholesome. It is as if man had an inalienable right to behold all that is dark, imperfect, stupid, and guilty in his fellow men—for such, of course, are the things we keep secret in order to protect ourselves. It seems to be a sin in the eyes of nature to hide our inferiority—just as much as to live entirely on our inferior side. There would appear to be a sort of conscience in mankind which severely punishes every one who does not somehow and at some time, at whatever cost to his virtuous pride, cease to defend and assert

himself, and instead confess himself fallible and human. Until he can do this, an impenetrable wall shuts him off from the vital feeling that he is a man among other men.

[133] This explains the extraordinary significance of genuine, straightforward confession—a truth that was probably known to all the initiation rites and mystery cults of the ancient world. There is a saying from the Greek mysteries: "Give up what thou hast, and then thou wilt receive."

[134] We may well take this saying as a motto for the first stage in psychotherapeutic treatment. The beginnings of psychoanalysis are in fact nothing else than the scientific rediscovery of an ancient truth; even the name that was given to the earliest method—catharsis, or cleansing—is a familiar term in the classical rites of initiation. The early cathartic method consisted in putting the patient, with or without the paraphernalia of hypnosis, in touch with the hinterland of his mind, hence into that state which the yoga systems of the East describe as meditation or contemplation. In contrast to yoga, however, the aim here is to observe the sporadic emergence, whether in the form of images or of feelings, of those dim representations which detach themselves in the darkness from the invisible realm of the unconscious and move as shadows before the inturned gaze. In this way things repressed and forgotten come back again. This is a gain in itself, though often a painful one, for the inferior and even the worthless belongs to me as my shadow and gives me substance and mass. How can I be substantial without casting a shadow? I must have a dark side too if I am to be whole; and by becoming conscious of my shadow I remember once more that I am a human being like any other. At any rate, if this rediscovery of my own wholeness remains private, it will only restore the earlier condition from which the neurosis, i.e., the split-off complex, sprang. Privacy prolongs my isolation and the damage is only partially mended. But through confession I throw myself into the arms of humanity again, freed at last from the burden of moral exile. The goal of the cathartic method is full confession—not merely the intellectual recognition of the facts with the head, but their confirmation by the heart and the actual release of suppressed emotion.

[135] As may easily be imagined, the effect of such a confession on simple souls is very great, and its curative results are often astonishing. Yet I would not wish to see the main achievement of our psychology at this stage merely in the fact that some sufferers are cured, but rather in the systematic emphasis it lays upon the significance of confession. For this concerns us all. All of us are somehow divided by our secrets, but instead of seeking to cross the gulf on the firm bridge of confession, we choose the treacherous makeshift of opinion and illusion.

[136] Now I am far from wishing to enunciate a general maxim. It would be difficult to imagine anything more unsavoury than a wholesale confession of sin. Psychology simply establishes the fact that we have here a sore spot of first-rate importance. As the next stage, the stage of elucidation, will make clear, it cannot be tackled directly, because it is a problem with quite particularly pointed horns.

[137] It is of course obvious that the new psychology would have remained at the stage of confession had catharsis proved itself a panacea. First and foremost, however, it is not always possible to bring the patients close enough to the unconscious for them to perceive the shadows. On the contrary, many of them—and for the most part complicated, highly conscious persons—are so firmly anchored in consciousness that nothing can pry them loose. They develop the most violent resistances to any attempt to push consciousness aside; they want to talk with the doctor on the conscious plane and go into a rational explanation and discussion of their difficulties. They have quite enough to confess already, they say; they do not have to turn to the unconscious for that. For such patients a complete technique for approaching the unconscious is needed.

[138] This is one fact which at the outset seriously restricts the application of the cathartic method. The other restriction reveals itself later on and leads straight into the problems of the second stage. Let us suppose that in a given case the cathartic confession has occurred, the neurosis has vanished, or rather the symptoms are no longer visible. The patient could now be dismissed as cured—if it depended on the doctor alone. But he—or especially she–cannot get away. The patient seems bound to the doctor through the confession. If this seemingly senseless attachment is forcibly

severed, there is a bad relapse. Significantly enough, and most curiously, there are cases where no attachment develops; the patient goes away apparently cured, but he is now so fascinated by the hinterland of his own mind that he continues to practise catharsis on himself at the expense of his adaptation to life. He is bound to the unconscious, to himself, and not to the doctor. Clearly the same fate has befallen him as once befell Theseus and Peirithous his companion, who went down to Hades to bring back the goddess of the underworld. Tiring on the way, they sat down to rest for a while, only to find that they had grown fast to the rocks and could not rise.

[139] These curious and unforeseen mischances need elucidation just as much as the first-mentioned cases, those that proved inaccessible to catharsis. In spite of the fact that the two categories of patients are apparently quite different, elucidation is called for at precisely the same point—that is, where the problem of fixation arises, as was correctly recognized by Freud. This is immediately obvious with patients who have undergone catharsis, especially if they remain bound to the doctor. The same sort of thing had already been observed as the unpleasant result of hypnotic treatment, although the inner mechanisms of such a tie were not understood. It now turns out that the nature of the tie in question corresponds more or less to the relation between father and child. The patient falls into a sort of childish dependence from which he cannot defend himself even by rational insight. The fixation is at times extraordinarily powerful—its strength is so amazing that one suspects it of being fed by forces quite outside ordinary experience. Since the tie is the result of an unconscious process, the conscious mind of the patient can tell us nothing about it. Hence the question arises of how this new difficulty is to be met. Obviously we are dealing with a neurotic formation, a new symptom directly induced by the treatment. The unmistakable outward sign of the situation is that the “feeling-toned” memory-image of the father is transferred to the doctor, so that whether he likes it or not the doctor appears in the role of the father and thus turns the patient into a child. Naturally the patient’s childishness does not arise on that account—it was always present, but repressed. Now it comes to the surface, and—the long-lost father being found again—tries to restore

the family situation of childhood. Freud gave to this symptom the appropriate name of “transference.” That there should be a certain dependence on the doctor who has helped you is a perfectly normal and humanly understandable phenomenon. What is abnormal and unexpected is the extraordinary toughness of the tie and its imperviousness to conscious correction.

[140] It is one of Freud’s outstanding achievements to have explained the nature of this tie, or at least the biological aspects of it, and thus to have facilitated an important advance in psychological knowledge. Today it has been incontestably proved that the tie is caused by unconscious fantasies. These fantasies have in the main what we may call an “incestuous” character, which seems adequately to explain the fact that they remain unconscious, for we can hardly expect such fantasies, barely conscious at best, to come out even in the most scrupulous confession. Although Freud always speaks of incest-fantasies as though they were repressed, further experience has shown that in very many cases they were never the contents of the conscious mind at all or were conscious only as the vaguest adumbrations, for which reason they could not have been repressed intentionally. It is more probable that the incest-fantasies were always essentially unconscious and remained so until positively dragged into the light of day by the analytical method. This is not to say that fishing them out of the unconscious is a reprehensible interference with nature. It is something like a surgical operation on the psyche, but absolutely necessary inasmuch as the incest-fantasies are the cause of the transference and its complex symptoms, which are no less abnormal for being an artificial product.

[141] While the cathartic method restores to the ego such contents as are capable of becoming conscious and should normally be components of the conscious mind, the process of clearing up the transference brings to light contents which are hardly ever capable of becoming conscious in that form. This is the cardinal distinction between the stage of confession and the stage of elucidation.

[142] We spoke earlier of two categories of patients: those who prove impervious to catharsis and those who develop a fixation after catharsis.

We have just dealt with those whose fixation takes the form of transference. But, besides these, there are people who, as already mentioned, develop no attachment to the doctor but rather to their own unconscious, in which they become entangled as in a web. Here the parental imago is not transferred to any human object but remains a fantasy, although as such it exerts the same pull and results in the same tie as does the transference. The first category, the people who cannot yield themselves unreservedly to catharsis, can be understood in the light of Freudian research. Even before they came along for treatment they stood in an identity-relationship to their parents, deriving from it that authority, independence, and critical power which enabled them successfully to withstand the catharsis. They are mostly cultivated, differentiated personalities who, unlike the others, did not fall helpless victims to the unconscious activity of the parental imago, but rather usurped this activity by unconsciously identifying themselves with their parents.

[143] Faced with the phenomenon of transference, mere confession is of no avail; it was for this reason that Freud was driven to substantial modifications of Breuer's original cathartic method. What he now practised he called the "interpretative method."

[144] This further step is quite logical, for the transference relationship is in especial need of elucidation. How very much this is the case the layman can hardly appreciate; but the doctor who finds himself suddenly entangled in a web of incomprehensible and fantastic notions sees it all too clearly. He must interpret the transference—explain to the patient what he is projecting upon the doctor. Since the patient himself does not know what it is, the doctor is obliged to submit what scraps of fantasy he can obtain from the patient to analytical interpretation. The first and most important products of this kind are dreams. Freud therefore proceeded to examine dreams exclusively for their stock of wishes that had been repressed because incompatible with reality, and in the process discovered the incestuous contents of which I have spoken. Naturally the investigation revealed not merely incestuous material in the stricter sense of the word, but every conceivable kind of filth of which human nature is

capable—and it is notorious that a lifetime would be required to make even a rough inventory of it.

[145] The result of the Freudian method of elucidation is a minute elaboration of man’s shadow-side unexampled in any previous age. It is the most effective antidote imaginable to all the idealistic illusions about the nature of man; and it is therefore no wonder that there arose on all sides the most violent opposition to Freud and his school. I will not speak of the inveterate illusionists; I would merely point out that among the opponents of this method of explanation there are not a few who have no illusions about man’s shadow-side and yet object to a biased portrayal of man from the shadow-side alone. After all, the essential thing is not the shadow but the body which casts it.

[146] Freud’s interpretative method rests on “reductive” explanations which unfailingly lead backwards and downwards, and it is essentially destructive if overdone or handled one-sidedly. Nevertheless psychology has profited greatly from Freud’s pioneer work; it has learned that human nature has its black side—and not man alone, but his works, his institutions, and his convictions as well. Even our purest and holiest beliefs rest on very deep and dark foundations; after all, we can explain a house not only from the attic downwards, but from the basement upwards, and the latter explanation has the prime advantage of being genetically the more correct, since houses are in fact built bottom-side first, and the beginning of all things is simple and crude. No thinking person can deny that Salomon Reinach’s explanation of the Last Supper in terms of primitive totemism is fraught with significance; nor will he reject the application of the incest hypothesis to the myths of the Greek divinities. Certainly it pains our sensibilities to interpret radiant things from the shadow-side and thus in a measure trample them in the sorry dirt of their beginnings. But I hold it to be an imperfection in things of beauty, and a frailty in man, if anything of such a kind permit itself to be destroyed by a mere shadow-explanation. The uproar over Freud’s interpretations is entirely due to our own barbarous or childish naïveté, which does not yet understand that high rests on low, and that *les extrêmes se touchent* really is one of the ultimate verities. Our mistake lies in supposing that the radiant things are done away with by being

explained from the shadow-side. This is a regrettable error into which Freud himself has fallen. Shadow pertains to light as evil to good, and vice versa. Therefore I cannot lament the shock which this exposure administered to our occidental illusions and pettiness; on the contrary I welcome it as an historic and necessary rectification of almost incalculable importance. For it forces us to accept a philosophical relativism such as Einstein embodies for mathematical physics, and which is fundamentally a truth of the Far East whose ultimate effects we cannot at present foresee.

[147] Nothing, it is true, is less effective than an intellectual idea. But when an idea is a *psychic fact* that crops up in two such totally different fields as psychology and physics, apparently without historical connection, then we must give it our closest attention. For ideas of this kind represent forces which are logically and morally unassailable; they are always stronger than man and his brain. He fancies that he makes these ideas, but in reality they make him—and make him their unwitting mouthpiece.

[148] To return to our problem of fixation, I should now like to deal with the effects of elucidation. The fixation having been traced back to its dark origins, the patient's position becomes untenable; he cannot avoid seeing how inept and childish his demands are. He will either climb down from his exalted position of despotic authority to a more modest level and accept an insecurity which may prove very wholesome, or he will realize the inescapable truth that to make claims on others is a childish self-indulgence which must be replaced by a greater sense of responsibility.

[149] The man of insight will draw his own moral conclusions. Armed with the knowledge of his deficiencies, he will plunge into the struggle for existence and consume in progressive work and experience all those forces and longings which previously caused him to cling obstinately to a child's paradise, or at least to look back at it over his shoulder. Normal adaptation and forbearance with his own shortcomings: these will be his guiding moral principles, together with freedom from sentimentality and illusion. The inevitable result is a turning away from the unconscious as from a source of weakness and temptation—the field of moral and social defeat.

[150] The problem which now faces the patient is his education as a social being, and with this we come to the third stage. For many morally sensitive natures, mere insight into themselves has sufficient motive force to drive them forward, but it is not enough for people with little moral imagination. For them—to say nothing of those who may have been struck by the analyst’s interpretation but still doubt it in their heart of hearts—self-knowledge without the spur of external necessity is ineffective even when they are deeply convinced of its truth. Then again it is just the intellectually differentiated people who grasp the truth of the reductive explanation but cannot tolerate mere deflation of their hopes and ideals. In these cases, too, the power of insight will be of no avail. The explanatory method always presupposes sensitive natures capable of drawing independent moral conclusions from insight. It is true that elucidation goes further than uninterpreted confession alone, for at least it exercises the mind and may awaken dormant forces which can intervene in a helpful way. But the fact remains that in many cases the most thorough elucidation leaves the patient an intelligent but still incapable child. Moreover Freud’s cardinal explanatory principle in terms of pleasure and its satisfaction is, as further research has shown, one-sided and therefore unsatisfactory. Not everybody can be explained from this angle. No doubt we all have this angle, but it is not always the most important. We can give a starving man a beautiful painting; he would much prefer bread. We can nominate a languishing lover President of the United States; he would far rather wrap his arms round his adored. On the average, all those who have no difficulty in achieving social adaptation and social position are better accounted for by the pleasure principle than are the unadapted who, because of their social inadequacy, have a craving for power and importance. The elder brother who follows in his father’s footsteps and wins to a commanding position in society may be tormented by his desires; while the younger brother who feels himself suppressed and overshadowed by the other two may be goaded by ambition and the need for self-assertion. He may yield so completely to this passion that nothing else can become a problem for him, anyway not a vital one.

[151] At this point in Freud’s system of explanation there is a palpable gap, into which there stepped his one-time pupil, Adler. Adler has shown convincingly that numerous cases of neurosis can be far more satisfactorily explained by the power instinct than by the pleasure principle. The aim of his interpretation is therefore to show the patient that he “arranges” his symptoms and exploits his neurosis in order to achieve a fictitious importance; and that even his transference and his other fixations subserve the will to power and thus represent a “masculine protest” against imaginary suppression. Obviously Adler has in mind the psychology of the under-dog or social failure, whose one passion is self-assertion. Such individuals are neurotic because they always imagine they are hard done by and tilt at the windmills of their own fancy, thus putting the goal they most desire quite out of reach.

[152] Adler’s method begins essentially at the stage of elucidation; he explains the symptoms in the sense just indicated, and to that extent appeals to the patient’s understanding. Yet it is characteristic of Adler that he does not expect too much of understanding, but, going beyond that, has clearly recognized the need for social education. Whereas Freud is the investigator and interpreter, Adler is primarily the educator. He thus takes up the negative legacy which Freud bequeathed him, and, refusing to leave the patient a mere child, helpless despite his valuable understanding, tries by every device of education to make him a normal and adapted person. He does this evidently in the conviction that social adaptation and normalization are desirable goals, that they are absolutely necessary, the consummation of human life. From this fundamental attitude comes the widespread social activity of the Adlerian school, but also its depreciation of the unconscious, which, it seems, occasionally amounts to its complete denial. This is probably a swing of the pendulum—the inevitable reaction to the emphasis Freud lays on the unconscious, and as such quite in keeping with the natural aversion which we noted in patients struggling for adaptation and health. For, if the unconscious is held to be nothing more than a receptacle for all the evil shadow-things in human nature, including deposits of primeval slime, we really do not see why we should linger longer than necessary on the edge of this swamp into which we once fell. The scientific inquirer may behold a world of

wonders in a mud puddle, but for the ordinary man it is something best left alone. Just as early Buddhism had no gods because it had to free itself from an inheritance of nearly two million gods, so psychology, if it is to develop further, must leave behind so entirely negative a thing as Freud's conception of the unconscious. The educational aims of the Adlerian school begin precisely where Freud leaves off; consequently they meet the needs of the patient who, having come to understand himself, wants to find his way back to normal life. It is obviously not enough for him to know how his illness arose and whence it came, for we seldom get rid of an evil merely by understanding its causes. Nor should it be forgotten that the crooked paths of a neurosis lead to as many obstinate habits, and that for all our insight these do not disappear until replaced by other habits. But habits are won only by exercise, and appropriate education is the sole means to this end. The patient must be *drawn out* of himself into other paths, which is the true meaning of "education," and this can only be achieved by an educative will. We can therefore see why Adler's approach has found favour chiefly with clergymen and teachers, while Freud's approach is fancied by doctors and intellectuals, who are one and all bad nurses and educators.

[153] Each stage in the development of our psychology has something curiously final about it. Catharsis, with its heart-felt outpourings, makes one feel: "Now we are there, everything has come out, everything is known, the last terror lived through and the last tear shed; now everything will be all right." Elucidation says with equal conviction: "Now we know where the neurosis came from, the earliest memories have been unearthed, the last roots dug up, and the transference was nothing but the wish-fulfilling fantasy of a childhood paradise or a relapse into the family romance; the road to a normally disillusioned life is now open." Finally comes education, pointing out that no amount of confession and no amount of explaining can make the crooked plant grow straight, but that it must be trained upon the trellis of the norm by the gardener's art. Only then will normal adaptation be reached.

[154] This curious sense of finality which attends each of the stages accounts for the fact that there are people using cathartic methods today who have apparently never heard of dream interpretation, Freudians who

do not understand a word of Adler, and Adlerians who do not wish to know anything about the unconscious. Each is ensnared in the peculiar finality of his own stage, and thence arises that chaos of opinions and views which makes orientation in these troubled waters so exceedingly difficult.

[155] Whence comes the feeling of finality that evokes so much authoritarian bigotry on all sides?

[156] I can only explain it to myself by saying that each stage does in fact rest on a final truth, and that consequently there are always cases which demonstrate this particular truth in the most startling way. In our delusion-ridden world a truth is so precious that nobody wants to let it slip merely for the sake of a few so-called exceptions which refuse to toe the line. And whoever doubts this truth is invariably looked on as a faithless reprobate, so that a note of fanaticism and intolerance everywhere creeps into the discussion.

[157] And yet each of us can carry the torch of knowledge but a part of the way, until another takes it from him. If only we could understand all this impersonally—could understand that we are not the personal creators of our truths, but only their exponents, mere mouthpieces of the day's psychic needs, then much venom and bitterness might be spared and we should be able to perceive the profound and supra-personal continuity of the human mind.

[158] As a rule, we take no account of the fact that the doctor who practises catharsis is not just an abstraction which automatically produces nothing but catharsis. He is also a human being, and although his thinking may be limited to his special field, his actions exert the influence of a complete human being. Without giving it a name and without being clearly conscious of it, he unwittingly does his share of explanation and education, just as the others do their share of catharsis without raising it to the level of a principle.

[159] All life is living history. Even the reptile still lives in us *par sous-entendu*. In the same way, the three stages of analytical psychology so far dealt with are by no means truths of such a nature that the last of them

has gobbled up and replaced the other two. On the contrary, all three are salient aspects of one and the same problem, and they no more invalidate one another than do confession and absolution.

[160] The same is true of the fourth stage, transformation. It too should not claim to be the finally attained and only valid truth. It certainly fills a gap left by the earlier stages, but in so doing it merely fulfils a further need beyond the scope of the others.

[161] In order to make clear what this fourth stage has in view and what is meant by the somewhat peculiar term "transformation," we must first consider what psychic need was not given a place in the earlier stages. In other words, can anything lead further or be higher than the claim to be a normal and adapted social being? To be a normal human being is probably the most useful and fitting thing of which we can think; but the very notion of a "normal human being," like the concept of adaptation, implies a restriction to the average which seems a desirable improvement only to the man who already has some difficulty in coming to terms with the everyday world—a man, let us say, whose neurosis unfits him for normal life. To be "normal" is the ideal aim for the unsuccessful, for all those who are still below the general level of adaptation. But for people of more than average ability, people who never found it difficult to gain successes and to accomplish their share of the world's work—for them the moral compulsion to be nothing but normal signifies the bed of Procrustes—deadly and insupportable boredom, a hell of sterility and hopelessness. Consequently there are just as many people who become neurotic because they are merely normal, as there are people who are neurotic because they cannot become normal. That it should enter anyone's head to educate them to normality is a nightmare for the former, because their deepest need is really to be able to lead "abnormal" lives.

[162] A man can find satisfaction and fulfilment only in what he does not yet possess, just as he can never be satisfied with something of which he has already had too much. To be a social and adapted person has no charms for one to whom such an aspiration is child's play. Always to do the right thing becomes a bore for the man who knows how, whereas the

eternal bungler cherishes a secret longing to be right for once in some distant future.

[163] The needs and necessities of mankind are manifold. What sets one man free is another man’s prison. So also with normality and adaptation. Even if it be a biological axiom that man is a herd animal who only finds optimum health in living as a social being, the very next case may quite possibly invert this axiom and show us that he is completely healthy only when leading an abnormal and unsocial life. It is enough to drive one to despair that in practical psychology there are no universally valid recipes and rules. There are only individual cases with the most heterogeneous needs and demands—so heterogeneous that we can virtually never know in advance what course a given case will take, for which reason it is better for the doctor to abandon all preconceived opinions. This does not mean that he should throw them overboard, but that in any given case he should use them merely as hypotheses for a possible explanation. Not, however, in order to instruct or convince his patient, but rather to show how the doctor reacts to that particular individual. For, twist and turn the matter as we may, the relation between doctor and patient remains a personal one within the impersonal framework of professional treatment. By no device can the treatment be anything but the product of mutual influence, in which the whole being of the doctor as well as that of his patient plays its part. In the treatment there is an encounter between two irrational factors, that is to say, between two persons who are not fixed and determinable quantities but who bring with them, besides their more or less clearly defined fields of consciousness, an indefinitely extended sphere of non-consciousness. Hence the personalities of doctor and patient are often infinitely more important for the outcome of the treatment than what the doctor says and thinks (although what he says and thinks may be a disturbing or a healing factor not to be underestimated). For two personalities to meet is like mixing two different chemical substances: if there is any combination at all, both are transformed. In any effective psychological treatment the doctor is bound to influence the patient; but this influence can only take place if the patient has a reciprocal influence on the doctor. You can exert no influence if you are not susceptible to influence. It is futile for the doctor

to shield himself from the influence of the patient and to surround himself with a smoke-screen of fatherly and professional authority. By so doing he only denies himself the use of a highly important organ of information. The patient influences him unconsciously none the less, and brings about changes in the doctor's unconscious which are well known to many psychotherapists: psychic disturbances or even injuries peculiar to the profession, a striking illustration of the patient's almost "chemical" action. One of the best known symptoms of this kind is the counter-transference evoked by the transference. But the effects are often much more subtle, and their nature can best be conveyed by the old idea of the demon of sickness. According to this, a sufferer can transmit his disease to a healthy person whose powers then subdue the demon—but not without impairing the well-being of the subduer.

[164] Between doctor and patient, therefore, there are imponderable factors which bring about a mutual transformation. In the process, the stronger and more stable personality will decide the final issue. I have seen many cases where the patient assimilated the doctor in defiance of all theory and of the latter's professional intentions—generally, though not always, to the disadvantage of the doctor.

[165] The stage of transformation is grounded on these facts, but it took more than twenty-five years of wide practical experience for them to be clearly recognized. Freud himself has admitted their importance and has therefore seconded my demand for the analysis of the analyst.

[166] What does this demand mean? Nothing less than that the doctor is as much "in the analysis" as the patient. He is equally a part of the psychic process of treatment and therefore equally exposed to the transforming influences. Indeed, to the extent that the doctor shows himself impervious to this influence, he forfeits influence over the patient; and if he is influenced only unconsciously, there is a gap in his field of consciousness which makes it impossible for him to see the patient in true perspective. In either case the result of the treatment is compromised.

[167] The doctor is therefore faced with the same task which he wants his patient to face—that is, he must become socially adapted or, in the

reverse case, appropriately non-adapted. This therapeutic demand can of course be clothed in a thousand different formulae, according to the doctor's beliefs. One doctor believes in overcoming infantilism—therefore he must first overcome his own infantilism. Another believes in abreacting all affects—therefore he must first abreact all his own affects. A third believes in complete consciousness—therefore he must first reach consciousness of himself. The doctor must consistently strive to meet his own therapeutic demand if he wishes to ensure the right sort of influence over his patients. All these guiding principles of therapy make so many ethical demands, which can be summed up in the single truth: be the man through whom you wish to influence others. Mere talk has always been counted hollow, and there is no trick, however artful, by which this simple truth can be evaded in the long run. The fact of being convinced and not the thing we are convinced of—that is what has always, and at all times, worked.

[168] Thus the fourth stage of analytical psychology requires the counter-application to the doctor himself of whatever system is believed in—and moreover with the same relentlessness, consistency, and perseverance with which the doctor applies it to the patient.

[169] When one considers with what attentiveness and critical judgment the psychologist must keep track of his patients in order to show up all their false turnings, their false conclusions and infantile subterfuges, then it is truly no mean achievement for him to perform the same work upon himself. We are seldom interested enough in ourselves for that; moreover nobody pays us for our introspective efforts. Again, the common neglect into which the reality of the human psyche has fallen is still so great that self-examination or preoccupation with ourselves is deemed almost morbid. Evidently we suspect the psyche of harbouring something unwholesome, so that any concern with it smells of the sick-room. The doctor has to overcome these resistances in himself, for who can educate others if he is himself uneducated? Who can enlighten others if he is still in the dark about himself? And who purify others if himself impure?

[170] The step from education to self-education is a logical advance that completes the earlier stages. The demand made by the stage of

transformation, namely that the doctor must change himself if he is to become capable of changing his patient, is, as may well be imagined, a rather unpopular one, and for three reasons. First, because it seems unpractical; second, because of the unpleasant prejudice against being preoccupied with oneself; and third, because it is sometimes exceedingly painful to live up to everything one expects of one's patient. The last item in particular contributes much to the unpopularity of this demand, for if the doctor conscientiously doctors himself he will soon discover things in his own nature which are utterly opposed to normalization, or which continue to haunt him in the most disturbing way despite assiduous explanation and thorough abreaction. What is he to do about these things? He always knows what the patient should do about them—it is his professional duty to do so. But what, in all sincerity, will he do when they recoil upon himself or perhaps upon those who stand nearest to him? He may, in his self-investigations, discover some inferiority which brings him uncomfortably close to his patients and may even blight his authority. How will he deal with this painful discovery? This somewhat "neurotic" question will touch him on the raw, no matter how normal he thinks he is. He will also discover that the ultimate questions which worry him as much as his patients cannot be solved by any treatment, that to expect solutions from others is childish and keeps you childish, and that if no solution can be found the question must be repressed again.

[171] I will not pursue any further the many problems raised by self-examination because, owing to the obscurity which still surrounds the psyche, they would be of little interest today.

[172] Instead, I would like to emphasize once again that the newest developments in analytical psychology confront us with the imponderable elements in the human personality; that we have learned to place in the foreground the personality of the doctor himself as a curative or harmful factor; and that what is now demanded is his own transformation—the self-education of the educator. Consequently, everything that occurred on the objective level in the history of our psychology—confession, elucidation, education—passes to the subjective level; in other words, what happened to the patient must now happen to the doctor, so that his personality shall not react unfavourably

on the patient. The doctor can no longer evade his own difficulty by treating the difficulties of others: the man who suffers from a running abscess is not fit to perform a surgical operation.

[173] Just as the momentous discovery of the unconscious shadow-side in man suddenly forced the Freudian school to deal even with questions of religion, so this latest advance makes an unavoidable problem of the doctor’s ethical attitude. The self-criticism and self-examination that are indissolubly bound up with it necessitates a view of the psyche radically different from the merely biological one which has prevailed hitherto; for the human psyche is far more than a mere object of scientific interest. It is not only the sufferer but the doctor as well, not only the object but also the subject, not only a cerebral function but the absolute condition of consciousness itself.

[174] What was formerly a method of medical treatment now becomes a method of self-education, and with this the horizon of our psychology is immeasurably widened. The crucial thing is no longer the medical diploma, but the human quality. This is a significant turn of events, for it places all the implements of the psychotherapeutic art that were developed in clinical practice, and then refined and systematized, at the service of our self-education and self-perfection, with the result that analytical psychology has burst the bonds which till then had bound it to the consulting-room of the doctor. It goes beyond itself to fill the hiatus that has hitherto put Western civilization at a psychic disadvantage as compared with the civilizations of the East. We Westerners knew only how to tame and subdue the psyche; we knew nothing about its methodical development and its functions. Our civilization is still young, and young civilizations need all the arts of the animal-tamer to make the defiant barbarian and the savage in us more or less tractable. But at a higher cultural level we must forgo compulsion and turn to self-development. For this we must have a way, a method, which, as I said, has so far been lacking. It seems to me that the findings and experiences of analytical psychology can at least provide a foundation, for as soon as psychotherapy takes the doctor himself for its subject, it transcends its medical origins and ceases to be merely a method for treating the sick. It now treats the healthy or such as have a moral right to psychic health,

whose sickness is at most the suffering that torments us all. For this reason analytical psychology can claim to serve the common weal—more so even than the previous stages which are each the bearer of a general truth. But between this claim and present-day reality there lies a gulf, with no bridge leading across. We have yet to build that bridge stone by stone.

VI

PSYCHOTHERAPY AND A PHILOSOPHY OF LIFE[1]

[175] So much is psychotherapy the child of practical improvisation that for a long time it had trouble in thinking out its own intellectual foundations. Empirical psychology relied very much at first on physical and then on physiological ideas, and ventured only with some hesitation on the complex phenomena which constitute its proper field. Similarly, psychotherapy was at first simply an auxiliary method; only gradually did it free itself from the world of ideas represented by medical therapeutics and come to understand that its concern lay not merely with physiological but primarily with psychological principles. In other words, it found itself obliged to raise psychological issues which soon burst the framework of the experimental psychology of that day with its elementary statements. The demands of therapy brought highly complex factors within the purview of this still young science, and its exponents very often lacked the equipment needed to deal with the problems that arose. It is therefore not surprising that a bewildering assortment of ideas, theories, and points of view predominated in all the initial discussions of this new psychology which had been, so to speak, forced into existence by therapeutic experience. An outsider could hardly be blamed if he received an impression of babel. This confusion was inevitable, for sooner or later it was bound to become clear that one cannot treat the psyche without touching on man and life as a whole, including the ultimate and deepest issues, any more than one can treat the sick body without regard to the totality of its functions—or rather, as a few representatives of modern medicine maintain, the totality of the sick man himself.

[176] The more “psychological” a condition is, the greater its complexity and the more it relates to the whole of life. It is true that elementary psychic phenomena are closely allied to physiological processes, and

there is not the slightest doubt that the physiological factor forms at least one pole of the psychic cosmos. The instinctive and affective processes, together with all the neurotic symptomatology that arises when these are disturbed, clearly rest on a physiological basis. But, on the other hand, the disturbing factor proves equally clearly that it has the power to turn physiological order into disorder. If the disturbance lies in a repression, then the disturbing factor—that is, the repressive force—belongs to a "higher" psychic order. It is not something elementary and physiologically conditioned, but, as experience shows, a highly complex determinant, as for example certain rational, ethical, aesthetic, religious, or other traditional ideas which cannot be scientifically proved to have any physiological basis. These extremely complex dominants form the other pole of the psyche. Experience likewise shows that this pole possesses an energy many times greater than that of the physiologically conditioned psyche.

[177] With its earliest advances into the field of psychology proper, the new psychotherapy came up against the problem of opposites—a problem that is profoundly characteristic of the psyche. Indeed, the structure of the psyche is so contradictory or contrapuntal that one can scarcely make any psychological assertion or general statement without having immediately to state its opposite.

[178] The problem of opposites offers an eminently suitable and ideal battleground for the most contradictory theories, and above all for partially or wholly unrealized prejudices regarding one's philosophy of life. With this development psychotherapy stirred up a hornets' nest of the first magnitude. Let us take as an example the supposedly simple case of a repressed instinct. If the repression is lifted, the instinct is set free. Once freed, it wants to live and function in its own way. But this creates a difficult—sometimes intolerably difficult—situation. The instinct ought therefore to be modified, or "sublimated," as they say. How this is to be done without creating a new repression nobody can quite explain. The little word "ought" always proves the helplessness of the therapist; it is an admission that he has come to the end of his resources. The final appeal to reason would be very fine if man were by nature a rational animal, but he is not; on the contrary, he is quite as much irrational.

Hence reason is often not sufficient to modify the instinct and make it conform to the rational order. Nobody can conceive the moral, ethical, philosophical, and religious conflicts that crop up at this stage of the problem—the facts surpass all imagination. Every conscientious and truth-loving psychotherapist could tell a tale here, though naturally not in public. All the contemporary problems, all the philosophical and religious questionings of our day, are raked up, and unless either the psychotherapist or the patient abandons the attempt in time it is likely to get under both their skins. Each will be driven to a discussion of his philosophy of life, both with himself and with his partner. There are of course forced answers and solutions, but in principle and in the long run they are neither desirable nor satisfying. No Gordian knot can be permanently cut; it has the awkward property of always tying itself again.

[179] This philosophical discussion is a task which psychotherapy necessarily sets itself, though not every patient will come down to basic principles. The question of the measuring rod with which to measure, of the ethical criteria which are to determine our actions, must be answered somehow, for the patient may quite possibly expect us to account for our judgments and decisions. Not all patients allow themselves to be condemned to infantile inferiority because of our refusal to render such an account, quite apart from the fact that a therapeutic blunder of this kind would be sawing off the branch on which we sit. In other words, the art of psychotherapy requires that the therapist be in possession of avowable, credible, and defensible convictions which have proved their viability either by having resolved any neurotic dissociations of his own or by preventing them from arising. A therapist with a neurosis is a contradiction in terms. One cannot help any patient to advance furthe. than one has advanced oneself. On the other hand, the possession of complexes does not in itself signify neurosis, for complexes are the normal foci of psychic happenings, and the fact that they are painful is no proof of pathological disturbance. Suffering is not an illness; it is the normal counterpole to happiness. A complex becomes pathological only when we think we have not got it.

[180] As the most complex of psychic structures, a man's philosophy of life forms the counterpole to the physiologically conditioned psyche, and, as

the highest psychic dominant, it ultimately determines the latter's fate. It guides the life of the therapist and shapes the spirit of his therapy. Since it is an essentially subjective system despite the most rigorous objectivity, it may and very likely will be shattered time after time on colliding with the truth of the patient, but it rises again, rejuvenated by the experience. Conviction easily turns into self-defence and is seduced into rigidity, and this is inimical to life. The test of a firm conviction is its elasticity and flexibility; like every other exalted truth it thrives best on the admission of its errors.

[181] I can hardly draw a veil over the fact that we psychotherapists ought really to be philosophers or philosophic doctors—or rather that we already are so, though we are unwilling to admit it because of the glaring contrast between our work and what passes for philosophy in the universities. We could also call it religion *in statu nascendi*, for in the vast confusion that reigns at the roots of life there is no line of division between philosophy and religion. Nor does the unrelieved strain of the psychotherapeutic situation, with its host of impressions and emotional disturbances, leave us much leisure for the systematization of thought. Thus we have no clear exposition of guiding principles drawn from life to offer either to the philosophers or to the theologians.

[182] Our patients suffer from bondage to a neurosis, they are prisoners of the unconscious, and if we attempt to penetrate with understanding into that realm of unconscious forces, we have to defend ourselves against the same influences to which our patients have succumbed. Like doctors who treat epidemic diseases, we expose ourselves to powers that threaten our conscious equilibrium, and we have to take every possible precaution if we want to rescue not only our own humanity but that of the patient from the clutches of the unconscious. Wise self-limitation is not the same thing as text-book philosophy, nor is an ejaculatory prayer in a moment of mortal danger a theological treatise. Both are the outcome of a religious and philosophical attitude that is appropriate to the stark dynamism of life.

[183] The highest dominant always has a religious or a philosophical character. It is by nature extremely primitive, and consequently we find it

in full development among primitive peoples. Any difficulty, danger, or critical phase of life immediately calls forth this dominant. It is the most natural reaction to all highly charged emotional situations. But often it remains as obscure as the semiconscious emotional situation which evoked it. Hence it is quite natural that the emotional disturbances of the patient should activate the corresponding religious or philosophical factors in the therapist. Often he is most reluctant to make himself conscious of these primitive contents, and he quite understandably prefers to turn for help to a religion or philosophy which has reached his consciousness from outside. This course does not strike me as being illegitimate in so far as it gives the patient a chance to take his place within the structure of some protective institution existing in the outside world. Such a solution is entirely natural, since there have always and everywhere been totem clans, cults, and creeds whose purpose it is to give an ordered form to the chaotic world of the instincts.

[184] The situation becomes difficult, however, when the patient's nature resists a collective solution. The question then arises whether the therapist is prepared to risk having his convictions dashed and shattered against the truth of the patient. If he wants to go on treating the patient he must abandon all preconceived notions and, for better or worse, go with him in search of the religious and philosophical ideas that best correspond to the patient's emotional states. These ideas present themselves in archetypal form, freshly sprung from the maternal soil whence all religious and philosophical systems originally came. But if the therapist is not prepared to have his convictions called in question for the sake of the patient, then there is some reason for doubting the stability of his basic attitude. Perhaps he cannot give way on grounds of self-defence, which threatens him with rigidity. The margin of psychological elasticity varies both individually and collectively, and often it is so narrow that a certain degree of rigidity really does represent the maximum achievement. *Ultra posse nemo obligatur*.

[185] Instinct is not an isolated thing, nor can it be isolated in practice. It always brings in its train archetypal contents of a spiritual nature, which are at once its foundation and its limitation. In other words, an instinct is always and inevitably coupled with something like a philosophy of life,

however archaic, unclear, and hazy this may be. Instinct stimulates thought, and if a man does not think of his own free will, then you get compulsive thinking, for the two poles of the psyche, the physiological and the mental, are indissolubly connected. For this reason instinct cannot be freed without freeing the mind, just as mind divorced from instinct is condemned to futility. Not that the tie between mind and instinct is necessarily a harmonious one. On the contrary it is full of conflict and means suffering. Therefore the principal aim of psychotherapy is not to transport the patient to an impossible state of happiness, but to help him acquire steadfastness and philosophic patience in face of suffering. Life demands for its completion and fulfilment a balance between joy and sorrow. But because suffering is positively disagreeable, people naturally prefer not to ponder how much fear and sorrow fall to the lot of man. So they speak soothingly about progress and the greatest possible happiness, forgetting that happiness is itself poisoned if the measure of suffering has not been fulfilled. Behind a neurosis there is so often concealed all the natural and necessary suffering the patient has been unwilling to bear. We can see this most clearly from hysterical pains, which are relieved in the course of treatment by the corresponding psychic suffering which the patient sought to avoid.

[186] The Christian doctrine of original sin on the one hand, and of the meaning and value of suffering on the other, is therefore of profound therapeutic significance and is undoubtedly far better suited to Western man than Islamic fatalism. Similarly the belief in immortality gives life that untroubled flow into the future so necessary if stoppages and regressions are to be avoided. Although we like to use the word “doctrine” for these—psychologically speaking—extremely important ideas, it would be a great mistake to think that they are just arbitrary intellectual theories. Psychologically regarded, they are emotional experiences whose nature cannot be discussed. If I may permit myself a banal comparison, when I feel well and content nobody can prove to me that I am not. Logical arguments simply bounce off the facts felt and experienced. Original sin, the meaning of suffering, and immortality are emotional facts of this kind. But to experience them is a charisma which

no human art can compel. Only unreserved surrender can hope to reach such a goal.

[187] Not everybody is capable of this surrender. There is no "ought" or "must" about it, for the very act of exerting the will inevitably places such an emphasis on *my* will to surrender that the exact opposite of surrender results. The Titans could not take Olympus by storm, and still less may a Christian take Heaven. The most healing, and psychologically the most necessary, experiences are a "treasure hard to attain," and its acquisition demands something out of the common from the common man.

[188] As we know, this something out of the common proves, in practical work with the patient, to be an invasion by archetypal contents. If these contents are to be assimilated, it is not enough to make use of the current philosophical or religious ideas, for they simply do not fit the archaic symbolism of the material. We are therefore forced to go back to pre-Christian and non-Christian conceptions and to conclude that Western man does not possess the monopoly of human wisdom and that the white race is not a species of *Homo sapiens* specially favoured by God. Moreover we cannot do justice to certain contemporary collective phenomena unless we revert to the pre-Christian parallels.

[189] Medieval physicians seem to have realized this, for they practised a philosophy whose roots can be traced back to pre-Christian times and whose nature exactly corresponds to our experiences with patients today. These physicians recognized, besides the light of divine revelation, a *lumen naturae* as a second, independent source of illumination, to which the doctor could turn if the truth as handed down by the Church should for any reason prove ineffective either for himself or for the patient.

[190] It was eminently practical reasons, and not the mere caperings of a hobby-horse, that prompted me to undertake my historical researches. Neither our modern medical training nor academic psychology and philosophy can equip the doctor with the necessary education, or with the means, to deal effectively and understandingly with the often very urgent demands of his psychotherapeutic practice. It therefore behoves us, unembarrassed by our shortcomings as amateurs of history, to go to

school once more with the medical philosophers of a distant past, when body and soul had not yet been wrenched asunder into different faculties. Although we are specialists par excellence, our specialized field, oddly enough, drives us to universalism and to the complete overcoming of the specialist attitude, if the totality of body and soul is not to be just a matter of words. Once we have made up our minds to treat the soul, we can no longer close our eyes to the fact that neurosis is not a thing apart but the whole of the pathologically disturbed psyche. It was Freud’s momentous discovery that the neurosis is not a mere agglomeration of symptoms, but a wrong functioning which affects the whole psyche. The important thing is not the neurosis, but the man who has the neurosis. We have to set to work on the human being, and we must be able to do him justice as a human being.

[191] The conference we are holding today proves that our psychotherapy has recognized its aim, which is to pay equal attention to the physiological and to the spiritual factor. Originating in natural science, it applies the objective, empirical methods of the latter to the phenomenology of the mind. Even if this should remain a mere attempt, the fact that the attempt has been made is of incalculable significance.

VII

MEDICINE AND PSYCHOTHERAPY[1]

[192] Speaking before an audience of doctors, I always experience a certain difficulty in bridging the differences that exist between medicine on the one hand and psychotherapy on the other in their conception of pathology. These differences are the source of numerous misunderstandings, and it is therefore of the greatest concern to me, in this short talk, to express one or two thoughts which may serve to clarify the special relationship that psychotherapy bears to medicine. Where distinctions exist, well-meaning attempts to stress the common ground are notoriously lacking in point. But it is extremely important. in his own interests, that the psychotherapist should not in any circumstances lose the position he originally held in medicine, and this precisely because the peculiar nature of his experience forces upon him a certain mode of thought, and certain interests, which no longer have—or perhaps I should say, do not yet have—a rightful domicile in the medicine of today. Both these factors tend to lead the psychotherapist into fields of study apparently remote from medicine, and the practical importance of these fields is generally difficult to explain to the non-psychotherapist. From accounts of case histories and miraculously successful cures the non-psychotherapist learns little, and that little is frequently false. I have yet to come across a respectable specimen of neurosis of which one could give anything like an adequate description in a short lecture, to say nothing of all the therapeutic intricacies that are far from clear even to the shrewdest professional.

[193] With your permission I will now examine the three stages of medical procedure—anamnesis, diagnosis, and therapy—from the psychotherapeutic point of view. The pathological material I am here presupposing is pure psychoneurosis.

[194] We begin with the anamnesis, as is customary in medicine in general and psychiatry in particular—that is to say, we try to piece together the historical facts of the case as flawlessly as possible. The psychotherapist, however, does not rest content with these facts. He is aware not only of the unreliability of all evidence, but, over and above that, of the special sources of error in statements made on one's own behalf—the statements of the patient who, wittingly or unwittingly, gives prominence to facts that are plausible enough in themselves but may be equally misleading as regards the pathogenesis. The patient's whole environment may be drawn into this system of explanation in a positive or negative sense, as though it were in unconscious collusion with him. At all events one must be prepared *not* to hear the very things that are most important. The psychotherapist will therefore take pains to ask questions about matters that seem to have nothing to do with the actual illness. For this he needs not only his professional knowledge; he has also to rely on intuitions and sudden ideas, and the more widely he casts his net of questions the more likely he is to succeed in catching the complex nature of the case. If ever there were an illness that cannot be localized, because it springs from the whole of a man, that illness is a psychoneurosis. The psychiatrist can at least console himself with diseases of the brain; not so the psychotherapist, even if he privately believes in such a maxim, for the case before him demands the thorough psychological treatment of a disturbance that has nothing to do with cerebral symptoms. On the contrary, the more the psychotherapist allows himself to be impressed by hereditary factors and the possibility of psychotic complications, the more crippled he will be in his therapeutic action. For better or worse he is obliged to overlook such cogent factors as heredity, the presence of schizophrenic symptoms, and the like, particularly when these dangerous things are put forward with special emphasis. His assessment of anainnestic data may therefore turn out to be very different from a purely medical one.

[195] It is generally assumed in medical circles that the examination of the patient should lead to the diagnosis of his illness, so far as this is possible at all, and that with the establishment of the diagnosis an important decision has been arrived at as regards prognosis and therapy.

Psychotherapy forms a startling exception to this rule: the diagnosis is a highly irrelevant affair since, apart from affixing a more or less lucky label to a neurotic condition, nothing is gained by it, least of all as regards prognosis and therapy. In flagrant contrast to the rest of medicine, where a definite diagnosis is often, as it were, logically followed by a specific therapy and a more or less certain prognosis, the diagnosis of any particular psychoneurosis means, at most, that some form of psychotherapy is indicated. As to the prognosis, this is in the highest degree independent of the diagnosis. Nor should we gloss over the fact that the classification of the neuroses is very unsatisfactory, and that for this reason alone a specific diagnosis seldom means anything real. In general, it is enough to diagnose a "psychoneurosis" as distinct from some organic disturbance—the word means no more than that. I have in the course of years accustomed myself wholly to disregard the diagnosing of specific neuroses, and I have sometimes found myself in a quandary when some word-addict urged me to hand him a specific diagnosis. The Greco-Latin compounds needed for this still seem to have a not inconsiderable market value and are occasionally indispensable for that reason.

[196] The sonorous diagnosis of neuroses *secundum ordinem* is just a façade; it is not the psychotherapist's real diagnosis. His establishment of certain facts might conceivably be called "diagnosis," though it is psychological rather than medical in character. Nor is it meant to be communicated; for reasons of discretion, and also on account of the subsequent therapy, he usually keeps it to himself. The facts so established are simply perceptions indicating the direction the therapy is to take. They can hardly be reproduced in the sort of Latin terminology that sounds scientific; but there are on the other hand expressions of ordinary speech which adequately describe the essential psychotherapeutic facts. The point is, we are not dealing with clinical diseases but with psychological ones. Whether a person is suffering from hysteria, or an anxiety neurosis, or a phobia, means little beside the much more important discovery that, shall we say, he is *fils à papa*. Here something fundamental has been said about the content of the neurosis and about the difficulties to be expected in the treatment. So that in

psychotherapy the recognition of disease rests much less on the clinical picture than on the content of complexes. Psychological diagnosis aims at the diagnosis of complexes and hence at the formulation of facts which are far more likely to be concealed than revealed by the clinical picture. The real toxin is to be sought in the complex, and this is a more or less autonomous psychic quantity. It proves its autonomous nature by not fitting into the hierarchy of the conscious mind, or by the resistance it successfully puts up against the will. This fact, which can easily be established by experiment, is the reason why psychoneuroses and psychoses have from time immemorial been regarded as states of *possession*, since the impression forces itself upon the naïve observer that the complex forms something like a shadow-government of the ego.

[197] The content of a neurosis can never be established by a single examination, or even by several. It manifests itself only in the course of treatment. Hence the paradox that the true psychological diagnosis becomes apparent only at the end. Just as a sure diagnosis is desirable and a thing to be aimed at in medicine, so, conversely, it will profit the psychotherapist to know as little as possible about specific diagnoses. It is enough if he is reasonably sure of the differential diagnosis between organic and psychic, and if he knows what a genuine melancholy is and what it can mean. Generally speaking, the less the psychotherapist knows in advance, the better the chances for the treatment. Nothing is more deleterious than a routine understanding of everything.

[198] We have now established that the anamnesis appears more than usually suspect to the psychotherapist, and that clinical diagnosis is, for his purposes, well-nigh meaningless. Finally, the therapy itself shows the greatest imaginable departures from the views commonly accepted in medicine. There are numerous physical diseases where the diagnosis also lays down the lines for a specific treatment; a given disease cannot be treated just anyhow. But for the psychoneuroses the only valid principle is that their treatment must be psychological. In this respect there is any number of methods, rules, prescriptions, views, and doctrines, and the remarkable thing is that any given therapeutic procedure in any given neurosis can have the desired result. The various psychotherapeutic dogmas about which such a great fuss is made do not, therefore, amount

to very much in the end. Every psychotherapist who knows his job will, consciously or unconsciously, theory notwithstanding, ring all the changes that do not figure in his own theory. He will occasionally use suggestion, to which he is opposed on principle. There is no getting round Freud's or Adler's or anybody else's point of view. Every psychotherapist not only has his own method–he himself is that method. *Ars requirit totum hominem*, says an old master. The great healing factor in psychotherapy is the doctor's personality, which is something not given at the start; it represents his performance at its highest and not a doctrinaire blueprint. Theories are to be avoided, except as mere auxiliaries. As soon as a dogma is made of them, it is evident that an inner doubt is being stifled. Very many theories are needed before we can get even a rough picture of the psyche's complexity. It is therefore quite wrong when people accuse psychotherapists of being unable to reach agreement even on their own theories. Agreement could only spell one-sidedness and desiccation. One could as little catch the psyche in a theory as one could catch the world. Theories are not articles of faith, they are either instruments of knowledge and of therapy, or they are no good at all.

[199] Psychotherapy can be practised in a great variety of ways, from psychoanalysis, or something of that kind, to hypnotism, and so on right down to cataplasms of honey and possets of bat's dung. Successes can be obtained with them all. So at least it appears on a superficial view. On closer inspection, however, one realizes that the seemingly absurd remedy was exactly the right thing, not for this particular *neurosis*, but for this particular human being, whereas in another case it would have been the worst thing possible. Medicine too is doubtless aware that sick people exist as well as sicknesses; but psychotherapy knows first and foremost—or rather should know—that its proper concern is not the fiction of a neurosis but the distorted totality of the human being. True, it too has tried to treat neurosis like an *ulcus cruris*, where it matters not a jot for the treatment whether the patient was the apple of her father's eye or whether she is a Catholic, a Baptist, or what not; whether the man she married be old or young, and all the rest of it. Psychotherapy began by attacking the symptom, just as medicine did. Despite its undeniable

youthfulness as a scientifically avowable method, it is yet as old as the healing art itself and, consciously or otherwise, has always remained mistress of at least half the medical field. Certainly its real advances were made only in the last half century when, on account of the specialization needed, it withdrew to the narrower field of the psychoneuroses. But here it recognized relatively quickly that to attack symptoms or, as it is now called, symptom analysis was only half the story, and that the real point is the treatment of the whole psychic human being.

[200] What does this mean: the whole psychic human being?

[201] Medicine in general has to deal, in the first place, with man as an anatomical and physiological phenomenon, and only to a lesser degree with the human being psychically defined. But this precisely is the subject of psychotherapy. When we direct our attention to the psyche from the viewpoint of the natural sciences, it appears as one biological factor among many others. In man this factor is usually identified with the conscious mind, as has mostly been done up to now by the so-called humane sciences as well. I subscribe entirely to the biological view that the psyche is one such factor, but at the same time I am given to reflect that the psyche—in this case, consciousness–occupies an exceptional position among all these biological factors. For without consciousness it would never have become known that there is such a thing as a world, and without the psyche there would be absolutely no possibility of knowledge, since the object must go through a complicated physiological and psychic process of change in order to become a psychic image. This image alone is the immediate object of knowledge. The existence of the world has two conditions: it to exist, and us to know it.

[202] Now, whether the psyche is understood as an epiphenomenon of the living body, or as an *ens per se*, makes little difference to psychology, in so far as the psyche knows itself to exist and behaves as such an existent, having its own phenomenology which can be replaced by no other. Thereby it proves itself to be a biological factor that can be described phenomenologically like any other object of natural science. The beginnings of a phenomenology of the psyche lie in psychophysiology and experimental psychology on the one hand, and, on the other, in

descriptions of diseases and the diagnostic methods of psychopathology (e.g., association experiments and Rorschach’s irrational ink-blots). But the most convincing evidence is to be found in every manifestation of psychic life, in the humane sciences, religious and political views and movements, the arts, and so forth.

[203] The “whole psychic human being” we were asking about thus proves to be nothing less than a world, that is, a microcosm, as the ancients quite rightly thought, though for the wrong reasons. The psyche reflects, and knows, the whole of existence, and everything works in and through the psyche.

[204] But in order to get a real understanding of this, we must very considerably broaden our conventional conception of the psyche. Our original identification of psyche with the conscious mind does not stand the test of empirical criticism. The medical philosopher C. G. Carus had a clear inkling of this and was the first to set forth an explicit philosophy of the unconscious. Today he would undoubtedly have been a psychotherapist. But in those days the psyche was still the anxiously guarded possession of philosophy and therefore could not be discussed within the framework of medicine, although the physicians of the Romantic Age tried all sorts of unorthodox experiments in this respect. I am thinking chiefly of Justinus Kerner. It was reserved for the recent past to fill in the gaps in the conscious processes with hypothetical unconscious ones. The existence of an unconscious psyche is as likely, shall we say, as the existence of an as yet undiscovered planet, whose presence is inferred from the deviations of some known planetary orbit. Unfortunately we lack the aid of the telescope that would make certain of its existence. But once the idea of the unconscious was introduced, the concept of the psyche could be expanded to the formula “psyche = ego-consciousness + unconscious.”

[205] The unconscious was understood personalistically at first—that is to say, its contents were thought to come exclusively from the sphere of ego-consciousness and to have become unconscious only secondarily, through repression. Freud later admitted the existence of archaic vestiges in the unconscious, but thought they had more or less the significance of

anatomical atavisms. Consequently we were still far from an adequate conception of the unconscious. Certain things had yet to be discovered, although actually they lay ready to hand: above all the fact that in every child consciousness grows out of the unconscious in the course of a few years, also that consciousness is always only a temporary state based on an optimum physiological performance and therefore regularly interrupted by phases of unconsciousness (sleep), and finally that the unconscious psyche not only possesses the longer lease of life but is continuously present. From this arises the important conclusion that the real and authentic psyche is the unconscious, whereas the ego-consciousness can be regarded only as a temporary epiphenomenon.

[206] In ancient times the psyche was conceived as a microcosm, and this was one of the characteristics attributed to the psychophysical man. To attribute such a characteristic to the ego-consciousness would be boundlessly to overestimate the latter. But with the unconscious it is quite different. This, by definition and in fact, cannot be circumscribed. It must therefore be counted as something boundless: infinite or infinitesimal. Whether it may legitimately be called a microcosm depends simply and solely on whether certain portions of the world beyond individual experience can be shown to exist in the unconscious—certain constants which are not individually acquired but are *a priori* presences. The theory of instinct and the findings of biology in connection with the symbiotic relationship between plant and insect have long made us familiar with these things. But when it comes to the psyche one is immediately seized with the fear of having to do with “inherited ideas.” We are not dealing with anything of the sort; it is more a question of *a priori* or prenatally determined modes of behaviour and function. It is to be conjectured that just as the chicken comes out of the egg in the same way all the world over, so there are psychic modes of functioning, certain ways of thinking, feeling, and imagining, which can be found everywhere and at all times, quite independent of tradition. A general proof of the rightness of this expectation lies in the ubiquitous occurrence of parallel mythologems, Bastian’s “folk-thoughts” or primordial ideas; and a special proof is the autochthonous reproduction of such ideas in the psyche of individuals where direct transmission is out of the question.

The empirical material found in such cases consists of dreams, fantasies, delusions, etc.

[207] Mythologems are the aforementioned “portions of the world” which belong to the structural elements of the psyche. They are constants whose expression is everywhere and at all times the same.

[208] You may ask in some consternation: What has all this to do with psychotherapy? That neuroses are somehow connected with instinctual disturbances is not surprising. But, as biology shows, instincts are by no means blind, spontaneous, isolated impulses; they are on the contrary associated with typical situational patterns and cannot be released unless existing conditions correspond to the *a priori* pattern. The collective contents expressed in mythologems represent such situational patterns. which are so intimately connected with the release of instinct. For this reason knowledge of them is of the highest practical importance to the psychotherapist.

[209] Clearly, the investigation of these patterns and their properties must lead us into fields that seem to lie infinitely far from medicine. That is the fate of empirical psychology, and its misfortune: to tall between all the academic stools. And this comes precisely from the fact that the human psyche has a share in all the sciences, because it forms at least half the ground necessary for the existence of them all.

[210] It should be clear from the foregoing discussion that everything psychotherapy has in common with symptomatology clinically understood—i.e., with the medical picture—is, I will not say irrelevant, but of secondary importance in so far as the medical picture of disease is a provisional one. The real and important thing is the psychological picture, which can only be discovered in the course of treatment behind the veil of pathological symptoms. In order to get closer to the sphere of the psyche, the ideas derived from the sphere of medicine are not enough. But, to the extent that psychotherapy, considered as part of the healing art, should never, for many cogent reasons, slip out of the doctor’s control and should therefore be taught in medical faculties, it is forced to borrow from the other sciences—which is what other medical disciplines have been doing for a long time. Yet whereas medicine in general can

limit its borrowings to the natural sciences, psychotherapy needs the help of the humane sciences as well.

[211] In order to complete my account of the differences between medicine and psychotherapy, I ought really to describe the phenomenology of those psychic processes which manifest themselves in the course of treatment and do not have their counterpart in medicine. But such an undertaking would exceed the compass of my lecture, and I must therefore refrain. I trust, however, that the little I have been privileged to say has thrown some light on the relations between psychotherapy and the medical art.

VIII

PSYCHOTHERAPY TODAY[1]

[212] It would be a rewarding task to examine in some detail the relationship between psychotherapy and the state of mind in Europe today. Yet probably no one would be blamed for shrinking from so bold a venture, for who could guarantee that the picture he has formed of the present psychological and spiritual plight of Europe is true to reality? Are we, as contemporaries of and participants in these cataclysmic events, at all capable of cool judgment and of seeing clearly amid the indescribable political and ideological chaos of present-day Europe? Or should we perhaps do better to narrow the field of psychotherapy and restrict our science to a modest specialists’ corner, remaining indifferent to the ruin of half the world? I fear that such a course, in spite of its commendable modesty, would ill accord with the nature of psychotherapy, which is after all the “treatment of the soul.” Indeed, the concept of psychotherapy, however one may choose to interpret it, carries with it very great pretensions: for the soul is the birth-place of all action and hence of everything that happens by the will of man. It would be difficult, if not impossible, to carve out an arbitrarily limited segment of the infinitely vast realm of the psyche and call that the secluded theatre of psychotherapy. Medicine, it is true, has found itself obliged to mark off a specific field, that of the neuroses and psychoses, and this is both convenient and feasible for the practical purpose of treatment. But the artificial restriction must be broken down immediately psychotherapy understands its problems not simply as those of a technique but as those of a science. Science *qua* science has no boundaries, and there is no speciality whatever that can boast of complete self-sufficiency. Any speciality is bound to spill over its borders and to encroach on adjoining territory if it is to lay serious claim to the status of a science. Even so highly specialized a technique as Freudian psychoanalysis was unable, at

the very outset, to avoid poaching on other, and sometimes exceedingly remote, scientific preserves. It is, in fact, impossible to treat the psyche, and human personality in general, sectionally. In all psychic disturbances it is becoming clear—perhaps even more so than in the case of physical illnesses—that the psyche is a whole in which everything hangs together. When the patient comes to us with a neurosis, he does not bring a part but the whole of his psyche and with it the fragment of world on which that psyche depends, and without which it can never be properly understood. Psychotherapy is therefore less able than any other specialized department of science to take refuge in the sanctuary of a speciality which has no further connection with the world at large. Try as we may to concentrate on the most personal of personal problems, our therapy nevertheless stands or falls with the question: What sort of world does our patient come from and to what sort of world has he to adapt himself? The world is a supra-personal fact to which an essentially personalistic psychology can never do justice. Such a psychology only penetrates to the personal element in man. But in so far as he is also a part of the world, he carries the world in himself, that is, something at once impersonal and supra-personal. It includes his entire physical and psychic basis, so far as this is given from the start. Undoubtedly the personalities of father and mother form the first and apparently the only world of man as an infant; and, if they continue to do so for too long, he is on the surest road to neurosis, because the great world he will have to enter as a whole person is no longer a world of fathers and mothers, but a supra-personal fact. The child first begins to wean itself from the childhood relation to father and mother through its relation to its brothers and sisters. The elder brother is no longer the true father and the elder sister no longer the true mother. Later, husband and wife are originally strangers to one another and come from different families with a different history and often a different social background. When children come, they complete the process by forcing the parents into the role of father and mother, which the parents, in accordance with their infantile attitude, formerly saw only in others, thereby trying to secure for themselves all the advantages of the childhood role. Every more or less normal life runs this enantiodromian course and compels a change of attitude from the extreme of the child to the other extreme of the parent. The change requires the recognition of objective facts and values which a child can dismiss from his mind. School, however, inexorably instils into him the idea of objective time, of duty and the fulfilment of duty, of outside authority, no matter whether he likes or loathes the school and his teacher. And with school and the relentless advance of time, one objective fact after another increasingly forces its way into his personal life, regardless of whether it is welcome or not and whether he has developed any special attitude towards it. Meanwhile it is made overpoweringly clear that any prolongation of the father-and-mother world beyond its allotted span must be paid for dearly. All attempts to carry the infant's personal world over into the greater world are doomed to failure; even the transference which occurs during the treatment of neurosis is at best only an intermediate stage, giving the patient a chance to shed all the fragments of egg-shell still adhering to him from his childhood days, and to withdraw the projection of the parental imagos from external reality. This operation is one of the most difficult tasks of modern psychotherapy. At one time it was optimistically assumed that the parental imagos could be more or less broken down and destroyed through analysis of their contents. But in reality that is not the case: although the parental imagos can be released from the state of projection and withdrawn from the external world, they continue, like everything else acquired in early childhood, to retain their original freshness. With the withdrawal of the projection they fall back into the individual psyche, from which indeed they mainly originated.[2]

[213] Before we go into the question of what happens when the parental imagos are no longer projected, let us turn to another question: Is this problem, which has been brought to light by modern psychotherapy, a new one in the sense that it was unknown to earlier ages which possessed no scientific psychology as we understand it? How did this problem present itself in the past?

[214] In so far as earlier ages had in fact no knowledge of psychotherapy in our sense of the word, we cannot possibly expect to find in history any formulations similar to our own. But since the transformation of child into parent has been going on everywhere from time immemorial and, with the increase of consciousness, was also experienced subjectively as

a difficult process, we must conjecture the existence of various general psychotherapeutic systems which enabled man to accomplish the difficult transition-stages. And we do find, even at the most primitive level, certain drastic measures at all those moments in life when psychic transitions have to be effected. The most important of these are the initiations at puberty and the rites pertaining to marriage, birth, and death. All these ceremonies, which in primitive cultures still free from foreign influence are observed with the utmost care and exactitude, are probably designed in the first place to avert the psychic injuries liable to occur at such times; but they are also intended to impart to the initiand the preparation and teaching needed for life. The existence and prosperity of a primitive tribe are absolutely bound up with the scrupulous and traditional performance of the ceremonies. Wherever these customs fall into disuse through the influence of the white man, authentic tribal life ceases; the tribe loses its soul and disintegrates. Opinion is very much divided about the influence of Christian missionaries in this respect; what I myself saw in Africa led me to take an extremely pessimistic view.

[215] On a higher and more civilized level the same work is performed by the great religions. There are the christening, confirmation, marriage, and funeral ceremonies which, as is well known, are much closer to their origins, more living and complete, in Catholic ritual than in Protestantism. Here too we see how the father-mother world of the child is superseded by a wealth of analogical symbols: a patriarchal order receives the adult into a new filial relationship through spiritual generation and rebirth. The pope as *pater patrum* and the *ecclesia mater* are the parents of a family that embraces the whole of Christendom, except such parts of it as protest. Had the parental imagos been destroyed in the course of development and thus been rendered ineffective, an order of this kind would have lost not only its *raison d’être* but the very possibility of its existence. As it is, however, a place is found for the ever-active parental imagos as well as for that ineradicable feeling of being a child, a feeling which finds meaning and shelter in the bosom of the Church. In addition, a number of other ecclesiastical institutions provide for the steady growth and constant renewal of the bond. Among them I would mention in particular the mass and the confessional. The

Communion is, in the proper sense of the word, the family table at which the members foregather and partake of the meal in the presence of God, following a sacred custom that goes far back into pre-Christian times.

[216] It is superfluous to describe these familiar things in greater detail. I mention them only to show that the treatment of the psyche in times gone by had in view the same fundamental facts of human life as modern psychotherapy. But how differently religion deals with the parental imagos! It does not dream of breaking them down or destroying them; on the contrary, it recognizes them as living realities which it would be neither possible nor profitable to eliminate. Religion lets them live on in changed and exalted form within the framework of a strictly traditional patriarchal order, which keeps not merely decades but whole centuries in living connection. Just as it nurtures and preserves the childhood psyche of the individual, so also it has conserved numerous and still living vestiges of the childhood psyche of humanity. In this way it guards against one of the greatest psychic dangers–loss of roots–which is a disaster not only for primitive tribes but for civilized man as well. The breakdown of a tradition, necessary as this may be at times, is always a loss and a danger; and it is a danger to the soul because the life of instinct —the most conservative element in man–always expresses itself in traditional usages. Age-old convictions and customs are deeply rooted in the instincts. If they get lost, the conscious mind becomes severed from the instincts and loses its roots, while the instincts, unable to express themselves, fall back into the unconscious and reinforce its energy, causing this in turn to overflow into the existing contents of consciousness. It is then that the rootless condition of consciousness becomes a real danger. This secret *vis a tergo* results in a hybris of the conscious mind which manifests itself in the form of exaggerated self-esteem or an inferiority complex. At all events a loss of balance ensues, and this is the most fruitful soil for psychic injury.

[217] If we look back over the thousand-odd years of our European civilization, we shall see that the Western ideal of the education and care of the soul has been, and for the most part still is, a patriarchal order based on the recognition of parental imagos. Thus in dealing with the individual, no matter how revolutionary his conscious attitude may be,

we have to reckon with a patriarchal or hierarchical orientation of the psyche which causes it instinctively to seek and cling to this order. Any attempt to render the parental imagos and the childhood psyche ineffective is therefore doomed to failure from the outset.

[218] At this point we come back to our earlier question of what happens when the parental imagos are withdrawn from projection. The detachment of these imagos from certain persons who carry the projection is undoubtedly possible and belongs to the stock in trade of psychotherapeutic success. On the other hand the problem becomes more difficult when there is a transference of the imagos to the doctor. In these cases the detachment can develop into a crucial drama. For what is to happen to the imagos if they are no longer attached to a human being? The pope as supreme father of Christendom holds his office from God; he is the servant of servants, and transference of the imagos to him is thus a transference to the Father in heaven and to Mother Church on earth. But how fares it with men and women who have been uprooted and torn out of their tradition? Professor Murray[3] of Harvard University has shown on the basis of extensive statistical material–thus confirming my own previously published experience–that the incidence of complexes is, on the average, highest among Jews; second come Protestants; and Catholics third. That a man's philosophy of life is directly connected with the well-being of the psyche can be seen from the fact that his mental attitude, his way of looking at things, is of enormous importance to him and his mental health–so much so that we could almost say that things are less what they are than how we see them. If we have a disagreeable view of a situation or thing, our pleasure in it is spoiled, and then it does in fact usually disagree with us. And, conversely, how many things become bearable and even acceptable if we can give up certain prejudices and change our point of view. Paracelsus, who was above all a physician of genius, emphasized that nobody could be a doctor who did not understand the art of "theorizing."[4] What he meant was that the doctor must induce, not only in himself but also in his patient, a way of looking at the illness which would enable the doctor to cure and the patient to recover, or at least to endure being ill. That is why he says "every illness is a purgatorial fire."[5] He consciously recognized and made full use of

the healing power of a man’s mental attitude. When, therefore, I am treating practising Catholics, and am faced with the transference problem, I can, by virtue of my office as a doctor, step aside and lead the problem over to the Church. But if I am treating a non-Catholic, that way out is debarred, and by virtue of my office as a doctor I cannot step aside, for there is as a rule nobody there, nothing towards which I could suitably lead the father-imago. I can, of course, get the patient to recognize with his reason that I am not the father. But by that very act I become the reasonable father and remain despite everything the father. Not only nature, but the patient too, abhors a vacuum. He has an instinctive horror of allowing the parental imagos and his childhood psyche to fall into nothingness, into a hopeless past that has no future. His instinct tells him that, for the sake of his own wholeness, these things must be kept alive in one form or another. He knows that a complete withdrawal of the projection will be followed by an apparently endless isolation within the ego, which is all the more burdensome because he has so little love for it. He found it unbearable enough before, and he is unlikely to bear it now simply out of sweet reasonableness. Therefore at this juncture the Catholic who has been freed from an excessively personal tie to his parents can return fairly easily to the mysteries of the Church, which he is now in a position to understand better and more deeply. There are also Protestants who can discover in one of the newer variants of Protestantism a meaning which appeals to them, and so regain a genuine religious attitude. All other cases—unless there is a violent and sometimes injurious solution—will, as the saying goes, “get stuck” in the transference relationship, thereby subjecting both themselves and the doctor to a severe trial of patience. Probably this cannot be avoided, for a sudden fall into the orphaned, parentless state may in certain cases—namely, where there is a tendency to psychosis—have dangerous consequences owing to the equally sudden activation of the unconscious which always accompanies it. Accordingly the projection can and should be withdrawn only step by step. The integration of the contents split off in the parental imagos has an activating effect on the unconscious, for these imagos are charged with all the energy they originally possessed in childhood, thanks to which they continued to exercise a fateful influence even on the adult. Their integration therefore means a considerable afflux of energy to the unconscious, which soon makes itself felt in the increasingly strong coloration of the conscious mind by unconscious contents. Isolation in pure ego-consciousness has the paradoxical consequence that there now appear in dreams and fantasies impersonal, collective contents which are the very material from which certain schizophrenic psychoses are constructed. For this reason the situation is not without its dangers, since the releasing of the ego from its ties with the projection—and of these the transference to the doctor plays the principal part—involves the risk that the ego, which was formerly dissolved in relationships to the personal environment, may now be dissolved in the contents of the collective unconscious. For, although the parents may be dead in the world of external reality, they and their imagos have passed over into the "other" world of the collective unconscious, where they continue to attract the same ego-dissolving projections as before.

[219] But at this point a healthful, compensatory operation comes into play which each time seems to me like a miracle. Struggling against that dangerous trend towards disintegration, there arises out of this same collective unconscious a counteraction, characterized by symbols which point unmistakably to a process of centring. This process creates nothing less than a new centre of personality, which the symbols show from the first to be superordinate to the ego and which later proves its superiority empirically. The centre cannot therefore be classed with the ego, but must be accorded a higher value. Nor can we continue to give it the name of "ego," for which reason I have called it the "self." To experience and realize this self is the ultimate aim of Indian yoga, and in considering the psychology of the self we would do well to have recourse to the treasures of Indian wisdom. In India, as with us, the experience of the self has nothing to do with intellectualism; it is a vital happening which brings about a fundamental transformation of personality. I have called the process that leads to this experience the "process of individuation." If I recommend the study of classical yoga, it is not because I am one of those who roll up their eyes in ecstasy when they hear such magic words as *dhyana* or *buddhi* or *mukti*, but because psychologically we can learn a great deal from yoga philosophy and turn it to practical account.

Furthermore, the material lies ready to hand, clearly formulated in the Eastern books and the translations made of them. Here again my reason is not that we have nothing equivalent in the West: I recommend yoga merely because the Western knowledge which is akin to it is more or less inaccessible except to specialists. It is esoteric, and it is distorted beyond recognition by being formulated as an arcane discipline and by all the rubbish that this draws in its wake. In alchemy there lies concealed a Western system of yoga meditation, but it was kept a carefully guarded secret from fear of heresy and its painful consequences. For the practising psychologist, however, alchemy has one inestimable advantage over Indian yoga—its ideas are expressed almost entirely in an extraordinarily rich symbolism, the very symbolism we still find in our patients today. The help which alchemy affords us in understanding the symbols of the individuation process is, in my opinion, of the utmost importance.[6]

[220] Alchemy describes what I call the "self" as *incorruptibile*, that is, an indissoluble substance, a One and Indivisible that cannot be reduced to anything else and is at the same time a Universal, to which a sixteenth-century alchemist even gave the name of *filius macrocosmi*.[7] Modern findings agree in principle with these formulations.

[221] I had to mention all these things in order to get to the problem of today. For if we perseveringly and consistently follow the way of natural development, we arrive at the experience of the self, and at the state of being simply what one is. This is expressed as an ethical demand by the motto of Paracelsus, the four-hundredth anniversary of whose birth we celebrated in the autumn of 1941: "Alterius non sit, qui suus esse potest" (That man no other man shall own,/Who to himself belongs alone)—a motto both characteristically Swiss and characteristically alchemical. But the way to this goal is toilsome and not for all to travel. "Est longissima via," say the alchemists. We are still only at the beginning of a development whose origins lie in late antiquity, and which throughout the Middle Ages led little more than a hole-and-corner existence, vegetating in obscurity and represented by solitary eccentrics who were called, not without reason, *tenebriones*. Nevertheless men like Albertus Magnus, Roger Bacon, and Paracelsus were among the fathers of modern science,

and their spirit did much to shake the authority of the "total" Church. Our modern psychology grew out of the spirit of natural science and, without realizing it, is carrying on the work begun by the alchemists. These men were convinced that the *donum artis* was given only to the few *electis*, and today our experience shows us only too plainly how arduous is the work with each patient and how few can attain the necessary knowledge and experience. Meanwhile the disintegration and weakening of that salutary institution, the Christian Church, goes on at an alarming rate, and the loss of any firm authority is gradually leading to an intellectual, political, and social anarchy which is repugnant to the soul of European man, accustomed as he is to a patriarchal order. The present attempts to achieve full individual consciousness and to mature the personality are, socially speaking, still so feeble that they carry no weight at all in relation to our historic needs. If our European social order is not to be shaken to its foundations, authority must be restored at all costs.

[222] This is probably one reason for the efforts now being made in Europe to replace the collectivity of the Church by the collectivity of the State. And just as the Church was once absolute in its determination to make theocracy a reality, so the State is now making an absolute bid for totalitarianism. The mystique of the spirit has not been replaced by a mystique either of nature or of the *lumen naturae*, as Paracelsus named it, but by the total incorporation of the individual in a political collective called the "State." This offers a way out of the dilemma, for the parental imagos can now be projected upon the State as the universal provider and the authority responsible for all thinking and willing. The ends of science are made to serve the social collective and are only valued for their piactical utility to the collective's ends. The natural course of psychological development is succeeded, not by a spiritual direction which spans the centuries and keeps cultural values alive, but by a political directorate which ministers to the power struggles of special groups and promises economic benefits to the masses. In this way European man's deep-seated longing for a patriarchal and hierarchical order finds an appropriate concrete expression which accords only too well with the herd instinct, but is fixed at such a low level as to be in every respect detrimental to culture.

[223] It is here that opinion is apt to be divided. In so far as psychotherapy claims to stand on a scientific basis and thus by the principle of free investigation, its declared aim is to educate people towards independence and moral freedom in accordance with the knowledge arrived at by unprejudiced scientific research. Whatever the conditions to which the individual wishes to adapt himself, he should always do so consciously and of his own free choice. But, in so far as political aims and the State are to claim precedence, psychotherapy would inevitably become the instrument of a particular political system, and it is to *its* aims that people would have to be educated and at the same time seduced from their own highest destiny. Against this conclusion it will undoubtedly be objected that man's ultimate destiny lies not in his existence as an individual but in the aspirations of human society, because without this the individual could not exist at all. This objection is a weighty one and cannot be lightly dismissed. It is an undoubted truth that the individual exists only by virtue of society and has always so existed. That is why among primitive tribes we find the custom of initiation into manhood, when, by means of a ritual death, the individual is detached from his family and indeed from his whole previous identity, and is reborn as a member of the tribe. Or we find early civilizations, such as the Egyptian and Babylonian, where all individuality is concentrated in the person of the king, while the ordinary person remains anonymous. Or again, we observe whole families in which for generations the individuality of the name has compensated for the nonentity of its bearers; or a long succession of Japanese artists who discard their own name and adopt the name of a master, simply adding after it a modest numeral. Nevertheless, it was the great and imperishable achievement of Christianity that, in contrast to these archaic systems which are all based on the original projection of psychic contents, it gave to each individual man the dignity of an immortal soul, whereas in earlier times this prerogative was reserved to the sole person of the king. It would lead me too far to discuss here just how much this Christian innovation represents an advance of human consciousness and of culture in general, by putting an end to the projection of the highest values of the individual soul upon the king or other dignitaries. The innate will to consciousness, to moral freedom and culture, proved stronger than the brute compulsion of

projections which keep the individual permanently imprisoned in the dark of unconsciousness and grind him down into nonentity. Certainly this advance laid a cross upon him—the torment of consciousness, of moral conflict, and the uncertainty of his own thoughts. This task is so immeasurably difficult that it can be accomplished, if at all, only by stages, century by century, and it must be paid for by endless suffering and toil in the struggle against all those powers which are incessantly at work persuading us to take the apparently easier road of unconsciousness. Those who go the way of unconsciousness imagine that the task can safely be left to "others" or, ultimately, to the anonymous State. But who are these "others," these obvious supermen who pretend to be able to do what everybody is only too ready to believe that he cannot do? They are men just like ourselves, who think and feel as we do, except that they are past masters in the art of "passing the buck." Exactly *who* is the State?—The agglomeration of all the nonentities composing it. Could it be personified, the result would be an individual, or rather a monster, intellectually and ethically far below the level of most of the individuals in it, since it represents mass psychology raised to the nth power. Therefore Christianity in its best days never subscribed to a belief in the State, but set before man a supramundane goal which should redeem him from the compulsive force of his projections upon this world, whose ruler is the spirit of darkness. And it gave him an immortal soul that he might have a fulcrum from which to lift the world off its hinges, showing him that his goal lies not in the mastery of this world but in the attainment of the Kingdom of God, whose foundations are in his own heart.

[224] If, then, man cannot exist without society, neither can he exist without oxygen, water, albumen, fat, and so forth. Like *these, society is one of the necessary conditions of his existence*. It would be ludicrous to maintain that man lives in order to breathe air. It is equally ludicrous to say that the individual exists for society. "Society" is nothing more than a term, a concept for the symbiosis of a group of human beings. A concept is not a carrier of life. The sole and natural carrier of life is the individual, and that is so throughout nature.[8] "Society" or "State" is an agglomeration of life-carriers and at the same time, as an organized form

of these, an important condition of life. It is therefore not quite true to say that the individual can exist only as a particle in society. At all events man can live very much longer without the State than without air.

[225] When the political aim predominates there can be no doubt that a secondary thing has been made the primary thing. Then the individual is cheated of his rightful destiny and two thousand years of Christian civilization are wiped out. Consciousness, instead of being widened by the withdrawal of projections, is narrowed, because society, a mere condition of human existence, is set up as a goal. Society is the greatest temptation to unconsciousness, for the mass infallibly swallows up the individual—who has no security in himself–and reduces him to a helpless particle. The totalitarian State could not tolerate for one moment the right of psychotherapy to help man fulfil his natural destiny. On the contrary, it would be bound to insist that psychotherapy should be nothing but a tool for the production of manpower useful to the State. In this way it would become a mere technique tied to a single aim, that of increasing social efficiency. The soul would forfeit all life of its own and become a function to be used as the State saw fit. The science of psychology would be degraded to a study of the ways and means to exploit the psychic apparatus. As to its therapeutic aim, the complete and successful incorporation of the patient into the State machine would be the criterion of cure. Since this aim can best be achieved by making the individual completely soulless—that is, as unconscious as possible—all methods designed to increase consciousness would at one stroke become obsolete, and the best thing would be to bring out of the lumber-rooms of the past all the methods that have ever been devised to prevent man from becoming conscious of his unconscious contents. Thus the art of psychotherapy would be driven into a complete regression.[9]

[226] Such, in broad outline, is the alternative facing psychotherapy at this present juncture. Future developments will decide whether Europe, which fancied it had escaped the Middle Ages, is to be plunged for a second time and for centuries into the darkness of an Inquisition. This will only happen if the totalitarian claims of the State are forcibly carried through and become a permanency. No intelligent person will deny that the organization of society, which we call the State, not only feels a lively

need to extend its authority but is compelled by circumstances to do so. If this comes about by free consent and the conscious choice of the public, the results will leave nothing to be desired. But if it comes about for the sake of convenience, in order to avoid tiresome decisions, or from lack of consciousness, then the individual runs the certain risk of being blotted out as a responsible human being. The State will then be no different from a prison or an ant-heap.

[227] Although the conscious achievement of individuality is consistent with man's natural destiny, it is nevertheless not his whole aim. It cannot possibly be the object of human education to create an anarchic conglomeration of individual existences. That would be too much like the unavowed ideal of extreme individualism, which is essentially no more than a morbid reaction against an equally futile collectivism. In contrast to all this, the natural process of individuation brings to birth a consciousness of human community precisely because it makes us aware of the unconscious, which unites and is common to all mankind. Individuation is an at-one-ment with oneself and at the same time with humanity, since oneself is a part of humanity. Once the individual is thus secured in himself, there is some guarantee that the organized accumulation of individuals in the State—even in one wielding greater authority—will result in the formation no longer of an anonymous mass but of a conscious community. The indispensable condition for this is conscious freedom of choice and individual decision. Without this freedom and self-determination there is no true community, and, it must be said, without such community even the free and self-secured individual cannot in the long run prosper.[10] Moreover, the common weal is best served by independent personalities. Whether man today possesses the maturity needed for such a decision is another question. On the other hand, solutions which violently forestall natural development and are forced on mankind are equally questionable. The facts of nature cannot in the long run be violated. Penetrating and seeping through everything like water, they will undermine any system that fails to take account of them, and sooner or later they will bring about its downfall. But an authority wise enough in its statesmanship to give sufficient free play to nature—of which spirit is a part—need fear no premature decline.

It is perhaps a humiliating sign of spiritual immaturity that European man needs, and wants, a large measure of authority. The fact has to be faced that countless millions in Europe—with the guilty complicity of reformers whose childishness is only equalled by their lack of tradition—have escaped from the authority of the Church and the *patria potestas* of kings and emperors only to fall helpless and senseless victims to any power that cares to assume authority. The immaturity of man is a fact that must enter into all our calculations.

[228] We in Switzerland are not living on a little planetoid revolving in empty space, but on the same earth as the rest of Europe. We are right in the middle of these problems, and if we are unconscious, we are just as likely to succumb to them as the other nations. The most dangerous thing would be for us to imagine that we are on a higher plane of consciousness than our neighbours. There is no question of that. While it would be an impropriety for a handful of psychologists and psychotherapists like ourselves to take our importance too seriously—or I might say, too pompously—I would nevertheless emphasize that just because we are psychologists it is our first task and duty to understand the psychic situation of our time and to see clearly the problems and challenges with which it faces us. Even if our voice is too weak to make itself heard above the tumult of political strife and fades away ineffectively, we may yet comfort ourselves with the saying of the Chinese Master: “When the enlightened man is alone and thinks rightly, it can be heard a thousand miles away.”

[229] All beginnings are small. Therefore we must not mind doing tedious but conscientious work on obscure individuals, even though the goal towards which we strive seems unattainably far off. But one goal we can attain, and that is to develop and bring to maturity individual personalities. And inasmuch as we are convinced that the individual is the carrier of life, we have served life’s purpose if one tree at least succeeds in bearing fruit, though a thousand others remain barren. Anyone who proposed to bring all growing things to the highest pitch of luxuriance would soon find the weeds—those hardiest of perennials—waving above his head. I therefore consider it the prime task of psychotherapy today to pursue with singleness of purpose the goal of

individual development. So doing, our efforts will follow nature’s own striving to bring life to the fullest possible fruition in each individual, for only in the individual can life fulfil its meaning—not in the bird that sits in a gilded cage.

IX

FUNDAMENTAL QUESTIONS OF PSYCHOTHERAPY[1]

[230] In the medical text-books of a few years back, under the general heading of “therapy,” at the end of a list of cures and pharmaceutical prescriptions, one might find a mysterious item called “psychotherapy.” What exactly one was to understand by this remained shrouded in eloquent obscurity. What did it mean? Was it hypnosis, suggestion, persuasion, catharsis, psychoanalysis, Adlerian education, autogenic training, or what? This list amply illustrates the vague multiplicity of opinions, views, theories, and methods that all pass under the name of “psychotherapy.”

[231] When a new and uninhabited continent is discovered, there are no landmarks, no names, no highways, and every pioneer who sets foot upon it comes back with a different story. Something of this kind seems to have happened when medical men plunged for the first time into the new continent named “psyche.” One of the first explorers to whom we are indebted for more or less intelligible reports is Paracelsus. His uncanny knowledge, which is at times not lacking in prophetic vision, was, however, expressed in a language that was informed by the spirit of the sixteenth century. It abounds not only in demonological and alchemical ideas, but in Paracelsian neologisms, whose florid exuberance compensated a secret feeling of inferiority quite in keeping with the self-assertiveness of their much maligned, and not unjustly misunderstood, creator. The scientific era, which began in earnest with the seventeenth century, cast out the pearls of Paracelsus’ medical wisdom along with the other lumber. Not until two centuries later did a new and altogether different kind of empiricism arise with Mesmer’s theory of animal magnetism, stemming partly from practical experiences which today we should attribute to suggestion, and partly from the old alchemical lore. Working along these lines, the physicians of the Romantic Age then

turned their attention to somnambulism, thus laving the foundations for the clinical discovery of hysteria. But almost another century had to pass before Charcot and his school could begin to consolidate ideas in this field. We have to thank Pierre Janet for a deeper and more exact knowledge of hysterical symptoms, and the two French physicians, Liébeanlt and Bernheim, later 10 be joined by August Forel in Switzerland, for a systematic investigation and description of the phenomena of suggestion. With the discovery by Breuer and Freud of the affective origins of psychogenic symptoms, our knowledge of their causation took a decisive step forward into the realm of psychology. The fact that the affectively toned memory images which are lost to consciousness lay at the root of the hysterical symptom immediately led to the postulate of an *unconscious* layer of psychic happenings. This layer proved to be, not “somatic,” as the academic psychology of those days was inclined to assume, but *psychic*, because it behaves exactly like any other psychic function from which consciousness is withdrawn, and which thus ceases to be associated with the ego. As Janet showed almost simultaneously with Freud, but independently of him, this holds true of hysterical symptoms generally. But whereas Janet supposed that the reason for the withdrawal of consciousness must lie in some specific weakness, Freud pointed out that the memory images which produce the symptoms are characterized by a disagreeable affective tone. Their disappearance from consciousness could thus easily be explained by *repression*. Freud therefore regarded the aetiological contents as “incompatible” with the tendencies of the conscious mind. This hypothesis was supported by the fact that repressed memories frequently arouse a moral censorship, and do so precisely on account of their traumatic or morally repellent nature.

[232] Freud extended the repression theory to the whole field of psychogenic neuroses with great practical success; indeed, he went on to use it as an explanation of culture as a whole. With this he found himself in the sphere of general psychology, which had long been entrusted to the philosophical faculty. Apart from a few technical terms and methodical points of view, psychology, as practised by the doctor, had not so far been able to borrow much from the philosophers, and so medical psychology,

on encountering an unconscious psyche right at the beginning of its career, literally stepped into a vacuum. The concept of the unconscious was, with a few praiseworthy exceptions, anathematized by academic psychology, so that only the phenomena of consciousness were left as a possible object for psychological research. The collision between the medical approach and the general psychology then prevailing was therefore considerable. On the other hand, Freud's discoveries were just as much of a challenge and a stumbling-block to the purely somatic views of the doctors. And so they have remained for the last fifty years. It needed the trend towards psychosomatic medicine that came over from America to put a fresher complexion on the picture. Even so, general psychology has still not been able to draw the necessary conclusions from the fact of the unconscious.

[233] Any advance into new territory is always attended by certain dangers, for the pioneer has to rely in all his undertakings upon the equipment he happens to take with him. This, in the present instance, is his training in somatic medicine, his general education, and his view of the world, which is based chiefly on subjective premises, partly temperamental, partly social. His medical premises enable him to size up correctly the somatic and biological aspects of the material he has to deal with; his general education makes it possible for him to form an approximate idea of the nature of the repressive factor; and finally, his view of the world helps him to put his special knowledge on a broader basis and to fit it into a larger whole. But when scientific research moves into a region hitherto undiscovered and therefore unknown, the pioneer must always bear in mind that another explorer, setting foot on the new continent at another place and with other equipment, may well sketch quite another picture.

[234] So it happened with Freud: his pupil Alfred Adler developed a view which shows neurosis in a very different light. It is no longer the sexual urge, or the pleasure principle, that dominates the picture, but the urge to power (self-assertion, "masculine protest," "the will to be on top"). As I have shown in a concrete instance,[2] both theories can be successfully applied to one and the same case; moreover it is a well-known psychological fact that the two urges keep the scales balanced, and that the one generally underlies the other. Adler remained as one-sided as

Freud, and both agree that not only the neurosis, but the man himself, can be explained from the shadow side, in terms of his moral inferiority.

[235] All this points to the existence of a personal equation, a subjective prejudice that was never submitted to criticism. The rigidity with which both men adhered to their position denotes, as always, the compensating of a secret uncertainty and an inner doubt. The facts as described by the two investigators are, if taken with a pinch of salt, right enough; but it is possible to interpret them in the one way as much as in the other, so that both are partially wrong, or rather, they are mutually complementary. The lesson to be drawn from this is that in practice one would do well to consider both points of view.

[236] The reason for this first dilemma of medical psychology presumably lies in the fact that the doctors found no cultivated ground under their feet, since ordinary psychology had nothing concrete to offer them. They were therefore thrown back on their own subjective prejudices as soon as they looked round for tools. For me, this resolved itself into the pressing need to examine the kind of attitudes which human beings in general adopt towards the object (no matter what this object may be). Accordingly, I have come to postulate a number of types which all depend on the respective predominance of one or the other orienting function of consciousness, and have devised a tentative scheme into which the various attitudes can be articulated. From this it would appear that there are no less than eight theoretically possible attitudes. If we add to these all the other more or less individual assumptions, it is evident that there is no end to the possible viewpoints, all of which have their justification, at least subjectively. In consequence, criticism of the psychological assumptions upon which a man’s theories are based becomes an imperative necessity. Unfortunately, however, this has still not been generally recognized, otherwise certain viewpoints could not be defended with such obstinacy and blindness. One can only understand why this should be so when one considers what the subjective prejudice signifies: it is as a rule a carefully constructed product into whose making has gone the whole experience of a lifetime. It is the individual psyche colliding with the environment. In the majority of cases, therefore, it is a subjective variant of a universal human experience, and for that very

reason careful self-criticism and detailed comparison are needed if we are to frame our judgments on a more universal basis. But the more we rely on the principles of consciousness in endeavouring to perform this essential task, the greater becomes the danger of our interpreting experience in those terms, and thus of doing violence to the facts by excessive theorizing. Our psychological experience is still too recent and too limited in scope to permit of general theories. The investigator needs a lot more facts which would throw light on the nature of the psyche before he can begin to think of universally valid propositions. For the present we must observe the rule that a psychological proposition can only lay claim to significance if the obverse of its meaning can also be accepted as true.

[237] Personal and theoretical prejudices are the most serious obstacles in the way of psychological judgment. They can, however, be eliminated with a little good will and insight. Freud himself accepted my suggestion that every doctor should submit to a training analysis before interesting himself in the unconscious of his patients for therapeutic purposes. All intelligent psychotherapists who recognize the need for conscious realization of unconscious aetiological factors agree with this view. Indeed it is sufficiently obvious, and has been confirmed over and over again by experience, that what the doctor fails to see in himself he either will not see at all, or will see grossly exaggerated, in his patient; further, he encourages those things to which he himself unconsciously inclines, and condemns everything that he abhors in himself. Just as one rightly expects the surgeon's hands to be free from infection, so one ought to insist with especial emphasis that the psychotherapist be prepared at all times to exercise adequate self-criticism, a necessity which is all the more incumbent upon him when he comes up against insuperable resistances in the patient which may possibly be justified. He should remember that the patient is there to be treated and not to verify a theory. For that matter, there is no single theory in the whole field of practical psychology that cannot on occasion prove basically wrong. In particular, the view that the patient's resistances are in no circumstances justified is completely fallacious. The resistance might very well prove that the treatment rests on false assumptions.

[238] I have dwelt on the theme of training analysis at some length because of late there have been renewed tendencies to build up the doctor's authority as such, and thus to inaugurate another era of *ex cathedra* psychotherapy, a project which differs in no way from the somewhat antiquated techniques of suggestion, whose inadequacy has long since become apparent. (This is not to say that suggestion therapy is never indicated.)

[239] The intelligent psychotherapist has known for years that any complicated treatment is an individual, *dialectical* process, in which the doctor, as a person, participates just as much as the patient. In any such discussion the question of whether the doctor has as much insight into his own psychic processes as he expects from his patient naturally counts for a very great deal, particularly in regard to the "rapport," or relationship of mutual confidence, on which the therapeutic success ultimately depends. The patient, that is to say, can win his own inner security only from the security of his relationship to the doctor as a human being. The doctor can put over his authority with fairly good results on people who are easily gulled. But for critical eyes it is apt to look a little too threadbare. This is also the reason why the priest, the predecessor of the doctor in his role of healer and psychologist, has in large measure forfeited his authority, at any rate with the educated public. Difficult cases, therefore, are a veritable ordeal for both patient and doctor. The latter should be prepared for this as far as possible by a thorough training analysis. It is far from being either an ideal or an absolutely certain means of dispelling illusions and projections, but at least it demonstrates the need for self-criticism and can reinforce the psychotherapist's aptitude in this direction. No analysis is capable of banishing all unconsciousness for ever. The analyst must go on learning endlessly, and never forget that each new case brings new problems to light and thus gives rise to unconscious assumptions that have never before been constellated. We could say, without too much exaggeration, that a good halt of every treatment that probes at all deeply consists in the doctor's examining himself, for only what he can put right in himself can he hope to put right in the patient. It is no loss, either, if he feels that the patient is hitting him, or even scoring off him: it is his own hurt that gives the measure of his

power to heal. This, and nothing else, is the meaning of the Greek myth of the wounded physician.[3]

[240] The problems with which we are concerned here do not occur in the field of "minor" psychotherapy, where the doctor can get along quite well with suggestion, good advice, or an apt explanation. But neuroses or psychotic borderline states in complicated and intelligent people frequently require what is called "major" psychotherapy, that is, the dialectical procedure. In order to conduct this with any prospect of success, all subjective and theoretical assumptions must be eliminated as far as practicable. One cannot treat a Mohammedan on the basis of Christian beliefs, nor a Parsee with Jewish orthodoxy, nor a Christian with the pagan philosophy of the ancient world, without introducing dangerous foreign bodies into his psychic organism. This sort of thing is constantly practised, and not always with bad results; but, for all that, it is an experiment whose legitimacy seems to me exceedingly doubtful. I think a conservative treatment is the more advisable. One should, if possible, not destroy any values that have not proved themselves definitely injurious. To replace a Christian view of the world by a materialistic one is, to my way of thinking, just as wrong as the attempt to argue with a convinced materialist. That is the task of the missionary, not of the doctor.

[241] Many psychotherapists, unlike me, hold the view that theoretical problems do not enter into the therapeutic process at all. The aetiological factors, they think, are all questions of purely personal psychology. But if we scrutinize these factors more closely, we find that they present quite a different picture. Take, for example, the sexual urge, which plays such an enormous role in Freudian theory. This urge, like every other urge, is not a personal acquisition, but is an objective and universal datum that has nothing whatever to do with our personal wishes, desires, opinions, and decisions. It is a completely impersonal force, and all we can do is to try to come to terms with it with the help of subjective and theoretical judgments. Of these latter, only the subjective premises (and then only a part of them) belong to the personal sphere; for the rest they are derived from the stream of tradition and from environmental influences, and only a very small fraction of them has been built up personally as a result of

conscious choice. Just as I find myself moulded by external and objective social influences, so also I am moulded by internal and unconscious forces, which I have summed up under the term "the subjective factor." The man with the extraverted attitude bases himself primarily on social relationships; the other, the introvert, primarily on the subjective factor. The former is largely unaware of his subjective determinacy and regards it as insignificant; as a matter of fact, he is frightened of it. The latter has little or no interest in social relationships; he prefers to ignore them, feeling them to be onerous, even terrifying. To the one, the world of relationships is the important thing; for him it represents normality, the goal of desire. The other is primarily concerned with the inner pattern of his life, with his own self-consistency.

[242] When we come to analyse the personality, we find that the extravert makes a niche for himself in the world of relationships at the cost of unconsciousness (of himself as a subject); while the introvert, in realizing his personality, commits the grossest mistakes in the social sphere and blunders about in the most absurd way. These two very typical attitudes are enough to show—quite apart from the types of physiological temperament described by Kretschmer—how little one can fit human beings and their neuroses into the strait jacket of a single theory.

[243] As a rule these subjective premises are quite unknown to the patient, and also, unfortunately, to the doctor, so that the latter is too often tempted to overlook the old adage *quod licet Jovi, non licet bovi*, or in other words, one man's meat is another man's poison, and in this way to unlock doors that were better shut, and vice versa. Medical theory is just as likely as the patient to become the victim of its own subjective premises, even if to a lesser degree, since it is at least the outcome of comparative work on a large number of cases and has therefore rejected any excessively individual variants. This, however, is only in the smallest degree true of the personal prejudices of its creator. Though the comparative work will do something to mitigate them, they will nevertheless give a certain colouring to his medical activities and will impose certain limits. Accordingly, one urge or the other, one idea or the other, will then impose itself as the limit and become a bogus principle which is the be-all and end-all of research. Within this framework

everything can be observed correctly and—according to the subjective premise—logically interpreted, as was undoubtedly the case with Freud and Adler; and yet in spite of this, or perhaps just because of it, very different views will result, in fact to all appearances they will be flatly irreconcilable. The reason obviously lies in the subjective premise, which assimilates what suits it and discards what does not.

[244] Such developments are by no means the exception in the history of science, they are the rule. Anyone who accuses modern medical psychology of not even being able to reach agreement on its own theories is completely forgetting that no science can retain its vitality without divergences of theory. Disagreements of this kind are, as always, incentives to a new and deeper questioning. So also in psychology. The Freud-Adler dilemma found its solution in the acceptance of divergent principles, each of which laid stress on one particular aspect of the total problem.

[245] Seen from this angle, there are numerous lines of research still waiting to be opened up. One of the most interesting, perhaps, is the problem of the *a priori* attitude-type and of the functions underlying it. This was the line followed by the Rorschach test, Gestalt psychology, and the various other attempts to classify type-differences. Another possibility, which seems to me equally important, is the investigation of the theoretical[4] factors that have proved to be of such cardinal importance when it comes to choosing and deciding. They have to be considered not only in the aetiology of neurosis, but in the evaluation of the analytical findings. Freud himself laid great emphasis on the function of the moral "censor" as one cause of repression, and he even felt obliged to hold up religion as one of the neuroticizing factors which lend support to infantile wish-fantasies. There are, in addition, theoretical assumptions that claim to play a decisive part in "sublimation"—value-categories that are supposed to help or hinder the work of fitting the tendencies revealed by the analysis of the unconscious into the life-plan of the patient. The very greatest significance attaches to the investigation of these so-called theoretical factors, not only in regard to the aetiology but—what is far more important—in regard to the therapy and necessary *reconstruction of the personality*, as Freud himself confirmed, even if only negatively, in

his later writings. A substantial part of these factors was termed by him the “super-ego,” which is the sum of all the collective beliefs and values consciously handed down by tradition. These, like the Torah for the orthodox Jew, constitute a solidly entrenched psychic system which is superordinate to the ego and the cause of numerous conflicts.

[246] Freud also observed that the unconscious occasionally produces images that can only be described as “archaic.” They are found more particularly in dreams and in waking fantasies. He, too, tried to interpret or amplify such symbols “historically,” as for example in his study of the dual mother motif in a dream of Leonardo da Vinci.[5]

[247] Now it is a well-known fact that the factors composing the “super-ego” correspond to the “collective representations” which Lévy-Bruhl posited as basic to the psychology of primitive man. The latter are general ideas and value-categories which have their origin in the primordial motifs of mythology, and they govern the psychic and social life of the primitive in much the same way as our lives are governed and moulded by the general beliefs, views, and ethical values in accordance with which we are brought up and by which we make our way in the world. They intervene almost automatically in all our acts of choice and decision, as well as being operative in the formation of concepts. With a little reflection, therefore, we can practically always tell why we do something and on what general assumptions our judgments and decisions are based. The false conclusions and wrong decisions of the neurotic have pathogenic effects because they are as a rule in conflict with these premises. Whoever can live with these premises without friction fits into our society as perfectly as the primitive, who takes his tribal teachings as an absolute rule of conduct.

[248] But when an individual, as a result perhaps of some anomaly in his personal disposition (no matter what this may be), ceases to conform to the *canon* of collective ideas, he will very likely find himself not only in conflict with society, but in disharmony with himself, since the super-ego represents another psychic system within him. In that case he will become neurotic: a dissociation of the personality supervenes, which, given the necessary psychopathic foundation, may lead to its complete

fragmentation, that is, to the schizoid personality and to schizophrenia. Such a case serves as a model for the *personal neurosis,* for which an explanation in personalistic terms is quite sufficient, as we know from experience that no further procedure is necessary for a cure except the demolition of the subject's false conclusions and wrong decisions. His wrong attitude having been corrected, the patient can then fit into society again. His illness was in fact nothing but the product of a certain "weakness," either congenital or acquired. In cases of this kind it would be a bad mistake to try to alter anything in the fundamental idea, the "collective representation." That would only thrust the patient still deeper into his conflict with society by countenancing his pathogenic weakness.

[249] Clinical observations seem to show that schizophrenics fall into two different groups: an asthenic type (hence the French term *psychasthénie*) and a spastic type, given to active conflict. And the same is true of neurotics. The first type is represented by the kind of neurosis which can be explained purely personalistically, as it is a form of maladjustment based on personal weakness. The second type is represented by individuals who *could* be adjusted without much difficulty, and who have also proved their aptitude for it. But for some reason or other they cannot or will not adjust themselves, and they do not understand why their own particular "adjustment" does not make normal life possible for them, when in their estimation such a life should be well within the bounds of possibility. The reason for their neurosis seems to lie in their having something above the average, an overplus for which there is no adequate outlet. We may then expect the patient to be consciously or—in most cases—unconsciously critical of the generally accepted views and ideas. Freud, too, seems to have come across similar experiences, otherwise he would hardly have felt impelled to attack religion from the standpoint of the medical psychologist, as being the cornerstone of a man's fundamental beliefs. Seen in the light of medical experience, however, this attempt was, in a sense, thoroughly consistent with its own premises, although one can hold a very different view on the manner in which it was conducted; for not only is religion not the enemy of the sick, it is actually a system of psychic healing, as the use of the Christian term

"cure of souls" makes clear, and as is also evident from the Old Testament.[6]

[250] It is principally the neuroses of the second type that confront the doctor with problems of this kind. There are in addition not a few patients who, although they have no clinically recognizable neurosis, come to consult the doctor on account of psychic conflicts and various other difficulties in their lives, laying before him problems whose answer inevitably involves a discussion of fundamental questions. Such people often know very well—what the neurotic seldom or never knows—that their conflicts have to do with the fundamental problem of their own attitude, and that this is bound up with certain principles or general ideas, in a word, with their religious, ethical, or philosophical beliefs. It is precisely because of such cases that psychotherapy has to spread far beyond the confines of somatic medicine and psychiatry into regions that were formerly the province of priests and philosophers. From the degree to which priests and philosophers no longer discharge any duties in this respect or their competence to do so has been denied by the public, we can see what an enormous gap the psychotherapist is sometimes called upon to fill, and how remote religion on the one hand and philosophy on the other have become from the actualities of life. The parson is blamed because one always knows in advance what he is going to say; the philosopher, because he never says anything of the slightest practical value. And the odd thing is that both of them—with few and ever fewer exceptions—are distinctly unsympathetic towards psychology.

[251] The positive meaning of the religious factor in a man's philosophical outlook will not, of course, prevent certain views and interpretations from losing their force and becoming obsolete, as a result of changes in the times, in the social conditions, and in the development of human consciousness. The old mythologems upon which all religion is ultimately based are, as we now see them, the expression of inner psychic events and experiences; and, by means of a ritualistic "anamnesis," they enable the conscious mind to preserve its link with the unconscious, which continues to send out or "ecphorate"[7] the primordial images just as it did in the remote past. These images give adequate expression to the unconscious, and its instinctive movements can in that way be

transmitted to the conscious mind without friction, so that the conscious mind never loses touch with its instinctive roots. If, however, certain of these images become antiquated, if, that is to say, they lose all intelligible connection with our contemporary consciousness, then our conscious acts of choice and decision are sundered from their instinctive roots, and a partial disorientation results, because our judgment then lacks any feeling of definiteness and certitude, and there is no emotional driving-force behind decision. The collective representations that connect primitive man with the life of his ancestors or with the founders of his tribe form the bridge to the unconscious for civilized man also, who, if he is a believer, will see it as the world of divine presences. Today these bridges are in a state of partial collapse, and the doctor is in no position to hold those who are worst hit responsible for the disaster. He knows that it is due far more to a shifting of the whole psychic situation over many centuries, such as has happened more than once in human history. In the face of such transformations the individual is powerless.

[252] The doctor can only look on and try to understand the attempts at restitution and cure which nature herself is making. Experience has long shown that between conscious and unconscious there exists a compensatory relationship, and that the unconscious always tries to make whole the conscious part of the psyche by adding to it the parts that are missing, and so prevent a dangerous loss of balance. In our own case, as might be expected, the unconscious produces compensating symbols which are meant to replace the broken bridges, but which can only do so with the active co-operation of consciousness. In other words, these symbols must, if they are to be effective, be “understood” by the conscious mind; they must be assimilated and integrated. A dream that is not understood remains a mere occurrence; understood, it becomes a living experience.

[253] I therefore consider it my main task to examine the manifestations of the unconscious in order to learn its language. But since, on the one hand, the theoretical assumptions we have spoken of are of eminently historical interest, and, on the other hand, the symbols produced by the unconscious derive from archaic modes of psychic functioning, one must, in carrying out these investigations, have at one’s command a vast

amount of historical material; and, secondly, one must bring together and collate an equally large amount of empirical material based on direct observation.

[254] The practical need for a deeper understanding of the products of the unconscious is sufficiently obvious. In pursuit of this, I am only going further along the path taken by Freud, though I certainly try to avoid having any preconceived metaphysical opinions. I try rather to keep to first-hand experience, and to leave metaphysical beliefs, either for or against, to look after themselves. I do not imagine for a moment that I can stand above or beyond the psyche, so that it would be possible to judge it, as it were, from some transcendental Archimedean point "outside." I am fully aware that I am entrapped in the psyche and that I cannot do anything except describe the experiences that there befall me. When, for instance, one examines the world of fairytales, one can hardly avoid the impression that one is meeting certain figures again and again, albeit in altered guise. Such comparisons lead on to what the student of folklore calls the investigation of motifs. The psychologist of the unconscious proceeds no differently in regard to the psychic figures which appear in dreams, fantasies, visions, and manic ideas, as in legends, fairytales, myth, and religion. Over the whole of this psychic realm there reign certain motifs, certain typical figures which we can follow far back into history, and even into prehistory, and which may therefore legitimately be described as "archetypes."[8] They seem to me to be built into the very structure of man's unconscious, for in no other way can I explain why it is that they occur universally and in identical form, whether the redeemer-figure be a fish, a hare, a lamb, a snake, or a human being. It is the same redeemer-figure in a variety of accidental disguises. From numerous experiences of this kind I have come to the conclusion that the most individual thing about man is surely his consciousness, but that his shadow, by which I mean the uppermost layer of his unconscious, is far less individualized, the reason being that a man is distinguished from his fellows more by his virtues than by his negative qualities. The unconscious, however, in its principal and most overpowering manifestations, can only be regarded as a collective phenomenon which is everywhere identical, and, because it never seems

to be at variance with itself, it may well possess a marvellous unity and self-consistency, the nature of which is at present shrouded in impenetrable darkness. Another fact to be considered here is the existence today of parapsychology, whose proper subject is manifestations that are directly connected with the unconscious. The most important of these are the ESP[9] phenomena, which medical psychology should on no account ignore. If these phenomena prove anything at all, it is the fact of a certain psychic relativity of space and time, which throws a significant light on the unity of the collective unconscious. For the present, at any rate, only two groups of facts have been established with any certainty: firstly, the congruence of individual symbols and mythologems; and secondly, the phenomenon of extra-sensory perception. The interpretation of these phenomena is reserved for the future.

II

SPECIFIC PROBLEMS OF PSYCHOTHERAPY

I

THE THERAPEUTIC VALUE OF ABREACTION[1]

[255] In his discussion of William Brown's paper, "The Revival of Emotional Memories and Its Therapeutic Value," William McDougall, writing in the *British Journal of Psychology*,[2] gave expression to some important considerations which I would like to underline here. The neuroses resulting from the Great War have, with their essentially traumatic aetiology, revived the whole question of the trauma theory of neurosis. During the years of peace this theory had rightly been kept in the background of scientific discussion, since its conception of neurotic aetiology is far from adequate.

[256] The originators of the theory were Breuer and Freud. Freud went on to a deeper investigation of the neuroses and soon adopted a view that took more account of their real origins. In by far the greater number of ordinary cases there is no question of a traumatic aetiology.

[257] But, in order to create the impression that the neurosis is caused by some trauma or other, unimportant and secondary occurrences must be given an artificial prominence for the sake of the theory. These traumata, when they are not mere products of medical fantasy, or else the result of the patient's own compliancy, are secondary phenomena, the outcome of an attitude that is already neurotic. The neurosis is as a rule a pathological, one-sided development of the personality, the imperceptible beginnings of which can be traced back almost indefinitely into the earliest years of childhood. Only a very arbitrary judgment can say where the neurosis actually begins.

[258] If we were to relegate the determining cause as far back as the patient's prenatal life, thus involving the physical and psychic disposition of the parents at the time of conception and pregnancy—a view that seems not at all improbable in certain cases—such an attitude would be

more justifiable than the arbitrary selection of a definite point of neurotic origin in the individual life of the patient.

[259] Clearly, in dealing with this question, one should never be influenced too much by the surface appearance of the symptoms, even when both the patient and his family synchronize the first manifestation of these with the onset of the neurosis. A more thorough investigation will almost invariably show that some morbid tendency existed long before the appearance of clinical symptoms.

[260] These obvious facts, long familiar to every specialist, pushed the trauma theory into the background until, as a result of the war, there was a regular spate of traumatic neuroses.

[261] Now, if we set aside the numerous cases of war neurosis where a trauma—a violent shock—impinged upon an established neurotic history, there still remain not a few cases where no neurotic disposition can be established, or where it is so insignificant that the neurosis could hardly have arisen without a trauma. Here the trauma is more than an agent of release: it is causative in the sense of a *causa efficiens*, especially when we include, as an essential factor, the unique psychic atmosphere of the battlefield.

[262] These cases present us with a new therapeutic problem which seems to justify a return to the original Breuer-Freud method and its underlying theory; for the trauma is either a single, definite, violent impact, or a complex of ideas and emotions which may be likened to a psychic wound. Everything that touches this complex, however slightly, excites a vehement reaction, a regular emotional explosion. Hence one could easily represent the trauma as a complex with a high emotional charge, and because this enormously effective charge seems at first sight to be the pathological cause of the disturbance, one can accordingly postulate a therapy whose aim is the complete release of this charge. Such a view is both simple and logical, and it is in apparent agreement with the fact that abreaction—i.e., the dramatic rehearsal of the traumatic moment, its emotional recapitulation in the waking or in the hypnotic state–often has a beneficial therapeutic effect. We all know that a man feels a compelling need to recount a vivid experience again and again until it has lost its

affective value. As the proverb says, “What filleth the heart goeth out by the mouth.” The unbosoming gradually depotentiates the affectivity of the traumatic experience until it no longer has a disturbing influence.

[263] This conception, apparently so clear and simple, is unfortunately—as McDougall rightly objects—no more adequate than many another equally simple and therefore delusive explanation. Views of this kind have to be fiercely and fanatically defended as though they were dogmas, because they cannot hold their own in the face of experience. McDougall is also right to point out that in quite a large number of cases abreaction is not only useless but actually harmful.

[264] In reply, it is possible to take up the attitude of an injured theorist and say that the abreactive method never claimed to be a panacea, and that refractory cases are to be met with in every method.

[265] But, I would rejoin, it is precisely here, in a careful study of the refractory cases, that we gain the most illuminating insight into the method or theory in question, for they disclose far more clearly than the successes just where the theory is weak. Naturally this does not disprove the efficacy of the method or its justification, but it does at least lead to a possible improvement of the theory and, indirectly, of the method.

[266] McDougall, therefore, has laid his finger on the right spot when he argues that the essential factor is the dissociation of the psyche and not the existence of a highly charged affect and, consequently, that the main therapeutic problem is not abreaction but how to integrate the dissociation. This argument advances our discussion and entirely agrees with our experience that a traumatic complex brings about dissociation of the psyche. The complex is not under the control of the will and for this reason it possesses the quality of psychic autonomy.

[267] Its autonomy consists in its power to manifest itself independently of the will and even in direct opposition to conscious tendencies: it forces itself tyrannically upon the conscious mind. The explosion of affect is a complete invasion of the individual, it pounces upon him like an enemy or a wild animal. I have frequently observed that the typical traumatic affect is represented in dreams as a wild and dangerous animal—a

striking illustration of its autonomous nature when split off from consciousness.

[268] Considered from this angle, abreaction appears in an essentially different light: as an attempt to reintegrate the autonomous complex, to incorporate it gradually into the conscious mind as an accepted content, by living the traumatic situation over again, once or repeatedly.

[269] But I rather question whether the thing is as simple as that, or whether there may not be other factors essential to the process. For it must be emphasized that mere rehearsal of the experience does not itself possess a curative effect: the experience must be rehearsed in the presence of the doctor.

[270] If the curative effect depended solely upon the rehearsal of experience, abreaction could be performed by the patient alone, as an isolated exercise, and there would be no need of any human object upon whom to discharge the affect. But the intervention of the doctor is absolutely necessary. One can easily see what it means to the patient when he can confide his experience to an understanding and sympathetic doctor. His conscious mind finds in the doctor a moral support against the unmanageable affect of his traumatic complex. No longer does he stand alone in his battle with these elemental powers, but some one whom he trusts reaches out a hand, lending him moral strength to combat the tyranny of uncontrolled emotion. In this way the integrative powers of his conscious mind are reinforced until he is able once more to bring the rebellious affect under control. This influence on the part of the doctor, which is absolutely essential, may, if you like, be called suggestion.

[271] For myself, I would rather call it his human interest and personal devotion. These are the property of no method, nor can they ever become one; they are moral qualities which are of the greatest importance in all methods of psychotherapy, and not in the case of abreaction alone. The rehearsal of the traumatic moment is able to reintegrate the neurotic dissociation only when the conscious personality of the patient is so far reinforced by his relationship to the doctor that he can consciously bring the autonomous complex under the control of his will.

[272] Only under these conditions has abreaction a curative value. But this does not depend solely on the discharge of affective tension; it depends, as McDougall shows, far more on whether or not the dissociation is successfully resolved. Hence the cases where abreaction has a negative result appear in a different light.

[273] In the absence of the conditions just mentioned, abreaction by itself is not sufficient to resolve the dissociation. If the rehearsal of the trauma fails to reintegrate the autonomous complex, then the relationship to the doctor can so raise the level of the patient’s consciousness as to enable him to overcome the complex and assimilate it. But it may easily happen that the patient has a particularly obstinate resistance to the doctor, or that the doctor does not have the right kind of attitude to the patient. In either case the abreactive method breaks down.

[274] It stands to reason that when dealing with neuroses which are traumatically determined only to a minor degree, the cathartic method of abreaction will meet with poor success. It has nothing to do with the nature of the neurosis, and its rigid application is quite ludicrous here. Even when a partial success is obtained, it can have no more significance than the success of any other method which admittedly had nothing to do with the nature of the neurosis.

[275] *Success* in these cases is due to suggestion; it is usually of very limited duration and clearly a matter of chance. The prime cause is always the transference to the doctor, and this is established without too much difficulty provided that the doctor evinces an earnest belief in his method. Precisely because it has as little to do with the nature of neurosis as, shall we say, hypnosis and other such cures, the cathartic method has, with few exceptions, long been abandoned in favour of analysis.

[276] Now it happens that the analytical method is most unassailable just where the cathartic method is most shaky: that is, in the relationship between doctor and patient. It matters little that, even today, the view prevails in many quarters that analysis consists mainly in “digging up” the earliest childhood complex in order to pluck out the evil by the root. This is merely the aftermath of the old trauma theory. Only in so far as they hamper the patient’s adaptation to the present have these historical

contents any real significance. The painstaking pursuit of all the ramifications of infantile fantasy is relatively unimportant in itself; the therapeutic effect comes from the doctor’s efforts to enter into the psyche of his patient, thus establishing a psychologically adapted relationship. For the patient is suffering precisely from the absence of such a relationship. Freud himself has long recognized that the transference is the alpha and omega of psychoanalysis. The transference is the patient’s attempt to get into psychological rapport with the doctor. He needs this relationship if he is to overcome the dissociation. The feebler the rapport, i.e., the less the doctor and patient understand one another, the more intensely will the transference be fostered and the more sexual will be its form.

[277] To attain the goal of adaptation is of such vital importance to the patient that sexuality intervenes as a function of compensation. Its aim is to consolidate a relationship that cannot ordinarily be achieved through mutual understanding. In these circumstances the transference can well become the most powerful obstacle to the success of the treatment. It is not surprising that violent sexual transferences are especially frequent when the analyst concentrates too much on the sexual aspect, for then all other roads to understanding are barred. An exclusively sexual interpretation of dreams and fantasies is a shocking violation of the patient’s psychological material: infantile-sexual fantasy is by no means the whole story, since the material also contains a creative element, the purpose of which is to shape a way out of the neurosis. This natural means of escape is now blocked; the doctor is the only certain refuge in a wilderness of sexual fantasies, and the patient has no alternative but to cling to him with a convulsive erotic transference, unless he prefers to break off the relationship in hatred.

[278] In either case the result is spiritual desolation. This is the more regrettable since, obviously, psychoanalysts do not in the least desire such a melancholy result; yet they often bring it about through their blind allegiance to the dogma of sexuality.

[279] Intellectually, of course, the sexual interpretation is extremely simple; it concerns itself at most with a handful of elementary facts which recur

in numberless variations. One always knows in advance where the matter will end. *Inter faeces et urinam nascimur* remains an eternal truth, but it is a sterile, a monotonous, and above all an unsavoury truth. There is absolutely no point in everlastingly reducing all the finest strivings of the soul back to the womb. It is a gross technical blunder because, instead of promoting, it destroys psychological understanding. More than anything else neurotic patients need that psychological rapport; in their dissociated state it helps them to adjust themselves to the doctor's psyche. Nor is it by any means so simple to establish this kind of human relationship; it can only be built up with great pains and scrupulous attention. The continual reduction of all projections to their origins—and the transference is made up of projections—may be of considerable historical and scientific interest, but it never produces an adapted attitude to life; for it constantly destroys the patient's every attempt to build up a normal human relationship by resolving it back into its elements.

[280] If, in spite of this, the patient does succeed in adapting himself to life, it will have been at the cost of many moral, intellectual, and aesthetic values whose loss to a man's character is a matter for regret. Quite apart from this major loss, there is the danger of perpetually brooding on the past, of looking back wistfully to things that cannot be remedied now: the morbid tendency, very common among neurotics, always to seek the cause of their inferiority in the dim bygone, in their upbringing, the character of their parents, and so forth.

[281] This minute scrutiny of minor determinants will affect their present inferiority as little as the existing social conditions would be ameliorated by an equally painstaking investigation of the causes of the Great War. The real issue is the moral achievement of the whole personality.

[282] To assert, as a general principle, that a reductive analysis is unnecessary would of course be short-sighted and no more intelligent than to deny the value of all research into the causes of war. The doctor must probe as deeply as possible into the origins of the neurosis in order to lay the foundations of a subsequent synthesis. As a result of reductive analysis, the patient is deprived of his faulty adaptation and led back to his beginnings. The psyche naturally seeks to make good this loss by

intensifying its hold upon some human object–generally the doctor, but occasionally some other person, like the patient's husband or a friend who acts as a counterpole to the doctor. This may effectively balance a one-sided transference, but it may also turn out to be a troublesome obstacle to the progress of the work. The intensified tie to the doctor is a compensation for the patient's faulty attitude to reality. This tie is what we mean by "transference."

[283] The transference phenomenon is an inevitable feature of every thorough analysis, for it is imperative that the doctor should get into the closest possible touch with the patient's line of psychological development. One could say that in the same measure as the doctor assimilates the intimate psychic contents of the patient into himself, he is in turn assimilated as a figure into the patient's psyche. I say "as a figure," because I mean that the patient sees him not as he really is, but as one of those persons who figured so significantly in his previous history. He becomes associated with those memory images in the patient's psyche because, like them, he makes the patient divulge all his intimate secrets. It is as though he were charged with the power of those memory images.

[284] The transference therefore consists in a number of projections which act as a substitute for a real psychological relationship. They create an apparent relationship and this is very important, since it comes at a time when the patient's habitual failure to adapt has been artificially intensified by his analytical removal into the past. Hence a sudden severance of the transference is always attended by extremely unpleasant and even dangerous consequences, because it maroons the patient in an impossibly unrelated situation.

[285] Even if these projections are analysed back to their origins—and all projections can be dissolved and disposed of in this way—the patient's claim to human relationship still remains and should be conceded, for without a relationship of some kind he falls into a void.

[286] Somehow he must relate himself to an object existing in the immediate present if he is to meet the demands of adaptation with any degree of adequacy. Irrespective of the reductive analysis, he will turn to the doctor not as an object of sexual desire, but as an object of purely

human relationship in which each individual is guaranteed his proper place. Naturally this is impossible until all the projections have been consciously recognized; consequently they must be subjected to a reductive analysis before all else, provided of course that the legitimacy and importance of the underlying claim to personal relationship is constantly borne in mind.

[287] Once the projections are recognized as such, the particular form of rapport known as the transference is at an end, and the problem of individual relationship begins. Every student who has perused the literature and amused himself with interpreting dreams and unearthing complexes in himself and others can easily get as far as this, but beyond it no one has the right to go except the doctor who has himself undergone a thorough analysis, or can bring such passion for truth to the work that he can analyse himself through his patient. The doctor who has no wish for the one and cannot achieve the other should never touch analysis; he will be found wanting, cling as he may to his petty conceit of authority.

[288] In the last resort his whole work will be intellectual bluff—for how can he help his patient to conquer his morbid inferiority when he himself is so manifestly inferior? How can the patient learn to abandon his neurotic subterfuges when he sees the doctor playing hide-and-seek with his own personality, as though unable, for fear of being thought inferior, to drop the professional mask of authority, competence, superior knowledge, etc.?

[289] The touchstone of every analysis that has not stopped short at partial success, or come to a standstill with no success at all, is always this person-to-person relationship, a psychological situation where the patient confronts the doctor upon equal terms, and with the same ruthless criticism that he must inevitably learn from the doctor in the course of his treatment.

[290] This kind of personal relationship is a freely negotiated bond or contract as opposed to the slavish and humanly degrading bondage of the transference. For the patient it is like a bridge; along it, he can make the first steps towards a worthwhile existence. He discovers that his own unique personality has value, that he has been accepted for what he is,

and that he has it in him to adapt himself to the demands of life. But this discovery will never be made while the doctor continues to hide behind a method, and allows himself to carp and criticize without question. Whatever method he then adopts, it will be little different from suggestion, and the results will match the method. In place of this, the patient must have the right to the freest criticism, and a true sense of human equality.

[291] I think I have said enough to indicate that, in my view, analysis makes far higher demands on the mental and moral stature of the doctor than the mere application of a routine technique, and also that his therapeutic influence lies primarily in this more personal direction.

[292] But if the reader should conclude that little or nothing lay in the method, I would regard that as a total misapprehension of my meaning. Mere personal sympathy can never give the patient that objective understanding of his neurosis which makes him independent of the doctor and sets up a counterinfluence to the transference.

[293] For the objective understanding of his malady, and for the creation of a personal relationship, science is needed—not a purely medical knowledge that embraces only a limited field, but a wide knowledge of every aspect of the human psyche. The treatment must do more than destroy the old morbid attitude; it must build up a new attitude that is sound and healthy. This requires a fundamental change of vision. Not only must the patient be able to see the cause and origin of his neurosis, he must also see the legitimate psychological goal towards which he is striving. We cannot simply extract his morbidity like a foreign body, lest something essential be removed along with it, something meant for life. Our task is not to weed it out, but to cultivate and transform this growing thing until it can play its part in the totality of the psyche.

II

THE PRACTICAL USE OF DREAM-ANALYSIS[1]

[294] The use of dream-analysis in psychotherapy is still a much debated question. Many practitioners find it indispensable in the treatment of neuroses, and consider that the dream is a function whose psychic importance is equal to that of the conscious mind itself. Others, on the contrary, dispute the value of dream-analysis and regard dreams as a negligible by-product of the psyche. Obviously, if a person holds the view that the unconscious plays a decisive part in the aetiology of neuroses, he will attribute a high practical importance to dreams as direct expressions of the unconscious. Equally obviously, if he denies the unconscious or at least thinks it aetiologically insignificant, he will minimize the importance of dream-analysis. It might be considered regrettable that in this year of grace 1931, more than half a century after Carus formulated the concept of the unconscious, more than a century after Kant spoke of the “illimitable field of obscure ideas,” and nearly two hundred years after Leibniz postulated an unconscious psychic activity, not to mention the achievements of Janet, Flournoy, Freud, and many more—that after all this, the actuality of the unconscious should still be a matter for controversy. But, since it is my intention to deal exclusively with practical questions, I will not advance in this place an apology for the unconscious, although our special problem of dream-analysis stands or falls with such an hypothesis. Without it, the dream is a mere freak of nature, a meaningless conglomeration of fragments left over from the day. Were that really so, there would be no excuse for the present discussion. We cannot treat our theme at all unless we recognize the unconscious, for the avowed aim of dream-analysis is not only to exercise our wits, but to uncover and realize those hitherto unconscious contents which are considered to be of importance in the elucidation or

treatment of a neurosis. Anyone who finds this hypothesis unacceptable must simply rule out the question of the applicability of dream-analysis.

[295] But since, according to our hypothesis, the unconscious possesses an aetiological significance, and since dreams are the direct expression of unconscious psychic activity, the attempt to analyse and interpret dreams is theoretically justified from a scientific standpoint. If successful, we may expect this attempt to give us scientific insight into the structure of psychic causality, quite apart from any therapeutic results that may be gained. The practitioner, however, tends to consider scientific discoveries as, at most, a gratifying by-product of his therapeutic work, so he is hardly likely to take the bare possibility of theoretical insight into the aetiological background as a sufficient reason for, much less an indication of, the practical use of dream-analysis. He may believe, of course, that the explanatory insight so gained is of therapeutic value, in which case he will elevate dream-analysis to a professional duty. It is well known that the Freudian school is of the firm opinion that very valuable therapeutic results are achieved by throwing light upon the unconscious causal factors—that is, by explaining them to the patient and thus making him fully conscious of the sources of his trouble.

[296] Assuming for the moment that this expectation is justified by the facts, then the only question that remains is whether dream-analysis can or cannot be used, alone or in conjunction with other methods, to discover the unconscious aetiology. The Freudian answer to this question is, I may assume, common knowledge. I can confirm this answer inasmuch as dreams, particularly the initial dreams which appear at the very outset of the treatment, often bring to light the essential aetiological factor in the most unmistakable way. The following example may serve as an illustration:

[297] I was consulted by a man who held a prominent position in the world. He was afflicted with a sense of anxiety and insecurity, and complained of dizziness sometimes resulting in nausea, heaviness in the head, and constriction of breath—a state that might easily be confused with mountain sickness. He had had an extraordinarily successful career, and had risen, by dint of ambition, industry, and native talent, from his

humble origins as the son of a poor peasant. Step by step he had climbed, attaining at last a leading position which held every prospect of further social advancement. He had now in fact reached the spring-board from which he could have commenced his flight into the empyrean, had not his neurosis suddenly intervened. At this point in his story the patient could not refrain from that familiar exclamation which begins with the stereotyped words: "And just now, when.…" The fact that he had all the symptoms of mountain sickness seemed highly appropriate as a drastic illustration of his peculiar impasse. He had also brought to the consultation two dreams from the preceding night. The first dream was as follows: *"I am back again in the small village where I was born. Some peasant lads who went to school with me are standing together in the street. I walk past, pretending not to know them. Then I hear one of them say, pointing at me: 'He doesn't often come back to our village.'"*

[298] It requires no feat of interpretation to see in this dream a reference to the humble beginnings of the dreamer's career and to understand what this reference means. The dream says quite clearly: "You forgot how far down you began."

[299] Here is the second dream: *"I am in a great hurry because I want to go on a journey. I keep on looking for things to pack, but can find nothing. Time flies, and the train will soon be leaving. Having finally succeeded in getting all my things together, I hurry along the street, only to discover that I have forgotten a brief-case containing important papers. I dash back all out of breath, find it at last, then race to the station, but I make hardly any headway. With a final effort I rush on to the platform only to see the train just steaming out of the station yard. It is very long, and it runs in a curious S-shaped curve, and it occurs to me that if the engine-driver does not look out, and puts on steam when he comes into the straight, the rear coaches will still be on the curve and will be thrown off the rails by the gathering speed. And this is just what happens: the engine-driver puts on steam, I try to cry out, the rear coaches give a frightful lurch and are thrown off the rails. There is a terrible catastrophe. I wake up in terror."*

[300] Here again no effort is needed to understand the message of the dream. It describes the patient’s frantic haste to advance himself still further. But since the engine-driver in front steams relentlessly ahead, the neurosis happens at the back: the coaches rock and the train is derailed.

[301] It is obvious that, at the present phase of his life, the patient has reached the highest point of his career; the strain of the long ascent from his lowly origin has exhausted his strength. He should have rested content with his achievements, but instead of that his ambition drives him on and on, and up and up into an atmosphere that is too thin for him and to which he is not accustomed. Therefore his neurosis comes upon him as a warning.

[302] Circumstances prevented me from treating the patient further, nor did my view of the case satisfy him. The upshot was that the fate depicted in the dream ran its course. He tried to exploit the professional openings that tempted his ambition, and ran so violently off the rails that the catastrophe was realized in actual life.

[303] Thus, what could only be inferred from the conscious anamnesis—namely that the mountain sickness was a symbolical representation of the patient’s inability to climb any further—was confirmed by the dreams as a fact.

[304] Here we come upon something of the utmost importance for the applicability of dream-analysis: the dream describes the inner situation of the dreamer, but the conscious mind denies its truth and reality, or admits it only grudgingly. Consciously the dreamer could not see the slightest reason why he should not go steadily forward; on the contrary, he continued his ambitious climbing and refused to admit his own inability which subsequent events made all too plain. So long as we move in the conscious sphere, we are always unsure in such cases. The anamnesis can be interpreted in various ways. After all, the common soldier carries the marshal’s baton in his knapsack, and many a son of poor parents has achieved the highest success. Why should it not be the case here? Since my judgment is fallible, why should my conjecture be better than his? At this point the dream comes in as the expression of an involuntary, unconscious psychic process beyond the control of the conscious mind. It

shows the inner truth and reality of the patient as it really is: not as I conjecture it to be, and not as he would like it to be, but *as it is*. I have therefore made it a rule to regard dreams as I regard physiological facts: if sugar appears in the urine, then the urine contains sugar, and not albumen or urobilin or something else that might fit in better with my expectations. That is to say, I take dreams as diagnostically valuable facts.

[305] As is the way of all dreams, my little dream example gives us rather more than we expected. It gives us not only the aetiology of the neurosis but a prognosis as well. What is more, we even know exactly where the treatment should begin: we must prevent the patient from going full steam ahead. This is just what he tells himself in the dream.

[306] Let us for the time being content ourselves with this hint and return to our consideration of whether dreams enable us to throw light on the aetiology of a neurosis. The dreams I have cited actually do this. But I could equally well cite any number of initial dreams where there is no trace of an aetiological factor, although they are perfectly transparent. I do not wish for the present to consider dreams which call for searching analysis and interpretation.

[307] The point is this: there are neuroses whose real aetiology becomes clear only right at the end of an analysis, and other neuroses whose aetiology is relatively unimportant. This brings me back to the hypothesis from which we started, that for the purposes of therapy it is absolutely necessary to make the patient conscious of the aetiological factor. This hypothesis is little more than a hang-over from the old trauma theory. I do not of course deny that many neuroses are traumatic in origin; I simply contest the notion that all neuroses are of this nature and arise without exception from some crucial experience in childhood. Such a view necessarily results in the causalistic approach. The doctor must give his whole attention to the patient's past; he must always ask "Why?" and ignore the equally pertinent question "What for?" Often this has a most deleterious effect on the patient, who is thereby compelled to go searching about in his memory—perhaps for years—for some hypothetical event in his childhood, while things of immediate

importance are grossly neglected. The purely causalistic approach is too narrow and fails to do justice to the true significance either of the dream or of the neurosis. Hence an approach that uses dreams for the sole purpose of discovering the aetiological factor is biased and overlooks the main point of the dream. Our example indeed shows the aetiology clearly enough, but it also offers a prognosis or anticipation of the future as well as a suggestion about the treatment. There are in addition large numbers of initial dreams which do not touch the aetiology at all, but deal with quite other matters, such as the patient's attitude to the doctor. As an example of this I would like to tell you three dreams, all from the same patient, and each dreamt at the beginning of a course of treatment under three different analysts. Here is the first: "*I have to cross the frontier into another country, but cannot find the frontier and nobody can tell me where it is.*"

[308] The ensuing treatment proved unsuccessful and was broken off after a short time. The second dream is as follows: "*I have to cross the frontier, but the night is pitch-black and I cannot find the customs-house. After a long search I see a tiny light far off in the distance, and assume that the frontier is over there. But in order to get there, I have to pass through a valley and a dark wood in which I lose my way. Then I notice that someone is near me. Suddenly he clings to me like a madman and I awake in terror.*"

[309] This treatment, too, was broken off after a few weeks because the analyst unconsciously identified himself with the patient and the result was complete loss of orientation on both sides.

[310] The third dream took place under my treatment: "*I have to cross a frontier, or rather, I have already crossed it and find myself in a Swiss customs-house. I have only a handbag with me and think I have nothing to declare. But the customs official dives into my bag and, to my astonishment, pulls out a pair of twin beds.*"

[311] The patient had got married while under my treatment, and at first she developed the most violent resistance to her marriage. The aetiology of the neurotic resistance came to light only many months afterwards and

there is not a word about it in the dreams. They are without exception anticipations of the difficulties she is to have with the doctors concerned.

[312] These examples, like many others of the kind, may suffice to show that dreams are often anticipatory and would lose their specific meaning completely on a purely causalistic view. They afford unmistakable information about the analytical situation, the correct understanding of which is of the greatest therapeutic importance. Doctor A understood the situation correctly and handed the patient over to Doctor B. Under him she drew her own conclusions from the dream and decided to leave. My interpretation of the third dream was a disappointment to her, but the fact that the dream showed the frontier as already crossed encouraged her to go on in spite of all difficulties.

[313] Initial dreams are often amazingly lucid and clear-cut. But as the work of analysis progresses, the dreams tend to lose their clarity. If, by way of exception, they keep it we can be sure that the analysis has not yet touched on some important layer of the personality. As a rule, dreams get more and more opaque and blurred soon after the beginning of the treatment, and this makes the interpretation increasingly difficult. A further difficulty is that a point may soon be reached where, if the truth be told, the doctor no longer understands the situation as a whole. That he does not understand is proved by the fact that the dreams become increasingly obscure, for we all know that their "obscurity" is a purely subjective opinion of the doctor. To the understanding nothing is obscure; it is only when we do not understand that things appear unintelligible and muddled. In themselves dreams are naturally clear; that is, they are just what they must be under the given circumstances. If, from a later stage of treatment or from a distance of some years, we look back at these unintelligible dreams, we are often astounded at our own blindness. Thus when, as the analysis proceeds, we come upon dreams that are strikingly obscure in comparison with the illuminating initial dreams, the doctor should not be too ready to accuse the dreams of confusion or the patient of deliberate resistance; he would do better to take these findings as a sign of his own growing inability to understand—just as the psychiatrist who calls his patient "confused" should recognize that this is a projection and should rather call himself confused, because in reality it is he whose

wits are confused by the patient's peculiar behaviour. Moreover it is therapeutically very important for the doctor to admit his lack of understanding in time, for nothing is more unbearable to the patient than to be always understood. He relies far too much anyway on the mysterious powers of the doctor and, by appealing to his professional vanity, lays a dangerous trap for him. By taking refuge in the doctor's self-confidence and "profound" understanding, the patient loses all sense of reality, falls into a stubborn transference, and retards the cure.

[314] Understanding is clearly a very subjective process. It can be extremely one-sided, in that the doctor understands but not the patient. In such a case the doctor conceives it to be his duty to convince the patient, and if the latter will not allow himself to be convinced, the doctor accuses him of resistance. When the understanding is all on my side, I say quite calmly that I do not understand, for in the end it makes very little difference whether the doctor understands or not, but it makes all the difference whether the patient understands. Understanding should therefore be understanding in the sense of an agreement which is the fruit of joint reflection. The danger of a one-sided understanding is that the doctor may judge the dream from the standpoint of a preconceived opinion. His judgment may be in line with orthodox theory, it may even be fundamentally correct, but it will not win the patient's assent, he will not come to an understanding with him, and that is in the practical sense incorrect—incorrect because it anticipates and thus cripples the patient's development. The patient, that is to say, does not need to have a truth inculcated into him—if we do that, we only reach his head; he needs far more to grow up to this truth, and in that way we reach his heart, and the appeal goes deeper and works more powerfully.

[315] When the doctor's one-sided interpretation is based on mere agreement as to theory or on some other preconceived opinion, his chances of convincing the patient or of achieving any therapeutic results depend chiefly upon *suggestion*. Let no one deceive himself about this. In itself, suggestion is not to be despised, but it has serious limitations, not to speak of the subsidiary effects upon the patient's independence of character which, in the long run, we could very well do without. A practising analyst may be supposed to believe implicitly in the

significance and value of conscious realization, whereby hitherto unconscious parts of the personality are brought to light and subjected to conscious discrimination and criticism. It is a process that requires the patient to face his problems and that taxes his powers of conscious judgment and decision. It is nothing less than a direct challenge to his ethical sense, a call to arms that must be answered by the whole personality. As regards the maturation of personality, therefore, the analytical approach is of a higher order than suggestion, which is a species of magic that works in the dark and makes no ethical demands upon the personality. Methods of treatment based on suggestion are deceptive makeshifts; they are incompatible with the principles of analytical therapy and should be avoided if at all possible. Naturally suggestion can only be avoided if the doctor is conscious of its possibility. There is at the best of times always enough—and more than enough—unconscious suggestion.

[316] The analyst who wishes to rule out conscious suggestion must therefore consider every dream interpretation invalid until such time as a formula is found which wins the assent of the patient.

[317] The observance of this rule seems to me imperative when dealing with those dreams whose obscurity is evidence of the lack of understanding of both doctor and patient. The doctor should regard every such dream as something new, as a source of information about conditions whose nature is unknown to him, concerning which he has as much to learn as the patient. It goes without saying that he should give up all his theoretical assumptions and should in every single case be ready to construct a totally new theory of dreams. There are still boundless opportunities for pioneer work in this field. The view that dreams are merely the imaginary fulfilments of repressed wishes is hopelessly out of date. There are, it is true, dreams which manifestly represent wishes or fears, but what about all the other things? Dreams may contain ineluctable truths, philosophical pronouncements, illusions, wild fantasies, memories, plans, anticipations, irrational experiences, even telepathic visions, and heaven knows what besides. One thing we ought never to forget: almost half our life is passed in a more or less unconscious state. The dream is specifically the utterance of the

unconscious. Just as the psyche has a diurnal side which we call consciousness, so also it has a nocturnal side: the unconscious psychic activity which we apprehend as dreamlike fantasy. It is certain that the conscious mind consists not only of wishes and fears, but of vastly more besides; and it is highly probable that our dream psyche possesses a wealth of contents and living forms equal to or even greater than those of the conscious mind, which is characterized by concentration, limitation, and exclusion.

[318] This being so, it is imperative that we should not pare down the meaning of the dream to fit some narrow doctrine. We must remember that there are not a few patients who imitate the technical or theoretical jargon of the doctor, and do this even in their dreams, in accordance with the old tag, *Canis panem somniat, piscator pisces*. This is not to say that the fishes of which the fisherman dreams are fishes and nothing more. There is no language that cannot be misused. As may easily be imagined, the misuse often turns the tables on us; it even seems as if the unconscious had a way of strangling the doctor in the coils of his own theory. Therefore I leave theory aside as much as possible when analysing dreams—not entirely, of course, for we always need some theory to make things intelligible. It is on the basis of theory, for instance, that I expect dreams to have a meaning. I cannot prove in every case that this is so, for there are dreams which the doctor and the patient simply do not understand. But I have to make such an hypothesis in order to find courage to deal with dreams at all. To say that dreams add something important to our conscious knowledge, and that a dream which fails to do so has not been properly interpreted—that, too, is a theory. But I must make this hypothesis as well in order to explain to myself why I analyse dreams in the first place. All other hypotheses, however, about the function and the structure of dreams are merely rules of thumb and must be subjected to constant modification. In dream-analysis we must never forget, even for a moment, that we move on treacherous ground where nothing is certain but uncertainty. If it were not so paradoxical, one would almost like to call out to the dream interpreter: “Do anything you like, only don’t try to understand!”

[319] When we take up an obscure dream, our first task is not to understand and interpret, but to establish the context with minute care. By this I do *not* mean unlimited “free association” starting from any and every image in the dream, but a careful and conscious illumination of the interconnected associations objectively grouped round particular images. Many patients have first to be educated to this, for they resemble the doctor in their insuperable desire to understand and interpret offhand, especially when they have been primed by ill-digested reading or by a previous analysis that went wrong. They begin by associating in accordance with a theory, that is, they try to understand and interpret, and they nearly always get stuck. Like the doctor, they want to get behind the dream at once in the false belief that the dream is a mere façade concealing the true meaning. But the so-called façade of most houses is by no means a fake or a deceptive distortion; on the contrary, it follows the plan of the building and often betrays the interior arrangement. The “manifest” dream-picture is the dream itself and contains the whole meaning of the dream. When I find sugar in the urine, it is sugar and not just a façade for albumen. What Freud calls the “dream-façade” is the dream’s obscurity, and this is really only a projection of our own lack of understanding. We say that the dream has a false front only because we fail to see into it. We would do better to say that we are dealing with something like a text that is unintelligible not because it has a façade—a text has no façade—but simply because we cannot read it. We do not have to get behind such a text, but must first learn to read it.

[320] The best way to do this, as I have already remarked, is to establish the context. Free association will get me nowhere, any more than it would help me to decipher a Hittite inscription. It will of course help me to uncover all my own complexes, but for this purpose I have no need of a dream—I could just as well take a public notice or a sentence in a newspaper. Free association will bring out all my complexes, but hardly ever the meaning of a dream. To understand the dream’s meaning I must stick as close as possible to the dream images. When somebody dreams of a “deal table,” it is not enough for him to associate it with his writing-desk which does not happen to be made of deal. Supposing that nothing more occurs to the dreamer, this blocking has an objective meaning, for it

indicates that a particular darkness reigns in the immediate neighbourhood of the dream-image, and that is suspicious. We would expect him to have dozens of associations to a deal table, and the fact that there is apparently nothing is itself significant. In such cases I keep on returning to the image, and I usually say to my patient, “Suppose I had no idea what the words ‘deal table’ mean. Describe this object and give me its history in such a way that I cannot fail to understand what sort of a thing it is.”

[321] In this way we manage to establish almost the whole context of the dream-image. When we have done this for all the images in the dream we are ready for the venture of interpretation,

[322] Every interpretation is an hypothesis, an attempt to read an unknown text. An obscure dream, taken in isolation, can hardly ever be interpreted with any certainty. For this reason I attach little importance to the interpretation of single dreams. A relative degree of certainty is reached only in the interpretation of a series of dreams, where the later dreams correct the mistakes we have made in handling those that went before. Also, the basic ideas and themes can be recognized much better in a dream-series, and I therefore urge my patients to keep a careful record of their dreams and of the interpretations given. I also show them how to work out their dreams in the manner described, so that they can bring the dream and its context with them in writing to the consultation. At a later stage I get them to work out the interpretation as well. In this way the patient learns how to deal correctly with his unconscious without the doctor’s help.

[323] Were dreams nothing more than sources of information about factors of aetiological importance, the whole work of dream-interpretation could safely be left to the doctor. Again, if their only use was to provide the doctor with a collection of useful hints and psychological tips, my own procedure would be entirely superfluous. But since, as my examples have shown, dreams contain something more than practical helps for the doctor, dream-analysis deserves very special attention. Sometimes, indeed, it is a matter of life and death. Among many instances of this sort, there is one that has remained particularly impressive. It concerns a

colleague of mine, a man somewhat older than myself, whom I used to see from time to time and who always teased me about my dream-interpretations. Well, I met him one day in the street and he called out to me, “How are things going? Still interpreting dreams? By the way, I’ve had another idiotic dream. Does that mean something too?” This is what he had dreamed: “*I am climbing a high mountain, over steep snow-covered slopes. I climb higher and higher, and it is marvellous weather. The higher I climb the better I feel. I think, ‘If only I could go on climbing like this for ever!’ When I reach the summit my happiness and elation are so great that I feel I could mount right up into space. And I discover that I can actually do so: I mount upwards on empty air, and awake in sheer ecstasy.*”

[324] After some discussion, I said, “My dear fellow, I know you can’t give up mountaineering, but let me implore you not to go alone from now on. When you go, take two guides, and promise on your word of honour to follow them absolutely.” “Incorrigible!” he replied, laughing, and waved good-bye. I never saw him again. Two months later the first blow fell. When out alone, he was buried by an avalanche, but was dug out in the nick of time by a military patrol that happened to be passing. Three months afterwards the end came. He went on a climb with a younger friend, but without guides. A guide standing below saw him literally step out into the air while descending a rock face. He fell on the head of his friend, who was waiting lower down, and both were dashed to pieces far below. That was *ecstasis* with a vengeance![2]

[325] No amount of scepticism and criticism has yet enabled me to regard dreams as negligible occurrences. Often enough they appear senseless, but it is obviously we who lack the sense and ingenuity to read the enigmatic message from the nocturnal realm of the psyche. Seeing that at least half our psychic existence is passed in that realm, and that consciousness acts upon our nightly life just as much as the unconscious overshadows our daily life, it would seem all the more incumbent on medical psychology to sharpen its senses by a systematic study of dreams. Nobody doubts the importance of conscious experience; why then should we doubt the significance of unconscious happenings? They

also are part of our life, and sometimes more truly a part of it for weal or woe than any happenings of the day.

[326] Since dreams provide information about the hidden inner life and reveal to the patient those components of his personality which, in his daily behaviour, appear merely as neurotic symptoms, it follows that we cannot effectively treat him from the side of consciousness alone, but must bring about a change in and through the unconscious. In the light of our present knowledge this can be achieved only by the thorough and conscious assimilation of unconscious contents.

[327] "Assimilation" in this sense means mutual penetration of conscious and unconscious, and not—as is commonly thought and practised—a one-sided evaluation, interpretation, and deformation of unconscious contents by the conscious mind. As to the value and significance of unconscious contents in general, very mistaken views are current. It is well known that the Freudian school presents the unconscious in a thoroughly negative light, much as it regards primitive man as little better than a monster. Its nursery-tales about the terrible old man of the tribe and its teachings about the "infantile-perverse-criminal" unconscious have led people to make a dangerous ogre out of something perfectly natural. As if all that is good, reasonable, worth while, and beautiful had taken up its abode in the conscious mind! Have the horrors of the World War done nothing to open our eyes, so that we still cannot see that the conscious mind is even more devilish and perverse than the naturalness of the unconscious?

[328] The charge has recently been laid at my door that my teaching about the assimilation of the unconscious would undermine civilization and deliver up our highest values to sheer primitivity. Such an opinion can only be based on the totally erroneous supposition that the unconscious is a monster. It is a view that springs from fear of nature and the realities of life. Freud invented the idea of sublimation to save us from the imaginary claws of the unconscious. But what is real, what actually exists, cannot be alchemically sublimated, and if anything is apparently sublimated it never was what a false interpretation took it to be.

[329] The unconscious is not a demoniacal monster, but a natural entity which, as far as moral sense, aesthetic taste, and intellectual judgment go, is completely neutral. It only becomes dangerous when our conscious attitude to it is hopelessly wrong. To the degree that we repress it, its danger increases. But the moment the patient begins to assimilate contents that were previously unconscious, its danger diminishes. The dissociation of personality, the anxious division of the day-time and the nighttime sides of the psyche, cease with progressive assimilation. What my critic feared—the overwhelming of the conscious mind by the unconscious—is far more likely to ensue when the unconscious is excluded from life by being repressed, falsely interpreted, and depreciated.

[330] The fundamental mistake regarding the nature of the unconscious is probably this: it is commonly supposed that its contents have only one meaning and are marked with an unalterable plus or minus sign. In my humble opinion, this view is too naïve. The psyche is a self-regulating system that maintains its equilibrium just as the body does. Every process that goes too far immediately and inevitably calls forth compensations, and without these there would be neither a normal metabolism nor a normal psyche. In this sense we can take the theory of compensation as a basic law of psychic behaviour. Too little on one side results in too much on the other. Similarly, the relation between conscious and unconscious is compensatory. This is one of the best-proven rules of dream interpretation. When we set out to interpret a dream, it is always helpful to ask: What conscious attitude does it compensate?

[331] Compensation is not as a rule merely an illusory wishfulfilment, but an actual façt that becomes still more actual the more we repress it. We do not stop feeling thirsty by repressing our thirst. In the same way, the dream-content is to be regarded with due seriousness as an actuality that has to be fitted into the conscious attitude as a codetermining factor. If we fail to do this, we merely persist in that eccentric frame of mind which evoked the unconscious compensation in the first place. It is then difficult to see how we can ever arrive at a sane judgment of ourselves or at a balanced way of living.

[332] If it should occur to anyone to replace the conscious content by an unconscious one—and this is the prospect which my critics find so alarming—he would only succeed in repressing it, and it would then reappear as an unconscious compensation. The unconscious would thus have changed its face completely: it would now be timidly reasonable, in striking contrast to its former tone. It is not generally believed that the unconscious operates in this way, yet such reversals constantly take place and constitute its proper function. That is why every dream is an organ of information and control, and why dreams are our most effective aid in building up the personality.

[333] The unconscious does not harbour in itself any explosive materials unless an overweening or cowardly conscious attitude has secretly laid up stores of explosives there. All the more reason, then, for watching our step.

[334] From all this it should now be clear why I make it an heuristic rule, in interpreting a dream, to ask myself: What conscious attitude does it compensate? By so doing, I relate the dream as closely as possible to the conscious situation; indeed, I would even assert that without knowledge of the conscious situation the dream can never be interpreted with any degree of certainty. Only in the light of this knowledge is it possible to make out whether the unconscious content carries a plus or a minus sign. The dream is not an isolated event completely cut off from daily life and lacking its character. If it seems so to us, that is only the result of our lack of understanding, a subjective illusion. In reality the relation between the conscious mind and the dream is strictly causal, and they interact in the subtlest of ways.

[335] I should like to show by means of an example how important it is to evaluate the unconscious contents correctly. A young man brought me the following dream: “*My father is driving away from the house in his new car. He drives very clumsily, and I get very annoyed over his apparent stupidity. He goes this way and that, forwards and backwards, and manoeuvres the car into a dangerous position. Finally he runs into a wall and damages the car badly. I shout at him in a perfect fury that he ought to behave himself. My father only laughs, and then I see that he is*

dead drunk.” This dream has no foundation in fact. The dreamer is convinced that his father would never behave like that, even when drunk. As a motorist he himself is very careful and extremely moderate in the use of alcohol, especially when he has to drive. Bad driving, and even slight damage to the car, irritate him greatly. His relation to his father is positive. He admires him for being an unusually successful man. We can say, without any great feat of interpretation, that the dream presents a most unfavourable picture of the father. What, then, should we take its meaning to be for the son? Is his relation to his father good only on the surface, and does it really consist in over-compensated resistances? If so, we should have to give the dream-content a positive sign; we should have to tell the young man: “That is your real relation to your father.” But since I could find nothing neurotically ambivalent in the son’s real relation to his father, I had no warrant for upsetting the young man’s feelings with such a destructive pronouncement. To do so would have been a bad therapeutic blunder.

[336] But, if his relation to his father is in fact good, why must the dream manufacture such an improbable story in order to discredit the father? In the dreamer’s unconscious there must be some tendency to produce such a dream. Is that because he has resistances after all, perhaps fed by envy or some other inferior motive? Before we go out of our way to burden his conscience—and with sensitive young people this is always rather a dangerous proceeding—we would do better to inquire not *why* he had this dream, but what its purpose is. The answer in this case would be that his unconscious is obviously trying to take the father down a peg. If we regard this as a compensation, we are forced to the conclusion that his relation to his father is not only good, but actually too good. In fact he deserves the French soubriquet of *fils à papa*. His father is still too much the guarantor of his existence, and the dreamer is still living what I would call a provisional life. His particular danger is that he cannot see his own reality on account of his father; therefore the unconscious resorts to a kind of artificial blasphemy so as to lower the father and elevate the son. “An immoral business,” we may be tempted to say. An unintelligent father would probably take umbrage, but the compensation is entirely to

the point, since it forces the son to contrast himself with his father, which is the only way he could become conscious of himself.

[337] The interpretation just outlined was apparently the correct one, for it struck home. It won the spontaneous assent of the dreamer, and no real values were damaged, either for the father or for the son. But this interpretation was only possible when the whole conscious phenomenology of the father-son relationship had been carefully studied. Without a knowledge of the conscious situation the real meaning of the dream would have remained in doubt.

[338] For dream-contents to be assimilated, it is of overriding importance that no real values of the conscious personality should be damaged, much less destroyed, otherwise there is no one left to do the assimilating. The recognition of the unconscious is not a Bolshevist experiment which puts the lowest on top and thus re-establishes the very situation it intended to correct. We must see to it that the values of the conscious personality remain intact, for unconscious compensation is only effective when it co-operates with an integral consciousness. Assimilation is never a question of "this *or* that," but always of "this *and* that."

[339] Just as the interpretation of dreams requires exact knowledge of the conscious status quo, so the treatment of dream symbolism demands that we take into account the dreamer's philosophical, religious, and moral convictions. It is far wiser in practice not to regard dream-symbols semiotically, i.e., as signs or symptoms of a fixed character, but as true symbols, i.e., as expressions of a content not yet consciously recognized or conceptually formulated. In addition, they must be considered in relation to the dreamer's immediate state of consciousness. I say that this procedure is advisable *in practice* because in theory relatively fixed symbols do exist whose meaning must on no account be referred to anything known and formulable as a concept. If there were no such relatively fixed symbols it would be impossible to determine the structure of the unconscious, for there would be nothing that could in any way be laid hold of or described.

[340] It may seem strange that I should attribute an as it were indefinite content to these relatively fixed symbols. Yet if their content were not

indefinite, they would not be symbols at all, but signs or symptoms. We all know how the Freudian school operates with hard-and-fast sexual "symbols"—which in this case I would call "signs"—and endows them with an apparently definitive content, namely sexuality. Unfortunately Freud's idea of sexuality is incredibly elastic and so vague that it can be made to include almost anything. The word sounds familiar enough, but what it denotes is no more than an indeterminable x that ranges from the physiological activity of the glands at one extreme to the sublime reaches of the spirit at the other. Instead of yielding to a dogmatic conviction based on the illusion that we know something because we have a familiar word for it, I prefer to regard the symbol as an unknown quantity, hard to recognize and, in the last resort, never quite determinable. Take, for instance, the so-called phallic symbols which are supposed to stand for the *membrum virile* and nothing more, Psychologically speaking, the *membrum* is itself—as Kranefeldt points out in a recent work[3]—an emblem of something whose wider content is not at all easy to determine. But primitive people, who, like the ancients, make the freest use of phallic symbols, would never dream of confusing the phallus, as a ritualistic symbol, with the penis. The phallus always means the creative mana, the power of healing and fertility, the "extraordinarily potent," to use Lehmann's expression, whose equivalents in mythology and in dreams are the bull, the ass, the pomegranate, the yoni, the he-goat, the lightning, the horse's hoof, the dance, the magical cohabitation in the furrow, and the menstrual fluid, to mention only a few of the thousand other analogies. That which underlies all the analogies, and sexuality itself, is an archetypal image whose character is hard to define, but whose nearest psychological equivalent is perhaps the primitive mana-symbol.

[341] All these symbols are relatively fixed, but in no single case can we have the *a priori* certainty that in practice the symbol must be interpreted in that way.

[342] Practical necessity may call for something quite different. Of course, if we had to give an exhaustive scientific interpretation of a dream, in accordance with a theory, we should have to refer every such symbol to an archetype. But in practice that can be a positive mistake, for the patient's psychological state at the moment may require anything but a

digression into dream theory. It is therefore advisable to consider first and foremost the meaning of the symbol in relation to the conscious situation—in other words, to treat the symbol as if it were not fixed. This is as much as to say that we must renounce all preconceived opinions, however knowing they make us feel, and try to discover what things mean for the patient. In so doing, we shall obviously not get very far towards a theoretical interpretation; indeed we shall probably get stuck at the very beginning. But if the practitioner operates too much with fixed symbols, there is a danger of his falling into mere routine and pernicious dogmatism, and thus failing his patient. Unfortunately I must refrain from illustrating this point, for I should have to go into greater detail than space here permits. Moreover I have published sufficient material elsewhere in support of my statements.

[343] It frequently happens at the very beginning of the treatment that a dream will reveal to the doctor, in broad perspective, the whole programme of the unconscious. But for practical reasons it may be quite impossible to make clear to the patient the deeper meaning of the dream. In this respect, too, we are limited by practical considerations. Such insight is rendered possible by the doctor's knowledge of relatively fixed symbols. It can be of the greatest value in diagnosis as well as in prognosis. I was once consulted about a seventeen-year-old girl. One specialist had conjectured that she might be in the first stages of progressive muscular atrophy, while another thought that it was a case of hysteria. In view of the second opinion, I was called in. The clinical picture made me suspect an organic disease, but there were signs of hysteria as well. I asked for dreams. The patient answered at once: "Yes, I have terrible dreams. Only recently I dreamt *I was coming home at night. Everything is as quiet as death. The door into the living-room is half open, and I see my mother hanging from the chandelier, swinging to and fro in the cold wind that blows in through the open windows*. Another time I dreamt that *a terrible noise broke out in the house at night. I get up and discover that a frightened horse is tearing through the rooms. At last it finds the door into the hall, and jumps through the hall window from the fourth floor into the street below. I was terrified when I saw it lying there, all mangled."*

[344] The gruesome character of the dreams is alone sufficient to make one pause. All the same, other people have anxiety dreams now and then. We must therefore look more closely into the meaning of the two main symbols, “mother” and “horse.” They must be equivalents, for they both do the same thing: they commit suicide. “Mother” is an archetype and refers to the place of origin, to nature, to that which passively creates, hence to substance and matter, to materiality, the womb, the vegetative functions. It also means the unconscious, our natural and instinctive life, the physiological realm, the body in which we dwell or are contained; for the “mother” is also the matrix, the hollow form, the vessel that carries and nourishes, and it thus stands psychologically for the foundations of consciousness. Being inside or contained in something also suggests darkness, something nocturnal and fearful, hemming one in. These allusions give the idea of the mother in many of its mythological and etymological variants; they also represent an important part of the Yin idea in Chinese philosophy. This is no individual acquisition of a seventeen-year-old girl; it is a collective inheritance, alive and recorded in language, inherited along with the structure of the psyche and therefore to be found at all times and among all peoples.

[345] The word “mother,” which sounds so familiar, apparently refers to the best-known, the individual mother—to “my mother.” But the mother-symbol points to a darker background which eludes conceptual formulation and can only be vaguely apprehended as the hidden, nature-bound life of the body. Yet even this is too narrow and excludes too many vital subsidiary meanings. The underlying, primary psychic reality is so inconceivably complex that it can be grasped only at the farthest reach of intuition, and then but very dimly. That is why it needs symbols.

[346] If we apply our findings to the dream, its interpretation will be: The unconscious life is destroying itself. That is the dream’s message to the conscious mind of the dreamer and to anybody who has ears to hear.

[347] “Horse” is an archetype that is widely current in mythology and folklore. As an animal it represents the non-human psyche, the subhuman, animal side, the unconscious. That is why horses in folklore sometimes see visions, hear voices, and speak. As a beast of burden it is

closely related to the mother-archetype (witness the Valkyries that bear the dead hero to Valhalla, the Trojan horse, etc.). As an animal lower than man it represents the lower part of the body and the animal impulses that rise from there. The horse is dynamic and vehicular power: it carries one away like a surge of instinct. It is subject to panics like all instinctive creatures who lack higher consciousness. Also it has to do with sorcery and magical spells–especially the black night-horses which herald death.

[348] It is evident, then, that “horse” is an equivalent of “mother” with a slight shift of meaning. The mother stands for life at its origin, the horse for the merely animal life of the body. If we apply this meaning to the text of our dream, its interpretation will be: The animal life is destroying itself.

[349] The two dreams make nearly identical statements, but, as is usually the case, the second is the more specific. Note the peculiar subtlety of the dream: there is no mention of the death of the individual. It is notorious that one often dreams of one’s own death, but that is no serious matter. When it is really a question of death, the dream speaks another language.

[350] Both dreams point to a grave organic disease with a fatal outcome. This prognosis was soon confirmed.

[351] As for the relatively fixed symbols, this example gives a fair idea of their general nature. There are a great many of them, and all are individually marked by subtle shifts of meaning. It is only through comparative studies in mythology, folklore, religion, and philology that we can evaluate their nature scientifically. The evolutionary stratification of the psyche is more clearly discernible in the dream than in the conscious mind. In the dream, the psyche speaks in images, and gives expression to instincts, which derive from the most primitive levels of nature. Therefore, through the assimilation of unconscious contents, the momentary life of consciousness can once more be brought into harmony with the law of nature from which it all too easily departs, and the patient can be led back to the natural law of his own being.

[352] I have not been able, in so short a space, to deal with anything but the elements of the subject. I could not put together before your eyes, stone

by stone, the edifice that is reared in every analysis from the materials of the unconscious and finally reaches completion in the restoration of the total personality. The way of successive assimilations goes far beyond the curative results that specifically concern the doctor. It leads in the end to that distant goal which may perhaps have been the first urge to life: the complete actualization of the whole human being, that is, individuation. We physicians may well be the first conscious observers of this dark process of nature. As a rule we see only the pathological phase of development, and we lose sight of the patient as soon as he is cured. Yet it is only after the cure that we would really be in a position to study the normal process, which may extend over years and decades. Had we but a little knowledge of the ends toward which the unconscious development is tending, and were the doctor's psychological insight not drawn exclusively from the pathological phase, we should have a less confused idea of the processes mediated to the conscious mind by dreams and a clearer recognition of what the symbols point to. In my opinion, every doctor should understand that every procedure in psychotherapy, and particularly the analytical procedure, breaks into a purposeful and continuous process of development, now at this point and now at that, and thus singles out separate phases which seem to follow opposing courses. Each individual analysis by itself shows only one part or one aspect of the deeper process, and for this reason nothing but hopeless confusion can result from comparative case histories. For this reason, too, I have preferred to confine myself to the rudiments of the subject and to practical considerations; for only in closest *contact* with the everyday facts can we come to anything like a satisfactory understanding.

III

THE PSYCHOLOGY OF THE TRANSFERENCE[1]

INTERPRETED IN CONJUNCTION WITH A SET OF ALCHEMICAL PICTURES

Quaero non pono, nihil hic determino dictans Coniicio, conor, confero, tento, rogo.…

(I inquire, I do not assert; I do not here determine anything with final assurance; I conjecture, try, compare, attempt, ask.…)

—Motto to Christian Knorr von Rosenroth,
Adumbratio Kabbalae Christianae

TO MY WIFE

FOREWORD

Everyone who has had practical experience of psychotherapy knows that the process which Freud called "transference" often presents a difficult problem. It is probably no exaggeration to say that almost all cases requiring lengthy treatment gravitate round the phenomenon of transference, and that the success or failure of the treatment appears to be bound up with it in a very fundamental way. Psychology, therefore, cannot very well overlook or avoid this problem, nor should the psychotherapist pretend that the so-called "resolution of the transference" is just a matter of course. We meet with a similar optimism in the treatment of "sublimation," a process closely connected with the transference. In discussing these phenomena, people often talk as though they could be dealt with by reason, or by intelligence and will, or could be remedied by the ingenuity and art of a doctor armed with superior technique. This euphemistic and propitiatory approach is useful enough when the situation is not exactly simple and no easy results are to be had; but it has the disadvantage of disguising the difficulty of the problem and thus preventing or postponing deeper investigation. Although I originally agreed with Freud that the importance of the transference could hardly be overestimated, increasing experience has forced me to realize that its importance is relative. The transference is like those medicines which are a panacea for one and pure poison for another. In one case its appearance denotes a change for the better, in another it is a hindrance and an aggravation, if not a change for the worse, and in a third it is relatively unimportant. Generally speaking, however, it is a critical phenomenon of varying shades of meaning and its absence is as significant as its presence.

In this book I am concerned with the "classical" form of transference and its phenomenology. As it is a form of relationship, it always implies a vis-à-vis. Where it is negative or not there at all, the vis-à-vis plays an unimportant part, as is generally the case, for instance, when there is an inferiority complex coupled with a compensating need for self-assertion.[2]

It may seem strange to the reader that, in order to throw light on the transference, I should turn to something so apparently remote as alchemical symbolism. But anyone who has read my book Psychology and Alchemy *will know what close connections exist between alchemy and those phenomena which must, for practical reasons, be considered in the psychology of the unconscious. Consequently he will not be surprised to learn that this phenomenon, shown by experience to be so frequent and so important, also has its place in the symbolism and imagery of alchemy. Such images are not likely to be conscious representations of the transference relationship; rather, they unconsciously take that relationship for granted, and for this reason we may use them as an Ariadne thread to guide us in our argument.*

The reader will not find an account of the clinical phenomena of transference in this book. It is not intended for the beginner who would first have to be instructed in such matters, but is addressed exclusively to those who have already gained sufficient experience from their own practice. My object is to provide some kind of orientation in this newly discovered and still unexplored territory, and to acquaint the reader with some of its problems. In view of the great difficulties that beset our understanding here, I would like to stress the provisional character of my investigation. I have tried to put together my observations and ideas, and I recommend them to the reader's consideration in the hope of directing his attention to certain points of view whose importance has forced itself upon me in the course of time. I am afraid that my description will not be easy reading for those who do not possess some knowledge of my earlier works. I have therefore indicated in the footnotes those of my writings which might be of assistance.

The reader who approaches this book more or less unprepared will perhaps be astonished at the amount of historical material I bring to bear on my investigation. The reason and inner necessity for this lie in the fact that it is only possible to come to a right understanding and appreciation of a contemporary psychological problem when we can reach a point outside our own time from which to observe it. This point can only be some past epoch that was concerned with the same problems, although under different conditions and in other forms. The comparative analysis thus made possible naturally demands a correspondingly detailed account of the historical *aspects of the situation. These could be described much more succinctly if we were dealing with well-known material, where a few references and hints would suffice. But unfortunately that is not the case, since the psychology of alchemy here under review is almost virgin territory. I must therefore take it for granted that the reader has some knowledge of my* Psychology and Alchemy, *otherwise it will be hard for him to gain access to the present volume. The reader whose professional and personal experience has sufficiently acquainted him with the scope of the transference problem will forgive me this expectation.*

Although the present study can stand on its own, it forms at the same time an introduction to a more comprehensive account of the problem of opposites in alchemy, and of their phenomenology and synthesis, which will appear later under the title Mysterium Coniunctionis. *I would like to express my thanks here to all those who read my manuscript and drew attention to defects. My particular thanks are due to Dr Marie-Louise von Franz for her generous help.*

C. G. JUNG

Autumn, 1945

INTRODUCTION

Bellica pax, vulnus dulce, suave malum.
(A warring peace, a sweet wound, a mild evil.)
—JOHN GOWER, *Confessio amantis,* II, p. 35

1

[353] The fact that the idea of the mystic marriage plays such an important part in alchemy is not so surprising when we remember that the term most frequently employed for it, *coniunctio*, referred in the first place to what we now call chemical combination, and that the substances or "bodies" to be combined were drawn together by what we would call affinity. In days gone by, people used a variety of terms which all expressed a human, and more particularly an erotic, relationship, such as *nuptiae, matrimonium, coniugium, amicitia, attractio, adulatio*. Accordingly the bodies to be combined were thought of as *agens et patiens*, as *vir* or *masculus*, and as *femina, mulier, femineus;* or they were described more picturesquely as dog and bitch,[1] horse (stallion) and donkey,[2] cock and hen,[3] and as the winged and wingless dragon.[4] The more anthropomorphic and theriomorphic the terms become, the more obvious is the part played by creative fantasy and thus by the unconscious, and the more we see how the natural philosophers of old were tempted, as their thoughts explored the dark, unknown qualities of matter, to slip away from a strictly chemical investigation and to fall under the spell of the "myth of matter." Since there can never be absolute freedom from prejudice, even the most objective and impartial investigator is liable to become the victim of some unconscious assumption upon entering a region where the darkness has never been illuminated and where he can recognize nothing. This need not necessarily be a misfortune, since the idea which then presents itself as a substitute for the unknown will take the form of an archaic though not

inapposite analogy. Thus Kekulé’s vision of the dancing couples,[5] which first put him on the track of the structure of certain carbon compounds, namely the benzene ring, was surely a vision of the *coniunctio*, the mating that had preoccupied the minds of the alchemists for seventeen centuries. It was precisely this image that had always lured the mind of the investigator away from the problem of chemistry and back to the ancient myth of the royal or divine marriage; but in Kekulé’s vision it reached its chemical goal in the end, thus rendering the greatest imaginable service both to our understanding of organic compounds and to the subsequent unprecedented advances in synthetic chemistry. Looking back, we can say that the alchemists had keen noses when they made this *arcanum arcanorum,*[6] this *donum Dei et secretum altissimi,*[7] this inmost mystery of the art of gold-making, the climax of their work. The subsequent confirmation of the other idea central to gold-making—the transmutability of chemical elements—also takes a worthy place in this belated triumph of alchemical thought. Considering the eminently practical and theoretical importance of these two key ideas, we might well conclude that they were intuitive anticipations whose fascination can be explained in the light of later developments.[8]

[354] We find, however, that alchemy did not merely change into chemistry by gradually discovering how to break away from its mythological premises, but that it also became, or had always been, a kind of mystic philosophy. The idea of the *coniunctio* served on the one hand to shed light on the mystery of chemical combination, while on the other it became the symbol of the *unio mystica*, since, as a mythologem, it expresses the archetype of the union of opposites. Now the archetypes do not represent anything external, non-psychic, although they do of course owe the concreteness of their imagery to impressions received from without. Rather, independently of, and sometimes in direct contrast to, the outward forms they may take, they represent the life and essence of a non-individual psyche. Although this psyche is innate in every individual it can neither be modified nor possessed by him personally. It is the same in the individual as it is in the crowd and ultimately in everybody. It is the precondition of each individual psyche, just as the sea is the carrier of the individual wave.

[355] The alchemical image of the *coniunctio*, whose practical importance was proved at a later stage of development, is equally valuable from the psychological point of view: that is to say, it plays the same role in the exploration of the darkness of the psyche as it played in the investigation of the riddle of matter. Indeed, it could never have worked so effectively in the material world had it not already possessed the power to fascinate and thus to fix the attention of the investigator along those lines. The *coniunctio* is an *a priori* image that occupies a prominent place in the history of man's mental development. If we trace this idea back we find it has two sources in alchemy, one Christian, the other pagan. The Christian source is unmistakably the doctrine of Christ and the Church, *sponsus* and *sponsa*, where Christ takes the role of Sol and the Church that of Luna.[9] The pagan source is on the one hand the hierosgamos,[10] on the other the marital union of the mystic with God.[11] These psychic experiences and the traces they have left behind in tradition explain much that would otherwise be totally unintelligible in the strange world of alchemy and its secret language.

[356] As we have said, the image of the *coniunctio* has always occupied an important place in the history of the human mind. Recent developments in medical psychology have, through observation of the mental processes in neuroses and psychoses, forced us to become more and more thorough in our investigation of the psychic background, commonly called the unconscious. It is psychotherapy above all that makes such investigations necessary, because it can no longer be denied that morbid disturbances of the psyche are not to be explained exclusively by the changes going on in the body or in the conscious mind; we must adduce a third factor by way of explanation, namely hypothetical unconscious processes.[12]

[357] Practical analysis has shown that unconscious contents are invariably projected at first upon concrete persons and situations. Many projections can ultimately be integrated back into the individual once he has recognized their subjective origin; others resist integration, and although they may be detached from their original objects, they thereupon transfer themselves to the doctor. Among these contents the relation to the parent of opposite sex plays a particularly important part, i.e., the relation of son

to mother, daughter to father, and also that of brother to sister.[13] As a rule this complex cannot be integrated completely, since the doctor is nearly always put in the place of the father, the brother, and even (though naturally more rarely) the mother. Experience has shown that this projection persists with all its original intensity (which Freud regarded as aetiological), thus creating a bond that corresponds in every respect to the initial infantile relationship, with a tendency to recapitulate all the experiences of childhood on the doctor. In other words, the neurotic maladjustment of the patient is now *transferred* to him.[14] Freud, who was the first to recognize and describe this phenomenon, coined the term "transference neurosis."[15]

[358] This bond is often of such intensity that we could almost speak of a "combination." When two chemical substances combine, both are altered. This is precisely what happens in the transference. Freud rightly recognized that this bond is of the greatest therapeutic importance in that it gives rise to a *mixtum compositum* of the doctor's own mental health and the patient's maladjustment. In Freudian technique the doctor tries to ward off the transference as much as possible—which is understandable enough from the human point of view, though in certain cases it may considerably impair the therapeutic effect. It is inevitable that the doctor should be influenced to a certain extent and even that his nervous health should suffer.[16] He quite literally "takes over" the sufferings of his patient and shares them with him. For this reason he runs a risk—and must run it in the nature of things.[17] The enormous importance that Freud attached to the transference phenomenon became clear to me at our first personal meeting in 1907. After a conversation lasting many hours there came a pause. Suddenly he asked me out of the blue, "And what do you think about the transference?" I replied with the deepest conviction that it was the alpha and omega of the analytical method, whereupon he said, "Then you have grasped the main thing."

[359] The great importance of the transference has often led to the mistaken idea that it is absolutely indispensable for a cure, that it must be demanded from the patient, so to speak. But a thing like that can no more be demanded than faith, which is only valuable when it is spontaneous.

Enforced faith is nothing but spiritual cramp. Anyone who thinks that he must "demand" a transference is forgetting that this is only one of the therapeutic factors, and that the very word "transference" is closely akin to "projection"—a phenomenon that cannot possibly be demanded.[18] I personally am always glad when there is only a mild transference or when it is practically unnoticeable. Far less claim is then made upon one as a person, and one can be satisfied with other therapeutically effective factors. Among these the patient's own insight plays an important part, also his goodwill, the doctor's authority, suggestion,[19] good advice,[20] understanding, sympathy, encouragement, etc. Naturally the more serious cases do not come into this category.

[360] Careful analysis of the transference phenomenon yields an extremely complicated picture with such startlingly pronounced features that we are often tempted to pick out one of them as the most important and then exclaim by way of explanation: "Of course, it's nothing but…!" I am referring chiefly to the erotic or sexual aspect of transference fantasies. The existence of this aspect is undeniable, but it is not always the only one and not always the essential one. Another is the will to power (described by Adler), which proves to be coexistent with sexuality, and it is often very difficult to make out which of the two predominates. These two aspects alone offer sufficient grounds for a paralysing conflict.

[361] There are, however, other forms of instinctive *concupiscentia* that come more from "hunger," from wanting to possess; others again are based on the instinctive negation of desire, so that life seems to be founded on fear or self-destruction. A certain *abaissement du niveau mental*, i.e., a weakness in the hierarchical order of the ego, is enough to set these instinctive urges and desires in motion and bring about a dissociation of personality—in other words, a multiplication of its centres of gravity. (In schizophrenia there is an actual fragmentation of personality.) These dynamic components must be regarded as real or symptomatic, vitally decisive or merely syndromal, according to the degree of their predominance. Although the strongest instincts undoubtedly demand concrete realization and generally enforce it, they cannot be considered exclusively biological since the course they actually follow is subject to powerful modifications coming from the personality

itself. If a man's temperament inclines him to a spiritual attitude, even the concrete activity of the instincts will take on a certain symbolical character. This activity is no longer the mere satisfaction of instinctual impulses, for it is now associated with or complicated by "meanings." In the case of purely syndromal instinctive processes, which do not demand concrete realization to the same extent, the symbolical character of their fulfilment is all the more marked. The most vivid examples of these complications are probably to be found in erotic phenomenology. Four stages of eroticism were known in the late classical period: Hawwah (Eve), Helen (of Troy), the Virgin Mary, and Sophia. The series is repeated in Goethe's *Faust:* in the figures of Gretchen as the personification of a purely instinctual relationship (Eve); Helen as an anima figure;[21] Mary as the personification of the "heavenly," i.e., Christian or religious, relationship; and the "eternal feminine" as an expression of the alchemical *Sapientia*. As the nomenclature shows, we are dealing with the heterosexual Eros or anima-figure in four stages, and consequently with four stages of the Eros cult. The first stage—Hawwah, Eve, earth—is purely biological; woman is equated with the mother and only represents something to be fertilized. The second stage is still dominated by the sexual Eros, but on an aesthetic and romantic level where woman has already acquired some value as an individual. The third stage raises Eros to the heights of religious devotion and thus spiritualizes him: Hawwah has been replaced by spiritual motherhood. Finally, the fourth stage illustrates something which unexpectedly goes beyond the almost unsurpassable third stage: *Sapientia*. How can wisdom transcend the most holy and the most pure?—Presumably only by virtue of the truth that the less sometimes means the more. This stage represents a spiritualization of Helen and consequently of Eros as such. That is why *Sapientia* was regarded as a parallel to the Shulamite in the Song of Songs.

[362] Not only are there different instincts which cannot forcibly be reduced to one another, there are also different levels on which they move. In view of this far from simple situation, it is small wonder that the transference—also an instinctive process, in part—is very difficult to interpret and evaluate. The instincts and their specific fantasy-contents

are partly concrete, partly symbolical (i.e., “unreal”), sometimes one, sometimes the other, and they have the same paradoxical character when they are projected. The transference is far from being a simple phenomenon with only one meaning, and we can never make out beforehand what it is all about. The same applies to its specific content, commonly called incest. We know that it is possible to interpret the fantasy-contents of the instincts either as *signs,* as self-portraits of the instincts, i.e., reductively; or as *symbols,* as the spiritual meaning of the natural instinct. In the former case the instinctive process is taken to be “real” and in the latter “unreal.”

[363] In any particular case it is often almost impossible to say what is “spirit” and what is “instinct.” Together they form an impenetrable mass, a veritable magma sprung from the depths of primeval chaos. When one meets such contents one immediately understands why the psychic equilibrium of the neurotic is disturbed, and why the whole psychic system is broken up in schizophrenia. They emit a fascination which not only grips—and has already gripped—the patient, but can also have an inductive effect on the unconscious of the impartial spectator, in this case the doctor. The burden of these unconscious and chaotic contents lies heavy on the patient; for, although they are present in everybody, it is only in him that they have become active, and they isolate him in a spiritual loneliness which neither he nor anybody else can understand and which is bound to be misinterpreted. Unfortunately, if we do not feel our way into the situation and approach it purely from the outside, it is only too easy to dismiss it with a light word or to push it in the wrong direction. This is what the patient has long been doing on his own account, giving the doctor every opportunity for misinterpretation. At first the secret seems to lie with his parents, but when this tie has been loosed and the projection withdrawn, the whole weight falls upon the doctor, who is faced with the question: “What are *you* going to do about the transference?”

[364] The doctor, by voluntarily and consciously taking over the psychic sufferings of the patient, exposes himself to the overpowering contents of the unconscious and hence also to their inductive action. The case begins to “fascinate” him. Here again it is easy to explain this in terms of

personal likes and dislikes, but one overlooks the fact that this would be an instance of *ignotum per ignotius*. In reality these personal feelings, if they exist at all in any decisive degree, are governed by those same unconscious contents which have become activated. An unconscious tie is established and now, in the patient's fantasies, it assumes all the forms and dimensions so profusely described in the literature. The patient, by bringing an activated unconscious content to bear upon the doctor, constellates the corresponding unconscious material in him, owing to the inductive effect which always emanates from projections in greater or lesser degree. Doctor and patient thus find themselves in a relationship founded on mutual unconsciousness.

[365] It is none too easy for the doctor to make himself aware of this fact. One is naturally loath to admit that one could be affected in the most personal way by just any patient. But the more unconsciously this happens, the more the doctor will be tempted to adopt an "apotropaic" attitude, and the *persona medici* he hides behind is, or rather seems to be, an admirable instrument for this purpose. Inseparable from the *persona* is the doctor's routine and his trick of knowing everything beforehand, which is one of the favourite props of the well-versed practitioner and of all infallible authority. Yet this lack of insight is an ill counsellor, for the unconscious infection brings with it the therapeutic possibility—which should not be underestimated—of the illness being transferred to the doctor. We must suppose as a matter of course that the doctor is the better able to make the constellated contents conscious, otherwise it would only lead to mutual imprisonment in the same state of unconsciousness. The greatest difficulty here is that contents are often activated in the doctor which might normally remain latent. He might perhaps be so normal as not to need any such unconscious standpoints to compensate his conscious situation. At least this is often how it looks, though whether it is so in a deeper sense is an open question. Presumably he had good reasons for choosing the profession of psychiatrist and for being particularly interested in the treatment of the psychoneuroses; and he cannot very well do that without gaining some insight into his own unconscious processes. Nor can his concern with the unconscious be explained entirely by a free choice of interests, but rather by a fateful

disposition which originally inclined him to the medical profession. The more one sees of human fate and the more one examines its secret springs of action, the more one is impressed by the strength of unconscious motives and by the limitations of free choice. The doctor knows—or at least he should know—that he did not choose this career by chance; and the psychotherapist in particular should clearly understand that psychic infections, however superfluous they seem to him, are in fact the predestined concomitants of his work, and thus fully in accord with the instinctive disposition of his own life. This realization also gives him the right attitude to his patient. The patient then means something to him personally, and this provides the most favourable basis for treatment.

3

[366] In the old pre-analytical psychotherapy, going right back to the doctors of the Romantic Age, the transference was already defined as "rapport." It forms the basis of therapeutic influence once the patient's initial projections are dissolved. During this work it becomes clear that the projections can also obscure the judgment of the doctor—to a lesser extent, of course, for otherwise all therapy would be impossible. Although we may justifiably expect the doctor at the very least to be acquainted with the effects of the unconscious on his own person, and may therefore demand that anybody who intends to practise psychotherapy should first submit to a training analysis, yet even the best preparation will not suffice to teach him everything about the unconscious. A complete "emptying" of the unconscious is out of the question, if only because its creative powers are continually producing new formations. Consciousness, no matter how extensive it may be, must always remain the smaller circle within the greater circle of the unconscious, an island surrounded by the sea; and, like the sea itself, the unconscious yields an endless and self-replenishing abundance of living creatures, a wealth beyond our fathoming. We may long have known the meaning, effects, and characteristics of unconscious contents without ever having fathomed their depths and potentialities, for they are capable of infinite variation and can never be depotentiated. The only way to get at them in practice is to try to attain a conscious attitude which allows the unconscious to co-operate instead of being driven into opposition.

[367] Even the most experienced psychotherapist will discover again and again that he is caught up in a bond, a combination resting on mutual unconsciousness. And though he may believe himself to be in possession of all the necessary knowledge concerning the constellated archetypes, he will in the end come to realize that there are very many things indeed of which his academic knowledge never dreamed. Each new case that requires thorough treatment is pioneer work, and every trace of routine then proves to be a blind alley. Consequently the higher psychotherapy is a most exacting business and sometimes it sets tasks which challenge not only our understanding or our sympathy, but the whole man. The doctor is inclined to demand this total effort from his patient, yet he must realize that this same demand only works if he is aware that it applies also to himself.

[368] I said earlier that the contents which enter into the transference were as a rule originally projected upon the parents or other members of the family. Owing to the fact that these contents seldom or never lack an erotic aspect or are genuinely sexual in substance (apart from the other factors already mentioned), an incestuous character does undoubtedly attach to them, and this has given rise to the Freudian theory of incest. Their exogamous transference to the doctor does not alter the situation. He is merely drawn into the peculiar atmosphere of family incest through the projection. This necessarily leads to an unreal intimacy which is highly distressing to both doctor and patient and arouses resistance and doubt on both sides. The violent repudiation of Freud’s original discoveries gets us nowhere, for we are dealing with an empirically demonstrable fact which meets with such universal confirmation that only the ignorant still try to oppose it. But the interpretation of this fact is, in the very nature of the case, highly controversial. Is it a genuine incestuous instinct or a pathological variation? Or is the incest one of the “arrangements” (Adler) of the will to power? Or is it regression of normal libido[22] to the infantile level, from fear of an apparently impossible task in life?[23] Or is all incest-fantasy purely symbolical, and thus a reactivation of the incest archetype, which plays such an important part in the history of the human mind?

[369] For all these widely differing interpretations we can marshal more or less satisfactory arguments. The view which probably causes most offence is that incest is a genuine instinct. But, considering the almost universal prevalence of the incest taboo, we may legitimately remark that a thing which is not liked and desired generally requires no prohibition. In my opinion, each of these interpretations is justified up to a point, because all the corresponding shades of meaning are present in individual cases, though with varying intensity. Sometimes one aspect predominates and sometimes another. I am far from asserting that the above list could not be supplemented further.

[370] In practice, however, it is of the utmost importance how the incestuous aspect is interpreted. The explanation will vary according to the nature of the case, the stage of treatment, the perspicacity of the patient, and the maturity of his judgment.

[371] The existence of the incest element involves not only an intellectual difficulty but, worst of all, an emotional complication of the therapeutic situation. It is the hiding place for all the most secret, painful, intense, delicate, shamefaced, timorous, grotesque, unmoral, and at the same time the most sacred feelings which go to make up the indescribable and inexplicable wealth of human relationships and give them their compelling power. Like the tentacles of an octopus they twine themselves invisibly round parents and children and, through the transference, round doctor and patient. This binding force shows itself in the irresistible strength and obstinacy of the neurotic symptom and in the patient's desperate clinging to the world of infancy or to the doctor. The word "possession" describes this state in a way that could hardly be bettered.

[372] The remarkable effects produced by unconscious contents allow us to infer something about their energy. All unconscious contents, once they are activated—i.e., have made themselves felt—possess as it were a specific energy which enables them to manifest themselves everywhere (like the incest motif, for instance). But this energy is normally not sufficient to thrust the content into consciousness. For that there must be a certain predisposition on the part of the conscious mind, namely a deficit in the form of loss of energy. The energy so lost raises the psychic

potency of certain compensating contents in the unconscious. The *abaissement du niveau mental*, the energy lost to consciousness, is a phenomenon which shows itself most drastically in the “loss of soul” among primitive peoples, who also have interesting psychotherapeutic methods for recapturing the soul that has gone astray. This is not the place to go into these matters in detail, so a bare mention must suffice.[24] Similar phenomena can be observed in civilized man. He too is liable to a sudden loss of initiative for no apparent reason. The discovery of the real reason is no easy task and generally leads to a somewhat ticklish discussion of things lying in the background. Carelessness of all kinds, neglected duties, tasks postponed, wilful outbursts of defiance, and so on, all these can dam up his vitality to such an extent that certain quanta of energy, no longer finding a conscious outlet, stream off into the unconscious, where they activate other, compensating contents, which in turn begin to exert a compulsive influence on the conscious mind. (Hence the very common combination of extreme neglect of duty and a compulsion neurosis.)

[373] This is one way in which loss of energy may come about. The other way causes loss not through a malfunctioning of the conscious mind but through a “spontaneous” activation of unconscious contents, which react secondarily upon consciousness. There are moments in human life when a new page is turned. New interests and tendencies appear which have hitherto received no attention, or there is a sudden change of personality (a so-called mutation of character). During the incubation period of such a change we can often observe a loss of conscious energy: the new development has drawn off the energy it needs from consciousness. This lowering of energy can be seen most clearly before the onset of certain psychoses and also in the empty stillness which precedes creative work.[25]

[374] The remarkable potency of unconscious contents, therefore, always indicates a corresponding weakness in the conscious mind and its functions. It is as though the latter were threatened with impotence. For primitive man this danger is one of the most terrifying instances of “magic.” So we can understand why this secret fear is also to be found among civilized people. In serious cases it is the secret fear of going mad; in less serious, the fear of the unconscious—a fear which even the

normal person exhibits in his resistance to psychological views and explanations. This resistance borders on the grotesque when it comes to scouting all psychological explanations of art, philosophy, and religion, as though the human psyche had, or should have, absolutely nothing to do with these things. The doctor knows these well-defended zones from his consulting hours: they are reminiscent of island fortresses from which the neurotic tries to ward off the octopus. (“Happy neurosis island,” as one of my patients called his conscious state!) The doctor is well aware that the patient needs an island and would be lost without it. It serves as a refuge for his consciousness and as the last stronghold against the threatening embrace of the unconscious. The same is true of the normal person’s taboo regions which psychology must not touch. But since no war was ever won on the defensive, one must, in order to terminate hostilities, open negotiations with the enemy and see what his terms really are. Such is the intention of the doctor who volunteers to act as a mediator. He is far from wishing to disturb the somewhat precarious island idyll or pull down the fortifications. On the contrary, he is thankful that somewhere a firm foothold exists that does not first have to be fished up out of the chaos, always a desperately difficult task. He knows that the island is a bit cramped and that life on it is pretty meagre and plagued with all sorts of imaginary wants because too much life has been left outside, and that as a result a terrifying monster is created, or rather is roused out of its slumbers. He also knows that this seemingly alarming animal stands in a secret compensatory relationship to the island and could supply everything that the island lacks.

[375] The transference, however, alters the psychological stature of the doctor, though this is at first imperceptible to him. He too becomes affected, and has as much difficulty in distinguishing between the patient and what has taken possession of him as has the patient himself. This leads both of them to a direct confrontation with the daemonic forces lurking in the darkness. The resultant paradoxical blend of positive and negative, of trust and fear, of hope and doubt, of attraction and repulsion, is characteristic of the initial relationship. It is the *veíkos καὶ ψιλία* (hate and love) of the elements, which the alchemists likened to the primeval chaos. The activated unconscious appears as a flurry of unleashed

opposites and calls forth the attempt to reconcile them, so that, in the words of the alchemists, the great panacea, the *medicina catholica,* may be born.

4

[376] It must be emphasized that in alchemy the dark initial state of *nigredo* is often regarded as the product of a previous operation, and that it therefore does not represent the absolute beginning.[26] Similarly, the psychological parallel to the *nigredo* is the result of the foregoing preliminary talk which, at a certain moment, sometimes long delayed, "touches" the unconscious and establishes the unconscious identity[27] of doctor and patient. This moment *may* be perceived and registered consciously, but generally it happens outside consciousness and the bond thus established is recognized only later and indirectly by its results. Occasionally dreams occur about this time, announcing the appearance of the transference. For instance, a dream may say that a fire has started in the cellar, or that a burglar has broken in, or that the patient's father has died, or it may depict an erotic or some other ambiguous situation.[28] From the moment when such a dream occurs there may be initiated a queer unconscious time-reckoning, lasting for months or even longer. I have often observed this process and will give a practical instance of it:

[377] When treating a lady of over sixty, I was struck by the following passage in a dream she had on October 21, 1938: *"A beautiful little child, a girl of six months old, is playing in the kitchen with her grandparents and myself, her mother. The grandparents are on the left of the room and the child stands on the square table in the middle of the kitchen. I stand by the table and play with the child. The old woman says she can hardly believe we have known the child for only six months. I say that it is not so strange because we knew and loved the child long before she was born."*

[378] It is immediately apparent that the child is something special, i.e., a child hero or divine child. The father is not mentioned; his absence is part of the picture.[29] The kitchen, as the scene of the happening, points to the unconscious. The square table is the quaternity, the classical basis of the "special" child,[30] for the child is a symbol of the self and the quaternity is

a symbolical expression of this. The self as such is timeless and existed before any birth.[31] The dreamer was strongly influenced by Indian writings and knew the Upanishads well, but not the medieval Christian symbolism which is in question here. The precise age of the child made me ask the dreamer to look in her notes to see what had happened in the unconscious six months earlier. Under April 20, 1938, she found the following dream:

[379] *"With some other women I am looking at a piece of tapestry, a square with symbolical figures on it. Immediately afterwards I am sitting with some women in front of a marvellous tree. It is magnificently grown, at first it seems to be some kind of conifer, but then I think—in the dream—that it is a monkey-puzzle* [a tree of genus *Araucaria] with the branches growing straight up like candles* [a confusion with *Cereus candelabrum]. A Christmas tree is fitted into it in such a way that at first it looks like one tree instead of two."*—As the dreamer was writing down this dream immediately on waking, with a vivid picture of the tree before her, she suddenly had a vision of a tiny golden child lying at the foot of the tree (tree-birth motif). She had thus gone on dreaming the sense of the dream. It undoubtedly depicts the birth of the divine ("golden") child.

[380] But what had happened nine months previous to April 20, 1938? Between July 19 and 22, 1937, she had painted a picture showing, on the left, a heap of coloured and polished (precious) stones surmounted by a silver serpent, winged and crowned. In the middle of the picture there stands a naked female figure from whose genital region the same serpent rears up towards the heart, where it bursts into a five-pointed, gorgeously flashing golden star. A coloured bird flies down on the right with a little twig in its beak. On the twig five flowers are arranged in a *quaternio,* one yellow, one blue, one red, one green, but the topmost is golden—obviously a mandala structure.[32] The serpent represents the hissing ascent of Kundalini, and in the corresponding yoga this marks the first moment in a process which ends with deification in the divine Self, the syzygy of Shiva and Shakti.[33] It is obviously the moment of symbolical conception, which is both Tantric and—because of the bird—Christian in

character, being a contamination of the symbolism of the Annunciation with Noah's dove and the sprig of olive.

[381] This case, and more particularly the last image, is a classical example of the kind of symbolism which marks the onset of the transference. Noah's dove (the emblem of reconciliation), the *incarnatio Dei*, the union of God with matter for the purpose of begetting the redeemer, the serpent path, the Sushumna representing the line midway between sun and moon—all this is the first, anticipatory stage of an as-yet-unfulfilled programme that culminates in the union of opposites. This union is analogous to the "royal marriage" in alchemy. The prodromal events signify the meeting or collision of various opposites and can therefore appropriately be called chaos and blackness. As mentioned above, this may occur at the beginning of the treatment, or it may have to be preceded by a lengthy analysis, a stage of *rapprochement*. Such is particularly the case when the patient shows violent resistances coupled with fear of the activated contents of the unconscious.[34] There is good reason and ample justification for these resistances and they should never, under any circumstances, be ridden over roughshod or otherwise argued out of existence. Neither should they be belittled, disparaged, or made ridiculous; on the contrary, they should be taken with the utmost seriousness as a vitally important defence mechanism against overpowering contents which are often very difficult to control. The general rule should be that the weakness of the conscious attitude is proportional to the strength of the resistance. When, therefore, there are strong resistances, the conscious rapport with the patient must be carefully watched, and—in certain cases—his conscious attitude must be supported to such a degree that, in view of later developments, one would be bound to charge oneself with the grossest inconsistency. That is inevitable, because one can never be too sure that the weak state of the patient's conscious mind will prove equal to the subsequent assault of the unconscious. In fact, one must go on supporting his conscious (or, as Freud thinks, "repressive") attitude until the patient can let the "repressed" contents rise up spontaneously. Should there by any chance be a latent psychosis[35] which cannot be detected beforehand, this cautious procedure may prevent the devastating invasion of the

unconscious or at least catch it in time. At all events the doctor then has a clear conscience, knowing that he has done everything in his power to avoid a fatal outcome.[36] Nor is it beside the point to add that consistent support of the conscious attitude has in itself a high therapeutic value and not infrequently serves to bring about satisfactory results. It would be a dangerous prejudice to imagine that analysis of the unconscious is the one and only panacea which should therefore be employed in every case. It is rather like a surgical operation and we should only resort to the knife when other methods have failed. So long as it does not obtrude itself the unconscious is best left alone. The reader should be quite clear that my discussion of the transference problem is not an account of the daily routine of the psychotherapist, but far more a description of what happens when the check normally exerted on the unconscious by the conscious mind is disrupted, though this need not necessarily occur at all

[382] Cases where the archetypal problem of the transference becomes acute are by no means always "serious" cases, i.e., grave states of illness. There are of course such cases among them, but there are also mild neuroses, or simply psychological difficulties which we would be at a loss to diagnose. Curiously enough, it is these latter cases that present the doctor with the most difficult problems. Often the persons concerned endure unspeakable suffering without developing any neurotic symptoms that would entitle them to be called ill. We can only call it an intense suffering, a passion of the soul but not a disease of the mind.

5

[383] Once an unconscious content is constellated, it tends to break down the relationship of conscious trust between doctor and patient by creating, through projection, an atmosphere of illusion which either leads to continual misinterpretations and misunderstandings, or else produces a most disconcerting impression of harmony. The latter is even more trying than the former, which at worst (though it is sometimes for the bestl) can only hamper the treatment, whereas in the other case a tremendous effort is needed to discover the points of difference. But in either case the constellation of the unconscious is a troublesome factor. The situation is enveloped in a kind of fog, and this fully accords with the nature of the

unconscious content: it is a “black blacker than black” (nigrum, nigrius nigro),[37] as the alchemists rightly say, and in addition is charged with dangerous polar tensions, with the *inimicitia elementorum*. One finds oneself in an impenetrable chaos, which is indeed one of the synonyms for the mysterious *prima materia*. The latter corresponds to the nature of the unconscious content in every respect, with one exception: this time it does not appear in the alchemical substance but in man himself. In the case of alchemy it is quite evident that the unconscious content is of human origin, as I have shown in *Psychology and Alchemy*.[38] Hunted for centuries and never found, the *prima materia* or *lapis philosophorum* is, as a few alchemists rightly suspected, to be discovered in man himself. But it seems that this content can never be found and integrated directly, but only by the circuitous route of projection. For as a rule the unconscious first appears in projected form. Whenever it appears to obtrude itself directly, as in visions, dreams, illuminations, psychoses, etc., these are always preceded by psychic conditions which give clear proof of projection. A classical example of this is Saul’s fanatical persecution of the Christians before Christ appeared to him in a vision.

[384] The elusive, deceptive, ever-changing content that possesses the patient like a demon now flits about from patient to doctor and, as the third party in the alliance, continues its game, sometimes impish and teasing, sometimes really diabolical. The alchemists aptly personified it as the wily god of revelation, Hermes or Mercurius; and though they lament over the way he hoodwinks them, they still give him the highest names, which bring him very near to deity.[39] But for all that, they deem themselves good Christians whose faithfulness of heart is never in doubt, and they begin and end their treatises with pious invocations.[40] Yet it would be an altogether unjustifiable suppression of the truth were I to confine myself to the negative description of Mercurius’ impish drolleries, his inexhaustible invention, his insinuations, his intriguing ideas and schemes, his ambivalence and—often—his unmistakable malice. He is also capable of the exact opposite, and I can well understand why the alchemists endowed their Mercurius with the highest spiritual qualities, although these stand in flagrant contrast to his exceedingly shady character. The contents of the unconscious are indeed

of the greatest importance, for the unconscious is after all the matrix of the human mind and its inventions. Wonderful and ingenious as this other side of the unconscious is, it can be most dangerously deceptive on account of its numinous nature. Involuntarily one thinks of the devils mentioned by St Athanasius in his life of St Anthony, who talk very piously, sing psalms, read the holy books, and—worst of all—speak the truth. The difficulties of our psychotherapeutic work teach us to take truth, goodness, and beauty where we find them. They are not always found where we look for them: often they are hidden in the dirt or are in the keeping of the dragon. "In stercore invenitur" (it is found in filth)[41] runs an alchemical dictum—nor is it any the less valuable on that account. But, it does not transfigure the dirt and does not diminish the evil, any more than these lessen God's gifts. The contrast is painful and the paradox bewildering. Sayings like are too optimistic and superficial; they forget the moral torment occasioned by the opposites, and the importance of ethical values.

ουρανο ανω	(Heaven above
ουρανο κατω	Heaven below
αστρα ανω	Stars above
αστρα κατω	Stars below
παν ο ανω	All that is above
τουτο κατω	Also is below
ταυτα λαβε	Grasp this
κε ευτυχε	And rejoice) [42]

[385] The refining of the *prima materia*, the unconscious content, demands endless patience, perseverance,[43] equanimity, knowledge, and ability on the part of the doctor; and, on the part of the patient, the putting forth of his best powers and a capacity for suffering which does not leave the doctor altogether unaffected. The deep meaning of the Christian virtues, especially the greatest among these, will become clear even to the unbeliever; for there are times when he needs them all if he is to rescue his consciousness, and his very life, from this pocket of chaos, whose final subjugation, without violence, is no ordinary task. If the work succeeds, it often works like a miracle, and one can understand what it was that prompted the alchemists to insert a heartfelt *Deo concedente* in

their recipes, or to allow that only if God wrought a miracle could their procedure be brought to a successful conclusion.

6

[386] It may seem strange to the reader that a “medical procedure” should give rise to such considerations. Although in illnesses of the body there is no remedy and no treatment that can be said to be infallible in all circumstances, there are still a great many which will probably have the desired effect without either doctor or patient having the slightest need to insert a *Deo concedente*. But we are not dealing here with the body—we are dealing with the psyche. Consequently we cannot speak the language of body-cells and bacteria; we need another language commensurate with the nature of the psyche, and equally we must have an attitude which measures the danger and can meet it. And all this must be genuine or it will have no effect; if it is hollow, it will damage both doctor and patient. The *Deo concedente* is not just a rhetorical flourish; it expresses the firm attitude of the man who does not imagine that he knows better on every occasion and who is fully aware that the unconscious material before him is something *alive*, a paradoxical Mercurius of whom an old master says: “Et est ille quem natura paululum operata est et in metallicam formam formavit, tamen imperfectum relinquit.” (And he is that on whom nature hath worked but a little, and whom she hath wrought into metallic form yet left unfinished)[44]—a natural being, therefore, that longs for integration within the wholeness of a man. It is like a fragment of primeval psyche into which no consciousness has as yet penetrated to create division and order, a “united dual nature,” as Goethe says—an abyss of ambiguities.

[387] Since we cannot imagine—unless we have lost our critical faculties altogether—that mankind today has attained the highest possible degree of consciousness, there must be some potential unconscious psyche left over whose development would result in a further extension and a higher differentiation of consciousness. No one can say how great or small this “remnant” might be, for we have no means of measuring the possible range of conscious development, let alone the extent of the unconscious. But there is not the slightest doubt that a *massa confusa* of archaic and

undifferentiated contents exists, which not only manifests itself in neuroses and psychoses but also forms the "skeleton in the cupboard" of innumerable people who are not really pathological. We are so accustomed to hear that everybody has his "difficulties and problems" that we simply accept it as a banal fact, without considering what these difficulties and problems really mean. Why is one never satisfied with oneself? Why is one unreasonable? Why is one not always good and why must one ever leave a cranny for evil? Why does one sometimes say too much and sometimes too little? Why does one do foolish things which could easily be avoided with a little forethought? What is it that is always frustrating us and thwarting our best intentions? Why are there people who never notice these things and cannot even admit their existence? And finally, why do people in the mass beget the historical lunacy of the last thirty years? Why couldn't Pythagoras, twenty-four hundred years ago, have established the rule of wisdom once and for all, or Christianity have set up the Kingdom of Heaven upon earth?

[388] The Church has the doctrine of the devil, of an evil principle, whom we like to imagine complete with cloven hoofs, horns, and tail, half man, half beast, a chthonic deity apparently escaped from the rout of Dionysus, the sole surviving champion of the sinful joys of paganism. An excellent picture, and one which exactly describes the grotesque and sinister side of the unconscious; for we have never really come to grips with it and consequently it has remained in its original savage state. Probably no one today would still be rash enough to assert that the European is a lamblike creature and not possessed by a devil. The frightful records of our age are plain for all to see, and they surpass in hideousness everything that any previous age, with its feeble instruments, could have hoped to accomplish.

[389] If, as many are fain to believe, the unconscious were only nefarious, only evil, then the situation would be simple and the path clear: to do good and to eschew evil. But what is "good" and what is "evil"? The unconscious is not just evil by nature, it is also the source of the highest good:[45] not only dark but also light, not only bestial, semi-human, and demonic but superhuman, spiritual, and, in the classical sense of the word, "divine." The Mercurius who personifies the unconscious[46] is

essentially "duplex," paradoxically dualistic by nature, fiend, monster, beast, and at the same time panacea, "the philosophers' son," *sapientia Dei*, and *donum Spiritus Sancti*.[47]

[390] Since this is so, all hope of a simple solution is abolished. All definitions of good and evil become suspect or actually invalid. As moral forces, good and evil remain unshaken, and—as the simple verities for which the penal code, the ten commandments, and conventional Christian morality take them—undoubted. But conflicting loyalties are much more subtle and dangerous things, and a conscience sharpened by worldly wisdom can no longer rest content with precepts, ideas, and fine words. When it has to deal with that remnant of primeval psyche, pregnant with the future and yearning for development, it grows uneasy and looks round for some guiding principle or fixed point. Indeed, once this stage has been reached in our dealings with the unconscious, these desiderata become a pressing necessity. Since the only salutary powers visible in the world today are the great psychotherapeutic systems which we call the religions, and from which we expect the soul's salvation, it is quite natural that many people should make the justifiable and often successful attempt to find a niche for themselves in one of the existing creeds and to acquire a deeper insight into the meaning of the traditional saving verities.

[391] This solution is normal and satisfying in that the dogmatically formulated truths of the Christian Church express, almost perfectly, the nature of psychic experience. They are the repositories of the secrets of the soul, and this matchless knowledge is set forth in grand symbolical images. The unconscious thus possesses a natural affinity with the spiritual values of the Church, particularly in their dogmatic form, which owes its special character to centuries of theological controversy—absurd as this seemed in the eyes of later generations—and to the passionate efforts of many great men.

7

[392] The Church would be an ideal solution for anyone seeking a suitable receptacle for the chaos of the unconscious were it not that everything man-made, however refined, has its imperfections. The fact is that a

return to the Church, i.e., to a particular creed, is not the general rule. Much the more frequent is a better understanding of, and a more intense relation to, religion as such, which is not to be confused with a creed.[48] This, it seems to me, is mainly because anyone who appreciates the legitimacy of the two viewpoints, of the two branches into which Christianity has been split, cannot maintain the exclusive validity of either of them, for to do so would be to deceive himself. As a Christian, he has to recognize that the Christendom he belongs to has been split for four hundred years and that his Christian beliefs, far from redeeming him, have exposed him to a conflict and a division that are still rending the body of Christ. These are the facts, and they cannot be abolished by each creed pressing for a decision in its favour, as though each were perfectly sure it possessed the absolute truth. Such an attitude is unfair to modern man; he can see very well the advantages that Protestantism has over Catholicism and *vice versa*, and it is painfully clear to him that this sectarian insistence is trying to corner him against his better judgment—in other words, tempting him to sin against the Holy Ghost. He even understands why the churches are bound to behave in this way, and knows that it must be so lest any joyful Christian should imagine himself already reposing in Abraham's anticipated bosom, saved and at peace and free from all fear. Christ's passion continues—for the life of Christ in the *corpus mysticum*, or Christian life in both camps, is at loggerheads with itself and no honest man can deny the split. We are thus in the precise situation of the neurotic who must put up with the painful realization that he is in the midst of conflict. His repeated efforts to repress the other side have only made his neurosis worse. The doctor must advise him to accept the conflict just as it is, with all the suffering this inevitably entails, otherwise the conflict will never be ended. Intelligent Europeans, if at all interested in such questions, are consciously or semiconsciously protestant Catholics and catholic Protestants, nor are they any the worse for that. It is no use telling me that no such people exist: I have seen both sorts, and they have considerably raised my hopes about the European of the future.

[393] But the negative attitude of the public at large to all credos seems to be less the result of religious convictions than one symptom of the

general mental sloth and ignorance of religion. We can wax indignant over man’s notorious lack of spirituality, but when one is a doctor one does not invariably think that the disease is malevolent or the patient morally inferior; instead, one supposes that the negative results may possibly be due to the remedy applied. Although it may reasonably be doubted whether man has made any marked or even perceptible progress in morality during the known five thousand years of human civilization, it cannot be denied that there has been a notable development of consciousness and its functions. Above all, there has been a tremendous extension of consciousness in the form of *knowledge*. Not only have the individual functions become differentiated, but to a large extent they have been brought under the control of the ego—in other words, man’s will has developed. This is particularly striking when we compare our mentality with that of primitives. The security of our ego has, in comparison with earlier times, greatly increased and has even taken such a dangerous leap forward that, although we sometimes speak of “God’s will,” we no longer know what we are saying, for in the same breath we assert, “Where there’s a will there’s a way.” And who would ever think of appealing to God’s help rather than to the goodwill, the sense of responsibility and duty, the reason or intelligence, of his fellow men?

[394] Whatever we may think of these changes of outlook, we cannot alter the fact of their existence. Now when there is a marked change in the individual’s state of consciousness, the unconscious contents which are thereby constellated will also change. And the further the conscious situation moves away from a certain point of equilibrium, the more forceful and accordingly the more dangerous become the unconscious contents that are struggling to restore the balance. This leads ultimately to a dissociation: on the one hand, ego-consciousness makes convulsive efforts to shake off an invisible opponent (if it does not suspect its next-door neighbour of being the devil!), while on the other hand it increasingly falls victim to the tyrannical will of an internal “Government opposition” which displays all the characteristics of a dæmonic subman and superman combined.

[395] When a few million people get into this state, it produces the sort of situation which has afforded us such an edifying object-lesson every day

for the last ten years. These contemporary events betray their psychological background by their very singularity. The insensate destruction and devastation are a reaction against the deflection of consciousness from the point of equilibrium. For an equilibrium does in fact exist between the psychic ego and non-ego, and that equilibrium is a *religio*, a "careful consideration"[49] of ever-present unconscious forces which we neglect at our peril. The present crisis has been brewing for centuries because of this shift in man's conscious situation.

[396] Have the Churches adapted themselves to this secular change? Their truth may, with more right than we realize, call itself "eternal," but its temporal garment must pay tribute to the evanescence of all earthly things and should take account of psychic changes. Eternal truth needs a human language that alters with the spirit of the times. The primordial images undergo ceaseless transformation and yet remain ever the same, but only in a new form can they be understood anew. Always they require a new interpretation if, as each formulation becomes obsolete, they are not to lose their spellbinding power over that *fugax Mercurius*[50] and allow that useful though dangerous enemy to escape. What is that about "new wine in old bottles"? Where are the answers to the spiritual needs and troubles of a new epoch? And where the knowledge to deal with the psychological problems raised by the development of modern consciousness? Never before has eternal truth been faced with such a hybris of will and power.

8

[397] Here, apart from motives of a more personal nature, probably lie the deeper reasons for the fact that the greater part of Europe has succumbed to neo-paganism and anti-Christianity, and has set up a religious ideal of worldly power in opposition to the metaphysical ideal founded on love. But the individual's decision not to belong to a Church does not necessarily denote an anti-Christian attitude; it may mean exactly the reverse: a reconsidering of the kingdom of God in the human heart where, in the words of St. Augustine,[51] the *mysterium paschale* is accomplished "in its inward and higher meanings." The ancient and long obsolete idea of man as a microcosm contains a supreme psychological

truth that has yet to be discovered. In former times this truth was projected upon the body, just as alchemy projected the unconscious psyche upon chemical substances. But it is altogether different when the microcosm is understood as that interior world whose inward nature is fleetingly glimpsed in the unconscious. An inkling of this is to be found in the words of Origen: “Intellige te alium mundum esse in parvo et esse intra te Solem, esse Lunam, esse etiam stellas” (Understand that thou art a second little world and that the sun and the moon are within thee, and also the stars).[52] And just as the cosmos is not a dissolving mass of particles, but rests in the unity of God’s embrace, so man must not dissolve into a whirl of warring possibilities and tendencies imposed on him by the unconscious, but must become the unity that embraces them all. Origen says pertinently: “Vides, quomodo ille, qui putatur unus esse, non est unus, sed tot in eo personae videntur esse, quot mores” (Thou seest that he who seemeth to be one is yet not one, but as many persons appear in him as he hath velleities).[53] Possession by the unconscious means being torn apart into many people and things, a *disiunctio*. That is why, according to Origen, the aim of the Christian is to become an inwardly united human being.[54] The blind insistence on the outward community of the Church naturally fails to fulfil this aim; on the contrary, it inadvertently provides the inner disunity with an outward vessel without really changing the *disiunctio* into a *coniunctio*.

[398] The painful conflict that begins with the *nigredo* or *tenebrositas* is described by the alchemists as the *separatio* or *divisio elementorum*, the *solutio*, *calcinatio*, *incineratio*, or as dismemberment of the body, excruciating animal sacrifices, amputation of the mother’s hands or the lion’s paws, atomization of the bridegroom in the body of the bride, and so on.[55] While this extreme form of *disiunctio* is going on, there is a transformation of that arcanum—be it substance or spirit—which invariably turns out to be the mysterious Mercurius. In other words, out of the monstrous animal forms there gradually emerges a *res simplex*, whose nature is one and the same and yet consists of a duality (Goethe’s “united dual nature”). The alchemist tries to get round this paradox or antinomy with his various procedures and formulae, and to make one out of two.[56] But the very multiplicity of his symbols and symbolic processes

proves that success is doubtful. Seldom do we find symbols of the goal whose dual nature is not immediately apparent. His *filius philosophorum*, his *lapis*, his *rebis*, his homunculus, are all hermaphroditic. His gold is *non vulgi*, his *lapis* is spirit and body, and so is his tincture, which is a *sanguis spiritualis—a* spiritual blood.[57] We can therefore understand why the *nuptiae chymicae*, the royal marriage, occupies such an important place in alchemy as a symbol of the supreme and ultimate union, since it represents the magic-by-analogy which is supposed to bring the work to its final consummation and bind the opposites by love, for "love is stronger than death."

9

[399] Alchemy describes, not merely in general outline but often in the most astonishing detail, the same psychological phenomenology which can be observed in the analysis of unconscious processes. The individual's specious unity that emphatically says "*I* want, *I* think" breaks down under the impact of the unconscious. So long as the patient can think that somebody else (his father or mother) is responsible for his difficulties, he can save some semblance of unity (*putatur unus esse!*). But once he realizes that he himself has a shadow, that his enemy is in his own heart, then the conflict begins and one becomes two. Since the "other" will eventually prove to be yet another duality, a compound of opposites, the ego soon becomes a shuttlecock tossed between a multitude of "velleities," with the result that there is an "obfuscation of the light," i.e., consciousness is depotentiated and the patient is at a loss to know where his personality begins or ends. It is like passing through the valley of the shadow, and sometimes the patient has to cling to the doctor as the last remaining shred of reality. This situation is difficult and distressing for both parties; often the doctor is in much the same position as the alchemist who no longer knew whether he was melting the mysterious amalgam in the crucible or whether he was the salamander glowing in the fire. Psychological induction inevitably causes the two parties to get involved in the transformation of the third and to be themselves transformed in the process, and all the time the doctor's knowledge, like a flickering lamp, is the one dim light in the darkness. Nothing gives a better picture of the psychological state of the alchemist

than the division of his work-room into a “laboratory,” where he bustles about with crucibles and alembics, and an “oratory,” where he prays to God for the much needed illumination—”purge the horrible darknesses of our mind,”[58] as the author of *Aurora* quotes.

[400] “Ars requirit totum hominem,” we read in an old treatise.[59] This is in the highest degree true of psychotherapeutic work. A genuine participation, going right beyond professional routine, is absolutely imperative, unless of course the doctor prefers to jeopardize the whole proceeding by evading his own problems, which are becoming more and more insistent. The doctor must go to the limits of his subjective possibilities, otherwise the patient will be unable to follow suit. Arbitrary limits are no use, only real ones. It must be a genuine process of purification where “all superfluities are consumed in the fire” and the basic facts emerge. Is there anything more fundamental than the realization, “This is what I am”? It reveals a unity which nevertheless is —or was—a diversity. No longer the earlier ego with its make-believes and artificial contrivances, but another, “objective” ego, which for this reason is better called the “self.” No longer a mere selection of suitable fictions, but a string of hard facts, which together make up the cross we all have to carry or the fate we ourselves are. These first indications of a future synthesis of personality, as I have shown in my earlier publications, appear in dreams or in “active imagination,” where they take the form of the mandala symbols which were also not unknown in alchemy. But the first signs of this symbolism are far from indicating that unity has been attained. Just as alchemy has a great many very different procedures, ranging from the sevenfold to the thousandfold distillation, or from the “work of one day” to “the errant quest” lasting for decades, so the tensions between the psychic pairs of opposites ease off only gradually; and, like the alchemical end-product, which always betrays its essential duality, the united personality will never quite lose the painful sense of innate discord. Complete redemption from the sufferings of this world is and must remain an illusion. Christ’s earthly life likewise ended, not in complacent bliss, but on the cross. (It is a remarkable fact that in their hedonistic aims materialism and a certain species of “joyful” Christianity join hands like brothers.) The goal is important only as an

idea; the essential thing is the *opus* which leads to the goal: *that* is the goal of a lifetime. In its attainment “left and right”[60] are united, and conscious and unconscious work in harmony.

10

[401] The *coniunctio oppositorum* in the guise of Sol and Luna, the royal brother-sister or mother-son pair, occupies such an important place in alchemy that sometimes the entire process takes the form of the *hierosgamos* and its mystic consequences. The most complete and the simplest illustration of this is perhaps the series of pictures contained in the *Rosarium philosophorum* of 1550, which series I reproduce in what follows. Its psychological importance justifies closer examination. Everything that the doctor discovers and experiences when analysing the unconscious of his patient coincides in the most remarkable way with the content of these pictures. This is not likely to be mere chance, because the old alchemists were often doctors as well, and thus had ample opportunity for such experiences if, like Paracelsus, they worried about the psychological well-being of their patients or inquired into their dreams (for the purpose of diagnosis, prognosis, and therapy). In this way they could collect information of a psychological nature, not only from their patients but also from themselves, i.e., from the observation of their own unconscious contents which had been activated by induction.[61] Just as the unconscious expresses itself even today in a picture-series, often drawn spontaneously by the patient, so those earlier pictures, such as we find in the Codex Rhenoviensis 172, in Zurich, and in other treatises, were no doubt produced in a similar way, that is, as the deposit of impressions collected during the work and then interpreted or modified in the light of traditional factors.[62] In the modern pictures, too, we find not a few traces of traditional themes side by side with spontaneous repetitions of archaic or mythological ideas. In view of this close connection between picture and psychic content, it does not seem to me out of place to examine a medieval series of pictures in the light of modern discoveries, or even to use them as an Ariadne thread in our account of the latter. These curiosities of the Middle Ages contain the seeds of much that emerged in clearer form only many centuries later.

THE MERCURIAL FOUNTAIN

We are the metals’ first nature and only source/
The highest tincture of the Art is made through us.
No fountain and no water has my like/
I make both rich and poor both whole and sick.
For healthful can I be and poisonous.[1]

[*Figure 1*]

[402] This picture goes straight to the heart of alchemical symbolism, for it is an attempt to depict the mysterious basis of the *opus*. It is a quadratic quaternity characterized by the four stars in the four corners. These are the four elements. Above, in the centre, there is a fifth star which represents the fifth entity, the “One” derived from the four, the *quinta essentia*. The basin below is the *vas Hermeticum*, where the transformation takes place. It contains the *mare nostrum*, the *aqua permanens* or ὕδωρ θεῖον, the “divine water.” This is the *mare tenebrosum*, the chaos. The vessel is also called the uterus[2] in which the *foetus spagyricus* (the homunculus) is gestated.[3] This basin, in contrast to the surrounding square, is circular, because it *is* the matrix of the perfect form into which the square, as an imperfect form, must be changed. In the square the elements are still separate and hostile to one another and must therefore be united in the circle. The inscription on the rim of the basin bears out this intention. It runs (filling in the abbreviations): “Unus est Mercurius mineralis, Mercurius vegetabilis, Mercurius animalis.” (*Vegetabilis* should be translated as “living” and *animalis* as “animate” in the sense of having a soul, or even as “psychic.”[4]) On the outside of the basin there are six stars which together with Mercurius represent the seven planets or metals. They are all as it were contained in Mercurius, since he is the *pater metallorum*. When personified, he is the unity of the seven planets, an Anthropos whose body is the world, like Gayomart, from whose body the seven metals flow into the earth. Owing to his

feminine nature, Mercurius is also the mother of the seven, and not only of the six, for he is his own father and mother.[5]

[403] Out of the "sea," then, there rises this Mercurial Fountain, *triplex nomine*, as is said with reference to the three manifestations of Mercurius.[6] He is shown flowing out of three pipes in the form of *lac virginis*, *acetum fontis*, and *aqua vitae*. These are three of his innumerable synonyms. The aforementioned unity of Mercurius is here represented as a triad. It is repeatedly emphasized that he is a trinity, *triunus* or *trinus*, the chthonic, lower, or even infernal counterpart of the Heavenly Trinity, just as Dante's devil is three-headed.[7] For the same reason Mercurius is often shown as a three-headed serpent. Above the three pipes we find the sun and moon, who are the indispensable acolytes and parents of the mystic transformation, and, a little higher, the quintessential star, symbol of the unity of the four hostile elements. At the top of the picture is the *serpens bifidus*, the divided (or two-headed) serpent, the fatal *binarius* which Dorn defines as the devil.[8] This serpent is the *serpens mercurialis*,[9] representing the *duplex natura* of Mercurius. The heads are spitting forth fire, from which Maria the Copt or Jewess derived her "duo fumi."[10] These are the two vapours whose condensation[11] initiates the process which leads to a multiple sublimation or distillation for the purpose of purifying away the *mali odores*, the *foetor sepulcrorum*[12] and the clinging darkness of the beginning.

Figure 1

[404] This structure reveals the tetrameria (fourfold nature) of the transforming process, already known to the Greeks. It begins with the four separate elements, the state of chaos, and ascends by degrees to the three manifestations of Mercurius in the inorganic, organic, and spiritual worlds; and, after attaining the form of Sol and Luna (i.e., the precious metals gold and silver, but also the radiance of the gods who can overcome the strife of the elements by love), it culminates in the one and indivisible (incorruptible, ethereal, eternal) nature of the *anima*, the *quinta essentia, aqua permanens*, tincture, or *lapis philosophorum*. This progression from the number 4 to 3 to 2 to 1 is the "axiom of Maria," which runs in various forms through the whole of alchemy like a *leitmotiv*. If we set aside the numerous "chemical" explanations we come

to the following symbolical ground-plan: the initial state of wholeness is marked by four mutually antagonistic tendencies—4 being the minimum number by which a circle can be naturally and visibly defined. The reduction of this number aims at final unity. The first to appear in the progression is the number 3, a masculine number, and out of it comes the feminine number 2.[13] Male and female inevitably constellate the idea of sexual union as the means of producing the 1, which is then consistently called the *filius regius* or *filius philosophorum*.

[405] The quaternity[14] is one of the most widespread archetypes and has also proved to be one of the most useful schemata for representing the arrangement of the functions by which the conscious mind takes its bearings.[15] It is like the crossed threads in the telescope of our understanding. The cross formed by the points of the quaternity is no less universal and has in addition the highest possible moral and religious significance for Western man. Similarly the circle, as the symbol of completeness and perfect being, is a widespread expression for heaven, sun, and God; it also expresses the primordial image of man and the soul.[16] Four as the minimal number by which order can be created represents the pluralistic state of the man who has not yet attained inner unity, hence the state of bondage and disunion, of disintegration, and of being torn in different directions—an agonizing, unredeemed state which longs for union, reconciliation, redemption, healing, and wholeness.

[406] The triad appears as "masculine," i.e., as the active resolve or *agens* whose alchemical equivalent is the "upwelling." In relation to it the dyad is "feminine," the receptive, absorbent *patiens*, or the material that still has to be formed and impregnated (*informatio*, *impraegnatio*). The psychological equivalent of the triad is want, desire, instinct, aggression and determination, whereas the dyad corresponds to the reaction of the psychic system as a whole to the impulse or decision of the conscious mind. This would of course perish of inanition if it did not succeed in overcoming the inertia of the merely natural man and in achieving its object despite his laziness and constant resistance. But by dint of compulsion or persuasion the conscious mind is able to carry through its purpose, and only in the resultant *action* is a man a living whole and a

unity ("In the beginning was the deed," as Faust says)[17]—provided that the action is the mature product of a process embracing the whole psyche and not just a spasm or impulse that has the effect of suppressing it.

[407] At bottom, therefore, our symbolical picture is an illustration of the methods and philosophy of alchemy. These are not warranted by the nature of matter as known to the old masters; they can only derive from the *unconscious* psyche. No doubt there was also a certain amount of *conscious* speculation among the alchemists, but this is no hindrance whatever to unconscious projection, for wherever the mind of the investigator departs from exact observation of the facts before it and goes its own way, the unconscious *spiritus rector* will take over and lead the mind back to the unchangeable, underlying archetypes, which are then forced into projection by this regression. We are moving here on familiar ground. These things are depicted in the most magnificent images in the last and greatest work of alchemy—Goethe's *Faust*. Goethe is really describing the experience of the alchemist who discovers that what he has projected into the retort is his own darkness, his unredeemed state, his passion, his struggles to reach the goal, i.e., to become what he really is, to fulfil the purpose for which his mother bore him, and, after the peregrinations of a long life full of confusion and error, to become the *filius regius*, son of the supreme mother. Or we can go even further back to the important forerunner of *Faust*, the *Chymical Wedding* of Christian Rosencreutz (1616), which was assuredly known to Goethe.[18] Fundamentally it is the same theme, the same "Axioma Mariae," telling how Rosencreutz is transformed out of his former unenlightened condition and comes to realize that he is related to "royalty." But in keeping with its period (beginning of the seventeenth century), the whole process is far more projected and the withdrawal of the projection into the hero—which in Faust's case turns him into a superman[19]—is only fleetingly hinted at. Yet the psychological process is essentially the same: the becoming aware of those powerful contents which alchemy sensed in the secrets of matter.

[408] The text that follows the picture of the Mercurial Fountain is mainly concerned with the "water" of the art, i.e., mercury. In order to avoid

repetition, I would refer the reader to my lecture "The Spirit Mercurius." Here I will only say that this fluid substance, with all its paradoxical qualities, really signifies the unconscious which has been projected into it. The "sea" is its static condition, the "fountain" its activation, and the "process" its transformation. The integration of unconscious contents is expressed in the idea of the elixir, the *medicina catholica* or *universalis* the *aurum potabile*, the *cibus sempiternus* (everlasting food), the health-giving fruits of the philosophical tree, the *vinum ardens*, and all the other innumerable synonyms. Some of them are decidedly ominous but no less characteristic, such as *succus lunariae* or *lunatica* (juice of the moon-plant),[20] *aqua Saturni* (note that Saturn is a baleful deity!), poison, scorpion, dragon, son of the fire, boys' or dogs' urine, brimstone, devil, etc.

[409] Although not expressly stated in the text, the gushing up and flowing back of the Mercurial Fountain within its basin completes a circle, and this is an essential characteristic of Mercurius because he is also the serpent that fertilizes, kills, and devours itself and brings itself to birth again. We may mention in this connection that the circular sea with no outlet, which perpetually replenishes itself by means of a spring bubbling up in its centre, is to be found in Nicholas of Cusa as an allegory of God.[21]

2

KING AND QUEEN

[410] The *arcanum artis*, or *coniunctio Solis et Lunae* as supreme union of hostile opposites, was not shown in our first picture; but now it is illustrated in considerable detail, as its importance deserves, in a series of pictures. King and Queen, bridegroom and bride, approach one another for the purpose of betrothal or marriage. The incest element appears in the brother-sister relationship of Apollo and Diana. The pair of them stand respectively on sun and moon, thus indicating their solar and lunar nature in accordance with the astrological assumption of the importance of the sun's position for man and the moon's for woman. The meeting is somewhat distant at first, as the court clothes suggest. The two give each other their *left* hands, and this can hardly be unintentional since it is contrary to custom. The gesture points to a closely guarded secret, to the "left-hand path," as the Indian Tantrists call their Shiva and Shakti worship. The left-hand (sinister) side is the dark, the unconscious side. The left is inauspicious and awkward; also it is the side of the heart, from which comes not only love but all the evil thoughts connected with it, the moral contradictions in human nature that are expressed most clearly in our affective life. The contact of left hands could therefore be taken as an indication of the affective nature of the relationship, of its dubious character, since this is a mixture of "heavenly and earthly" love further complicated by an incestuous *sous-entendu*. In this delicate yet altogether human situation the gesture of the *right* hands strikes us as compensatory. They are holding a device composed of five (4 + 1) flowers. The branches in the hands each have two flowers; these four again refer to the four elements of which two—fire and air—are active and two—water and earth—passive, the former being ascribed to the man and the latter to the woman. The fifth flower comes from above and presumably represents the *quinta essentia;* it is brought by the dove of the Holy Ghost, an analogy of Noah's dove that carried the olive branch of

reconciliation in its beak. The bird descends from the quintessential star (cf. fig. 1).

[411] The real secret lies in the union of *right* hands, for, as the picture shows, this is mediated by the *donum Spiritus Sancti*, the royal art. The “sinister” left-handed contact here becomes associated with the union, effected from above, of two quaternities (the masculine and feminine manifestations of the four elements) in the form of an ogdoad consisting of five flowers and three branches. These masculine numbers point to action, decision, purpose, and movement. The fifth flower is distinguished from the four in that it is brought by the dove. The three branches correspond to the upwelling of Mercurius *triplex nomine* or to the three pipes of the fountain. So once again we have an abbreviated recapitulation of the *opus*, i.e., of its deeper meaning as shown in the first picture. The text to Figure 2 begins significantly with the words: “Mark well, in the art of our magisterium nothing is concealed by the philosophers except the secret of the art which may not be revealed to all and sundry. For were that to happen, that man would be accursed; he would incur the wrath of God and perish of the apoplexy. Wherefore all error in the art arises because men do not begin with the proper substance,[1] and for this reason you should employ venerable Nature, because from her and through her and in her is our art born and in naught else: and so our magisterium is the work of Nature and not of the worker.”[2]

[412] If we take the fear of divine punishment for betrayal at its face value, the reason for this must lie in something that is thought to endanger the soul’s salvation, i.e., a typical “peril of the soul.” The causal “wherefore” with which the next sentence begins can only refer to the secret that must not be revealed; but because the *prima materia* remains unknown in consequence, all those who do not know the secret fall into error, and this happens because, as said, they choose something arbitrary and artificial instead of pure Nature. The emphasis laid on *venerabilis natura*[3] gives us some idea of that passion for investigation which ultimately gave birth to natural science, but which so often proved inimical to faith. Worship of nature, a legacy from the past, stood in more or less secret opposition to

the views of the Church and led the mind and heart in the direction of a “left-hand path.” What a sensation Petrarch’s ascent of Mont Ventoux caused! St. Augustine had warned in his *Confessions* (X, viii): “And men go forth to admire the high mountains and the great waves of the sea and the broad torrent of the rivers and the vast expanse of the ocean and the orbits of the stars, and to turn away from themselves.…”

PHILOSOPHORVM.

Nota bene: In arte noſtri magiſterij nihil eſt celatũ à Philoſophis excepto ſecreto artis, quod non licet cuiquam reuelare, quod ſi fieret ille malediceretur, & indignationem domini incurreret, & apoplexia moreretur. Quare omnis error in arte exiſtit, ex eo, quod debitam

Secretum artis

C ij

Figure 2

[413] The exclusive emphasis on nature as the one and only basis of the art is in flagrant contrast to the ever-recurring protestation that the art is a *donum Spiritus Sancti*, an arcanum of the *sapientia Dei*, and so forth, from which we would have to conclude that the alchemists were

unshakably orthodox in their beliefs. I do not think that this can be doubted as a rule. On the contrary, their belief in illumination through the Holy Ghost seems to have been a psychological necessity in view of the ominous darkness of nature's secrets.

[414] Now if a text which insists so much on pure nature is explained or illustrated by a picture like Figure 2, we must assume that the relationship between king and queen was taken to be something perfectly natural. Meditation and speculation about the mystery of the *coniunctio* were inevitable, and this would certainly not leave erotic fantasy untouched, if only because these symbolical pictures spring from the corresponding unconscious contents—half spiritual, half sexual—and are also intended to remind us of that twilit region, for only from indistinguishable night can the light be born. This is what nature and natural experience teach, but the spirit believes in the *lumen de lumine*—the light born of light.[4] Somehow the artifex was entangled in this game of unconscious projection and was bound to experience the mysterious happening with shudders of fear, as a tremendum. Even that scoffer and blasphemer Agrippa von Nettesheim displays a remarkable reticence in his criticism of "Alkumistica."[5] After saying a great deal about this dubious art, he adds:[6] "Permulta adhuc de hoc arte (mihi tamen non ad modum inimica) dicere possem, nisi iuratum esset (quod facere solent, qui mysteriis initiantur) de silentio"(I could say much more about this art—which I do not find so disagreeable—were it not for the oath of silence usually taken by initiates into mysteries).[7] Such a mitigation of his criticism, most unexpected in Agrippa, makes one think that he is on the defensive: somehow he was impressed by the royal art.

[415] It is not necessary to think of the secret of the art as anything very lurid. Nature knows nothing of moral squalor, indeed her truths are alarming enough. We need only bear in mind one fact: that the desired *coniunctio* was not a legitimate union but was always—one could almost say, on principleincestuous. The fear that surrounds this complex—the "fear of incest"—is quite typical and has already been stressed by Freud. It is further exacerbated by fear of the compulsive force which emanates from most unconscious contents.

[416] The left-handed contact and crosswise union of the right hands—*sub rosa*— is a startlingly concrete and yet very subtle hint of the delicate situation in which “venerable nature” has placed the adept. Although the Rosicrucian movement cannot be traced further back than the *Fama* and *Confessio fraternitatis* of Andreae at the beginning of the seventeenth century,[8] we are nevertheless confronted with a “rosie cross” in this curious bouquet of three flowering branches, which evidently originated sometime before 1550 but, equally obviously, makes no claim to be a true *rosicrux*.[9] As we have already said, its threefold structure is reminiscent of the Mercurial Fountain, while at the same time it points to the important fact that the “rose” is the product of three *living* things: the king, the queen, and between them the dove of the Holy Ghost. Mercurius *triplex nomine* is thus converted into three figures, and he can no longer be thought of as a metal or mineral, but only as “spirit.” In this form also he is triple-natured—masculine, feminine, and divine. His coincidence with the Holy Ghost as the third person of the Trinity certainly has no foundation in dogma, but “venerable nature” evidently enabled the alchemist to provide the Holy Ghost with a most unorthodox and distinctly earth-bound partner, or rather to complement him with that divine spirit which had been imprisoned in all creatures since the day of Creation. This “lower” spirit is the Primordial Man, hermaphroditic by nature and of Iranian origin, who was imprisoned in Physis.[10] He is the spherical, i.e., perfect, man who appears at the beginning and end of time and is man’s own beginning and end. He is man’s totality, which is beyond the division of the sexes and can only be reached when male and female come together in one. The revelation of this higher meaning solves the problems created by the “sinister” contact and produces from the chaotic darkness the *lumen quod superat omnia lumina*.

[417] If I did not know from ample experience that such developments also occur in modern man, who cannot possibly be suspected of having any knowledge of the Gnostic doctrine of the Anthropos, I should be inclined to think that the alchemists were keeping up a secret tradition, although the evidence for this (the hints contained in the writings of Zosimos of Panopolis) is so scanty that Waite, who knows medieval alchemy relatively well, doubts whether a secret tradition existed at all.[11] I am

therefore of the opinion, based on my professional work, that the Anthropos idea in medieval alchemy was largely “autochthonous,” i.e., the outcome of subjective experience. It is an “eternal” idea, an archetype that can appear spontaneously at any time and in any place. We meet the Anthropos even in ancient Chinese alchemy, in the writings of Wei Po-yang, about A.D. 142. There he is called *chên-jên* (‘true man’).[12]

[418] The revelation of the Anthropos is associated with no ordinary religious emotion; it signifies much the same thing as the vision of Christ for the believing Christian. Nevertheless it does not appear *ex opere divino* but *ex opere naturae;* not from above but from the transformation of a shade from Hades, akin to evil itself and bearing the name of the pagan god of revelation. This dilemma throws a new light on the secret of the art: the very serious danger of heresy. Consequently the alchemists found themselves between Scylla and Charybdis: on the one hand they ran the conscious risk of being misunderstood and suspected of fraudulent gold-making, and on the other of being burned at the stake as heretics. As to the gold, right at the beginning of the text to Figure 2, the *Rosarium* quotes the words of Senior: “Aurum nostrum non est aurum vulgi.” But, as history shows, the alchemist would rather risk being suspected of gold-making than of heresy. It is still an open question, which perhaps can never be answered, how far the alchemist was conscious of the true nature of his art. Even texts as revealing as the *Rosarium* and *Aurora consurgens* do not help us in this respect.

[419] As regards the psychology of this picture, we must stress above all else that it depicts a human encounter where love plays the decisive part. The conventional dress of the pair suggests an equally conventional attitude in both of them. Convention still separates them and hides their natural reality, but the crucial contact of left hands points to something “sinister,” illegitimate, morganatic, emotional, and instinctive, i.e., the fatal touch of incest and its “perverse” fascination. At the same time the intervention of the Holy Ghost reveals the hidden meaning of the incest, whether of brother and sister or of mother and son, as a repulsive symbol for the *unio mystica*. Although the union of close blood-relatives is everywhere taboo, it is yet the prerogative of kings (witness the incestuous marriages of the Pharaohs, etc.). Incest symbolizes union with

one's own being, it means individuation or becoming a self, and, because this is so vitally important, it exerts an unholy fascination—not, perhaps, as a crude reality, but certainly as a psychic process controlled by the unconscious, a fact well known to anybody who is familiar with psychopathology. It is for this reason, and not because of occasional cases of human incest, that the first gods were believed to propagate their kind incestuously. Incest is simply the union of like with like, which is the next stage in the development of the primitive idea of self-fertilization.[13]

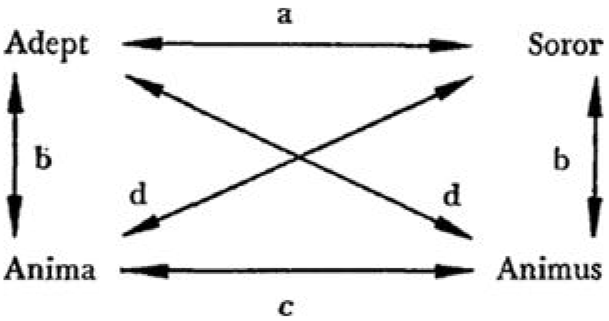
[420] This psychological situation sums up what we can all see for ourselves if we analyse a transference carefully. The conventional meeting is followed by an unconscious "familiarization" of one's partner, brought about by the projection of archaic, infantile fantasies which were originally vested in members of the patient's own family and which, because of their positive or negative fascination, attach him to parents, brothers, and sisters.[14] The transference of these fantasies to the doctor draws him into the atmosphere of family intimacy, and although this is the last thing he wants, it nevertheless provides a workable *prima materia*. Once the transference has appeared, the doctor must accept it as part of the treatment and try to understand it, otherwise it will be just another piece of neurotic stupidity. The transference itself is a perfectly natural phenomenon which does not by any means happen only in the consulting-room—it can be seen everywhere and may lead to all sorts of nonsense, like all unrecognized projections. Medical treatment of the transference gives the patient a priceless opportunity to withdraw his projections, to make good his losses, and to integrate his personality. The impulses underlying it certainly show their dark side to begin with, however much one may try to whitewash them; for an integral part of the work is the *umbra solis* or *sol niger* of the alchemists, the black shadow which everybody carries with him, the inferior and therefore hidden aspect of the personality, the weakness that goes with every strength, the night that follows every day, the evil in the good.[15] The realization of this fact is naturally coupled with the danger of falling victim to the shadow, but the danger also brings with it the possibility of consciously deciding not to become its victim. A visible enemy is always better than an

invisible one. In this case I can see no advantage whatever in behaving like an ostrich. It is certainly no ideal for people always to remain childish, to live in a perpetual state of delusion about themselves, foisting everything they dislike on to their neighbours and plaguing them with their prejudices and projections. How many marriages are wrecked for years, and sometimes forever, because he sees his mother in his wife and she her father in her husband, and neither ever recognizes the other's reality! Life has difficulties enough without that; we might at least spare ourselves the stupidest of them. But, without a fundamental discussion of the situation, it is often simply impossible to break these infantile projections. As this is the legitimate aim and real meaning of the transference, it inevitably leads, whatever method of rapprochement be used, to discussion and understanding and hence to a heightened consciousness, which is a measure of the personality's integration. During this discussion the conventional disguises are dropped and the true man comes to light. He is in very truth reborn from this psychological relationship, and his field of consciousness is rounded into a circle.

[421] It would be quite natural to suppose that the king and queen represent a transference relationship in which the king stands for the masculine partner and the queen for the feminine partner. But this is by no means the case, because the figures represent contents which have been projected from the unconscious of the adept (and his *soror mystica*). Now the adept is conscious of himself as a man, consequently his masculinity cannot be projected, since this only happens to unconscious contents. As it is primarily a question of man and woman here, the projected fragment of personality can only be the feminine component of the man, i.e., his anima.[16] Similarly, in the woman's case, only the masculine component can be projected. There is thus a curious counter-crossing of the sexes: the man (in this case the adept) is represented by the queen, and the woman (the *soror mystica*) by the king. It seems to me that the flowers forming the "symbol" suggest this counter-crossing. The reader should therefore bear in mind that the picture shows two archetypal figures meeting, and that Luna is secretly in league with the adept, and Sol with his woman helper. The fact that the figures are royal expresses, like real

royalty, their archetypal character; they are collective figures common to large numbers of people. If the main ingredient of this mystery were the enthronement of a king or the deification of a mortal, then the figure of the king might possibly be a projection and would in that case correspond to the adept. But the subsequent development of the drama has quite another meaning, so we can discount this possibility.[17]

[422] The fact that, for reasons which can be proved empirically, king and queen play cross roles and represent the unconscious contra-sexual side of the adept and his soror leads to a painful complication which by no means simplifies the problem of transference. Scientific integrity, however, forbids all simplification of situations that are not simple, as is obviously the case here. The pattern of relationship is simple enough, but, when it comes to detailed description in any given case, it is extremely difficult to make out from which angle the relationship is being described and what aspect we are describing. The pattern is as follows:



[423] The direction of the arrows indicates the pull from masculine to feminine and *vice versa*, and from the unconscious of one person to the conscious of the other, thus denoting a positive transference relationship. The following relationships have therefore to be distinguished, although in certain cases they can all merge into each other, and this naturally leads to the greatest possible confusion:

(a) An uncomplicated personal relationship.

(b) A relationship of the man to his anima and of the woman to her animus.

(c) A relationship of anima to animus and *vice versa*.

(d) A relationship of the woman’s animus to the man (which happens when the woman is identical with her animus), and of the man’s anima to the woman (which happens when the man is identical with his anima).

[424] In describing the transference problem with the help of this series of illustrations, I have not always kept these different possibilities apart; for in real life they are invariably mixed up and it would have put an intolerable strain on the explanation had I attempted a rigidly schematic exposition. Thus the king and queen each display every conceivable shade of meaning from the superhuman to the subhuman, sometimes appearing as a transcendental figure, sometimes hiding in the figure of the adept. The reader should bear this in mind if he comes across any real or supposed contradictions in the remarks which follow.

[425] These counter-crossing transference relationships are foreshadowed in folklore: the archetype of the cross-marriage, which I call the “marriage quaternio,”[18] can also be found in fairytales. An Icelandic fairytale[19] tells the following story:

[426] Finna was a girl with mysterious powers. One day, when her father was setting out for the Althing, she begged him to refuse any suitor who might ask for her hand. There were many suitors present, but the father refused them all. On the way home he met a strange man, Geir by name, who forced the father at point of sword to promise his daughter to him. So they were married, and Finna took Sigurd her brother with her to her new home. About Christmas-time, when Finna was busy with the festive preparations, Geir disappeared. Finna and her brother went out to look for him and found him on an island with a beautiful woman. After Christmas, Geir suddenly appeared in Finna’s bedroom. In the bed lay a child. Geir asked her whose child it was, and Finna answered that it was her child. And so it happened for three years in succession, and each time Finna accepted the child. But at the third time, Geir was released from his spell. The beautiful woman on the island was Ingeborg, his sister. Geir had disobeyed his stepmother, a witch, and she had laid a curse on him: he was to have three children by his sister, and unless he found a wife who knew everything and held her peace, he would be changed into a

snake and his sister into a filly. Geir was saved by the conduct of his wife; and he married his sister Ingeborg to Sigurd.

[427] Another example is the Russian fairytale “Prince Danila Govorila.”[20] There is a young prince who is given a lucky ring by a witch. But its magic will work only on one condition: he must marry none but the girl whose finger the ring fits. When he grows up he goes in search of a bride, but all in vain, because the ring fits none of them. So he laments his fate to his sister, who asks to try on the ring. It fits perfectly. Thereupon her brother wants to marry her, but she thinks it would be a sin and sits at the door of the house weeping. Some old beggars who are passing comfort her and give her the following advice: “Make four dolls and put them in the four corners of the room. If your brother summons you to the wedding, go, but if he summons you to the bedchamber, do not hurry! Trust in God and follow our advice.”

[428] After the wedding her brother summons her to bed. Then the four dolls begin to sing:

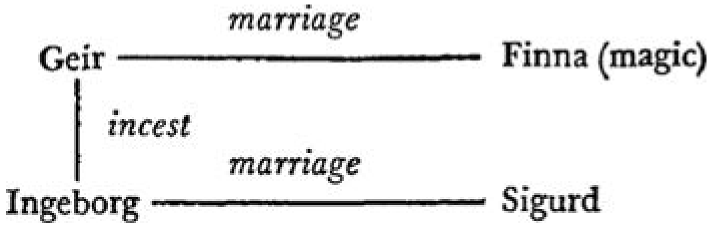
Cuckoo, Prince Danila,
Cuckoo, Govorila,
Cuckoo, he takes his sister,
Cuckoo, for a wife,
Cuckoo, earth open wide,
Cuckoo, sister fall inside.

[429] The earth opens and swallows her up. Her brother calls her three times, but by the third time she has already vanished. She goes along under the earth until she comes to the hut of Baba Yaga,[21] whose daughter kindly shelters her and hides her from the witch. But before long the witch discovers her and heats up the oven. The two girls then seize the old woman and put her in the oven instead, thus escaping the witch’s persecution. They reach the prince’s castle, where the sister is recognized by her brother’s servant. But her brother cannot tell the two girls apart, they are so alike. So the servant advises him to make a test: the prince is to fill a skin with blood and put it under his arm. The servant will then stab him in the side with a knife and the prince is to fall down as if dead. The sister will then surely betray herself. And so it happens: the sister throws herself upon him with a great cry, whereupon the prince

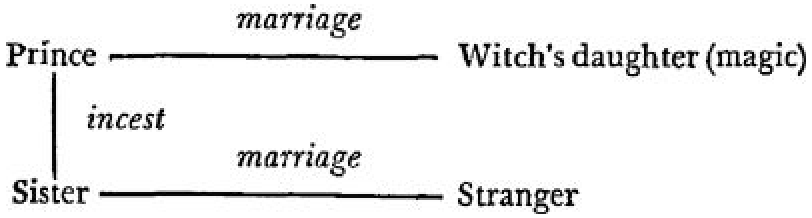
springs up and embraces her. But the magic ring also fits the finger of the witch’s daughter, so the prince marries her and gives his sister to a suitable husband.

[430] In this tale the incest is on the point of being committed, but is prevented by the peculiar ritual with the four dolls. The four dolls in the four corners of the room form the marriage quaternio, the aim being to prevent the incest by putting four in place of two. The four dolls form a magic simulacrum which stops the incest by removing the sister to the underworld, where she discovers her alter ego. Thus we can say that the witch who gave the young prince the fatal ring was his mother-in-law-to-be, for, as a witch, she must certainly have known that the ring would fit not only his sister but her own daughter.

[431] In both tales the incest is an evil fate that cannot easily be avoided. Incest, as an endogamous relationship, is an expression of the libido which serves to hold the family together. One could therefore define it as “kinship libido,” a kind of instinct which, like a sheep-dog, keeps the family group intact. This form of libido is the diametrical opposite of the exogamous form. The two forms together hold each other in check: the endogamous form tends towards the sister and the exogamous form towards some stranger. The best compromise is therefore a first cousin. There is no hint of this in our fairy-stories, but the marriage quaternio is clear enough. In the Icelandic story we have the schema:

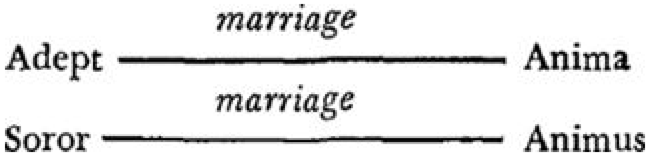


In the Russian:



[432] The two schemata agree in a remarkable way. In both cases the hero wins a bride who has something to do with magic or the world beyond.

Assuming that the archetype of the marriage quaternio described above is at the bottom of these folkloristic quaternities, the stories are obviously based on the following schema:



[433] Marriage with the anima is the psychological equivalent of absolute identity between conscious and unconscious. But since such a condition is possible only in the complete absence of psychological self-knowledge, it must be more or less primitive, i.e., the man's relationship to the woman is essentially an anima projection. The only sign that the whole thing is unconscious is the remarkable fact that the carrier of the animaimage is distinguished by magical characteristics. These characteristics are missing from the soror-animus relationship in the stories; that is, the unconscious does not make itself felt at all as a separate experience. From this we must conclude that the symbolism of the stories rests on a much more primitive mental structure than the alchemical quaternio and its psychological equivalent. Therefore we must expect that on a still more primitive level the anima too will lose her magical attributes, the result being an uncomplicated, purely matter-of-fact marriage quaternio. And we do find a parallel to the two crossed pairs in the so-called "cross-cousin marriage." In order to explain this primitive form of marriage I must go into some detail. The marriage of a man's sister to his wife's brother is a relic of the "sister-exchange marriage" characteristic of the structure of many primitive tribes. But at the same time this double marriage is the primitive parallel of the problem which concerns us here: the conscious and unconscious dual relationship between adept and soror on the one hand and king and queen (or animus and anima) on the other. John Layard's important study, "The Incest Taboo and the Virgin Archetype," put me in mind of the sociological aspects of our psychologem. The primitive tribe falls into two halves, of which Howitt says: "It is upon the division of the whole community into two exogamous intermarrying classes that the whole social structure is built up."[22] These "moieties" show themselves in the

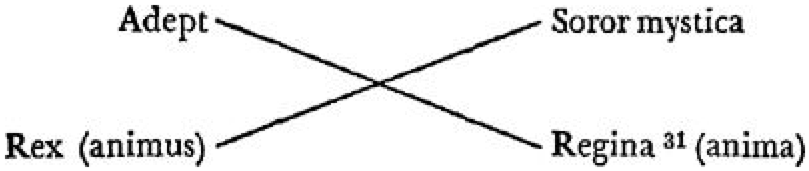
lay-out of settlements[23] as well as in many strange customs. At ceremonies, for instance, the two moieties are strictly segregated and neither may trespass on the other's territory. Even when going out on a hunt, they at once divide into two halves as soon as they set up camp, and the two camps are so arranged that there is a natural obstacle between them, e.g., the bed of a stream. On the other hand the two halves are connected by what Hocart calls "the ritual interdependence of the two sides" or "mutual ministration." In New Guinea one side breeds and fattens pigs and dogs, not for themselves but for the other side, and vice versa. Or when there is a death in the village and the funeral feast is prepared, this is eaten by the other side, and so on.[24] [Another form of such division elsewhere is][25] the widespread institution of "dual kingship."[26]

[434] The names given to the two sides are particularly enlightening, such as—to mention only a few—east and west, high and low, day and night, male and female, water and land, left and right. It is not difficult to see from these names that the two halves are felt to be antithetical and thus the expression of an endopsychic antithesis. The antithesis can be formulated as the masculine ego versus the feminine "other," i.e., conscious versus unconscious personified as anima. The primary splitting of the psyche into conscious and unconscious seems to be the cause of the division within the tribe and the settlement. It is a division founded on fact but not consciously recognized as such.

[435] The social split is by origin a matrilineal division into two, but in reality it represents a division of the tribe and settlement into four. The quartering comes about through the crossing of the matrilineal by a patrilineal line of division, [so that the entire population is divided into patrilineal as well as matrilineal moieties].[27] The practical purpose of this quartering is the separation and differentiation of marriage classes, [or "kinship sections," as they are now called]. The basic pattern is a square or circle divided by a cross; it forms the ground-plan of the primitive settlement and the archaic city, also of monasteries, convents, etc., as can be seen in Europe, Asia, and prehistoric America.[28] The Egyptian hieroglyph for "city" is a St. Andrew's cross in a circle.[29]

[436] In specifying the marriage classes, it should be mentioned that every man belongs to his father’s patrilineal moiety, [and the woman he marries must not come from his mother’s moiety. In other words, he can take a wife only from the opposite matrilineal *and* patrilineal moiety.] In order to avoid the possibility of incest, he marries his mother’s brother’s daughter and gives his sister to his wife’s brother (sister-exchange marriage). This results in the cross-cousin marriage.[30]

[437] This form of union, consisting of two brother-and-sister marriages crossing each other, seems to be the original model for the peculiar psychologem which we find in alchemy:



When I say “model” I do not mean that the system of marriage classes was the cause and our psychologem the effect. I merely wish to point out that this system predated the alchemical quaternio. Nor can we assume that the primitive marriage quaternio is the absolute origin of this archetype, for the latter is not a human invention at all but a fact that existed long before consciousness, as is true of all ritual symbols among primitives as well as among civilized peoples today. We do certain things simply without thinking, because they have always been done like that.[32]

[438] The difference between the primitive and the cultural marriage quaternio consists in the fact that the former is a sociological and the latter a mystical phenomenon. While marriage classes have all but disappeared among civilized peoples, they nevertheless re-emerge on a higher cultural level as spiritual ideas. In the interests of the welfare and development of the tribe, the exogamous social order thrust the endogamous tendency into the background so as to prevent the danger of regression to a state of having no groups at all. It insisted on the introduction of “new blood” both physically and spiritually, and it thus proved to be a powerful instrument in the development of culture. In the words of Spencer and Gillen: “This system of what has been called group marriage, serving as it does to bind more or less closely together groups

of individuals who are mutually interested in one another's welfare, has been one of the most powerful agents in the early stages of the upward development of the human race."[33] Layard has amplified this idea in his above-mentioned study. He regards the endogamous (incest) tendency as a genuine instinct which, if denied realization in the flesh, must realize itself in the spirit. Just as the exogamous order made culture possible in the first place, so also it contains a latent spiritual purpose. Layard says: "Its latent or spiritual purpose is to enlarge the spiritual horizon by developing the idea that there is after all a sphere in which the primary desire may be satisfied, namely the divine sphere of the gods together with that of their semi-divine counterparts, the culture heroes."[34] The idea of the incestuous hierosgamos does in fact appear in the civilized religions and blossoms forth in the supreme spirituality of Christian imagery (Christ and the Church, *sponsus* and *sponsa*, the mysticism of the Song of Songs, etc.). "Thus the incest taboo," says Layard, "leads in full circle out of the biological sphere into the spiritual."[35] On the primitive level the feminine image, the anima, is still completely unconscious and therefore in a state of latent projection. Through the differentiation of the "four-class marriage system" into the eight-class,[36] the degree of kinship between marriage partners is considerably diluted, and in the twelve-class system it becomes [further reduced]. These "dichotomies"[37] obviously serve to enlarge the framework of the marriage classes and thus to draw more and more groups of people into the kinship system. Naturally such an enlargement was possible only where a sizeable population was expanding.[38] The eight-class and particularly the twelve-class systems mean a great advance for the exogamous order, but an equally severe repression of the endogamous tendency, which is thereby stimulated to a new advance in its turn. Whenever an instinctive force—i.e., a certain sum of psychic energy—is driven into the background through a onesided (in this case, exogamous) attitude on the part of the conscious mind, it leads to a dissociation of personality. The conscious personality with its one-track (exogamous) tendency comes up against an invisible (endogamous) opponent, and because this is unconscious it is felt to be a stranger and therefore manifests itself in projected form. At first it makes its appearance in human figures who have the power to do what others may not do—kings and princes, for example. This is probably the reason for the royal incest prerogative, as in ancient Egypt. To the extent that the magical power of royalty was derived increasingly from the gods, the incest prerogative shifted to the latter and so gave rise to the incestuous hierosgamos. But when the numinous aura surrounding the person of the king is taken over by the gods, it has been transferred to a spiritual authority, which results in the projection of an autonomous psychic complex—in other words, psychic existence becomes reality. Thus Layard logically derives the anima from the numen of the goddess.[39] In the shape of the goddess the anima is manifestly projected, but in her proper (psychological) shape she is *introjected;* she is, as Layard says, the "anima within." She is the natural *sponsa*, man's mother or sister or daughter or wife from the beginning, the companion whom the endogamous tendency vainly seeks to win in the form of mother and sister. She represents that longing which has always had to be sacrificed since the grey dawn of history. Layard therefore speaks very rightly of "internalization through sacrifice."[40]

[439] The endogamous tendency finds an outlet in the exalted sphere of the gods and in the higher world of the spirit. Here it shows itself to be an instinctive force of a spiritual nature; and, regarded in this light, the life of the spirit on the highest level is a return to the beginnings, so that man's development becomes a recapitulation of the stages that lead ultimately to the perfection of life in the spirit.

[440] The specifically alchemical projection looks at first sight like a regression: god and goddess are reduced to king and queen, and these in turn look like mere allegories of chemical substances which are about to combine. But the regression is only apparent. In reality it is a highly remarkable development: the conscious mind of the medieval investigator was still under the influence of metaphysical ideas, but because he could not derive them from nature he projected them into nature. He sought for them in matter, because he supposed that they were most likely to be found there. It was really a question of a transference of numen the converse of that from the king to the god. The numen seemed to have migrated in some mysterious way from the world of the spirit to the realm of matter. But the descent of the projection into matter had led

some of the old alchemists, for example Morienus Romanus, to the clear realization that this matter was not just the human body (or something in it) but the human personality itself. These prescient masters had already got beyond the inevitable stage of obtuse materialism that had yet to be born from the womb of time. But it was not until the discoveries of modern psychology that this human "matter" of the alchemists could be recognized as the *psyche*.

[441] On the psychological level, the tangle of relationships in the cross-cousin marriage reappears in the transference problem. The dilemma here consists in the fact that anima and animus are projected upon their human counterparts and thus create by suggestion a primitive relationship which evidently goes back to the time of group marriages. But in so far as anima and animus undoubtedly represent the contrasexual components of the personality, their kinship character does not point backwards to the group marriage but "forwards" to the integration of personality, i.e., to individuation.

[442] Our present-day civilization with its cult of consciousness—if this can be called civilization—has a Christian stamp, which means that neither anima nor animus is integrated but is still in the state of projection, i.e., expressed by dogma. On this level both these figures are unconscious as components of personality, though their effectiveness is still apparent in the numinous aura surrounding the dogmatic ideas of bridegroom and bride. Our "civilization," however, has turned out to be a very doubtful proposition, a distinct falling away from the lofty ideal of Christianity; and, in consequence, the projections have largely fallen away from the divine figures and have necessarily settled in the human sphere. This is understandable enough, since the "enlightened" intellect cannot imagine anything greater than man except those tin gods with totalitarian pretensions who call themselves State or Fuehrer. This regression has made itself as plain as could be wished in Germany and other countries. And even where it is not so apparent, the lapsed projections have a disturbing effect on human relationships and wreck at least a quarter of the marriages. If we decline to measure the vicissitudes of the world's history by the standards of right and wrong, true and false, good and evil, but prefer to see the retrograde step in every advance, the

evil in every good, the error in every truth, we might compare the present regression with the apparent retreat which led from scholasticism to the mystical trend of natural philosophy and thence to materialism. Just as materialism led to empirical science and thus to a new understanding of the psyche, so the totalitarian psychosis with its frightful consequences and the intolerable disturbance of human relationships are forcing us to pay attention to the psyche and our abysmal unconsciousness of it. Never before has mankind as a whole experienced the numen of the psychological factor on so vast a scale. In one sense this is a catastrophe and a retrogression without parallel, but it is not beyond the bounds of possibility that such an experience also has its positive aspects and might become the seed of a nobler culture in a regenerated age. It is possible that the endogamous urge is not ultimately tending towards projection at all; it may be trying to unite the different components of the personality on the pattern of the cross-cousin marriage, but on a higher plane where "spiritual marriage" becomes an inner experience that is not projected. Such an experience has long been depicted in dreams as a mandala divided into four, and it seems to represent the goal of the individuation process, i.e., the self.

[443] Following the growth of population and the increasing dichotomy of the marriage classes, which led to a further extension of the exogamous order, all barriers gradually broke down and nothing remained but the incest-taboo. The original social order made way for other organizing factors culminating in the modern idea of the State. Now, everything that is past sinks in time into the unconscious, and this is true also of the original social order. It represented an archetype that combined exogamy and endogamy in the most fortunate way, for while it prevented marriage between brother and sister it provided a substitute in the cross-cousin marriage. This relationship is still close enough to satisfy the endogamous tendency more or less, but distant enough to include other groups and to extend the orderly cohesion of the tribe. But with the gradual abolition of exogamous barriers through increasing dichotomy, the endogamous tendency was bound to gain strength in order to give due weight to consanguineous relationships and so hold them together. This reaction was chiefly felt in the religious and then in the political field,

with the growth on the one hand of religious societies and sects—we have only to think of the brotherhoods and the Christian ideal of "brotherly love"—and of nations on the other. Increasing internationalism and the weakening of religion have largely abolished or bridged over these last remaining barriers and will do so still more in the future, only to create an amorphous mass whose preliminary symptoms can already be seen in the modern phenomenon of the mass psyche. Consequently the original exogamous order is rapidly approaching a condition of chaos painfully held in check. For this there is but one remedy: the inner consolidation of the individual, who is otherwise threatened with inevitable stultification and dissolution in the mass psyche. The recent past has given us the clearest possible demonstration of what this would mean. No religion has afforded any protection, and our organizing factor, the State, has proved to be the most efficient machine for turning out mass-men. In these circumstances the immunizing of the individual against the toxin of the mass psyche is the only thing that can help. As I have already said, it is just conceivable that the endogamous tendency will intervene compensatorily and restore the consanguineous marriage, or the union of the divided components of the personality, on the psychic level—that is to say, *within* the individual. This would form a counterbalance to the progressive dichotomy and psychic dissociation of collective man.

[444] It is of supreme importance that this process should take place *consciously*, otherwise the psychic consequences of massmindedness will harden and become permanent. For, if the inner consolidation of the individual is not a conscious achievement, it will occur spontaneously and will then take the well-known form of that incredible hard-heartedness which collective man displays towards his fellow men. He becomes a soulless herd animal governed only by panic and lust: his soul, which can live only in and from human relationships, is irretrievably lost. But the conscious achievement of inner unity clings to human relationships as to an indispensable condition, for without the conscious acknowledgment and acceptance of our fellowship with those around us there can be no synthesis of personality. That mysterious something in which the inner union takes place is nothing personal, has nothing to do

with the ego, is in fact superior to the ego because, as the self, it is the synthesis of the ego and the supra-personal unconscious. The inner consolidation of the individual is not just the hardness of collective man on a higher plane, in the form of spiritual aloofness and inaccessibility: it emphatically includes our fellow man.

[445] To the extent that the transference is projection and nothing more, it divides quite as much as it connects. But experience teaches that there is one connection in the transference which does not break off with the severance of the projection. That is because there is an extremely important instinctive factor behind it: the kinship libido. This has been pushed so far into the background by the unlimited expansion of the exogamous tendency that it can find an outlet, and a modest one at that, only within the immediate family circle, and sometimes not even there, because of the quite justifiable resistance to incest. While exogamy was limited by endogamy, it resulted in a natural organization of society which has entirely disappeared today. Everyone is now a stranger among strangers. Kinship libido—which could still engender a satisfying feeling of belonging together, as for instance in the early Christian communities—has long been deprived of its object. But, being an instinct, it is not to be satisfied by any mere substitute such as a creed, party, nation, or state. It wants the *human* connection. That is the core of the whole transference phenomenon, and it is impossible to argue it away, because relationship to the self is at once relationship to our fellow man, and no one can be related to the latter until he is related to himself.

[446] If the transference remains at the level of projection, the connection it establishes shows a tendency to regressive concretization, i.e., to an atavistic restoration of the primitive social order. This tendency has no possible foothold in our modern world, so that every step in this direction only leads to a deeper conflict and ultimately to a real transference neurosis. Analysis of the transference is therefore an absolute necessity, because the projected contents must be reintegrated if the patient is to gain the broader view he needs for free decision.

[447] If, however, the projection is broken, the connection—whether it be negative (hate) or positive (love)—may collapse for the time being so

that nothing seems to be left but the politeness of a professional tête-à-tête. One cannot begrudge either doctor or patient a sigh of relief when this happens, although one knows full well that the problem has only been postponed for both of them. Sooner or later, here or in some other place, it will present itself again, for behind it there stands the restless urge towards individuation.

[448] Individuation has two principal aspects: in the first place it is an internal and subjective process of integration, and in the second it is an equally indispensable process of objective relationship. Neither can exist without the other, although sometimes the one and sometimes the other predominates. This double aspect has two corresponding dangers. The first is the danger of the patient's using the opportunities for spiritual development arising out of the analysis of the unconscious as a pretext for evading the deeper human responsibilities, and for affecting a certain "spirituality" which cannot stand up to moral criticism; the second is the danger that atavistic tendencies may gain the ascendency and drag the relationship down to a primitive level. Between this Scylla and that Charybdis there is a narrow passage, and both medieval Christian mysticism and alchemy have contributed much to its discovery.

[449] Looked at in this light, the bond established by the transference—however hard to bear and however incomprehensible it may seem—is vitally important not only for the individual but also for society, and indeed for the moral and spiritual progress of mankind. So, when the psychotherapist has to struggle with difficult transference problems, he can at least take comfort in these reflections. He is not just working for this particular patient, who may be quite insignificant, but for himself as well and his own soul, and in so doing he is perhaps laying an infinitesimal grain in the scales of humanity's soul. Small and invisible as this contribution may be, it is yet an *opus magnum,* for it is accomplished in a sphere but lately visited by the numen, where the whole weight of mankind's problems has settled. The ultimate questions of psychotherapy are not a private matter—they represent a supreme responsibility.

3

THE NAKED TRUTH

[450] The text to this picture (Fig. 3) is, with a few alterations, a quotation from the “Tractatus aureus.”[1] It runs: “He who would be initiated into this art and secret wisdom must put away the vice of arrogance, must be devout, righteous, deep-witted, humane towards his fellows, of a cheerful countenance and a happy disposition, and respectful withal. Likewise he must be an observer of the eternal secrets that are revealed to him. My son, above all I admonish thee to fear God who seeth what manner of man thou art [*in quo dispositionis tuae visus est*] and in whom is help for the solitary, whosoever he may be [*adiuvatio cuiuslibet sequestrati].*”[2] And the *Rosarium* adds from Pseudo-Aristotle: “Could God but find a man of faithful understanding, he would open his secret to him.”[3]

[451] This appeal to obviously moral qualities makes one thing quite clear: the *opus* demands not only intellectual and technical ability as in the study and practice of modern chemistry; it is a moral as well as a psychological undertaking. The texts are full of such admonitions, and they indicate the kind of attitude that is required in the execution of a religious work. The alchemists undoubtedly understood the *opus* in this sense, though it is difficult to square our picture with such an exordium. The chaste disguises have fallen away.[4] Man and woman confront one another in unabashed naturalness. Sol says, “O Luna, let[5] me be thy husband,” and Luna, “O Sol, I must submit to thee.” The dove bears the inscription: “Spiritus est qui unificat.”[6] This remark hardly fits the unvarnished eroticism of the picture, for if what Sol and Luna say—who, be it noted, are brother and sister—means anything at all, it must surely mean earthly love. But since the spirit descending from above is stated to be the mediator,[7] the situation acquires another aspect: it is supposed to be a union in the spirit. This is borne out admirably by one important detail in the picture: the contact of left hands has ceased. Instead, Luna’s left hand and Sol’s right hand now hold the branches (from which spring

the *flores Mercurii*, corresponding to the three pipes of the fountain), while Luna's right and Sol's left hand are touching the flowers. The left-handed relationship is no more: the two hands of both are now connected with the "uniting symbol." This too has been changed: there are only three flowers instead of five, it is no longer an ogdoad but a hexad,[8] a sixrayed figure. The double quaternity has thus been replaced by a double triad. This simplification is evidently the result of the fact that two elements have each paired off, presumably with their opposites, for according to alchemical theory each element contains its opposite "within" it. Affinity, in the form of a "loving" approach, has already achieved a partial union of the elements, so that now only one pair of opposites remains: masculine-feminine or *agens-patiens*, as indicated by the inscription. In accordance with the axiom of Maria, the elementary quaternity has become the active triad, and this will lead to the *coniunctio* of the two.

PHILOSOPHORVM.

ſeipſis ſecundum ęqualitatē inſpiſſentur. Solus enim calor tēperatus eſt humiditatis inſpiſſatiuus et mixtionis perfectiuus, et non ſuper excedens. Nā generatiōes et procreationes rerū naturaliū habent ſolū fieri per tēperatiſsimū calorē et ęqualē, vti eſt ſolus fimus equinus humidus et calidus.

Figure 3

[452] Psychologically we can say that the situation has thrown off the conventional husk and developed into a stark encounter with reality, with no false veils or adornments of any kind. Man stands forth as he really is and shows what was hidden under the mask of conventional adaptation: the shadow. This is now raised to consciousness and integrated with the ego, which means a move in the direction of wholeness. Wholeness is not so much perfection as completeness. Assimilation of the shadow gives a man body, so to speak; the animal sphere of instinct, as well as the primitive or archaic psyche, emerge into the zone of consciousness and can no longer be repressed by fictions and illusions. In this way man becomes for himself the difficult problem he really is. He must always

remain conscious of the fact that he is such a problem if he wants to develop at all. Repression leads to a one-sided development if not to stagnation, and eventually to neurotic dissociation. Today it is no longer a question of "How can I get rid of my shadow?"—for we have seen enough of the curse of one-sidedness. Rather we must ask ourselves: "How can man live with his shadow without its precipitating a succession of disasters?" Recognition of the shadow is reason enough for humility, for genuine fear of the abysmal depths in man. This caution is most expedient, since the man without a shadow thinks himself harmless precisely because he is ignorant of his shadow. The man who recognizes his shadow knows very well that he is not harmless, for it brings the archaic psyche, the whole world of the archetypes, into direct contact with the conscious mind and saturates it with archaic influences. This naturally adds to the dangers of "affinity," with its deceptive projections and its urge to assimilate the object in terms of the projection, to draw it into the family circle in order to actualize the hidden incest situation, which seems all the more attractive and fascinating the less it is understood. The advantage of the situation, despite all its dangers, is that once the naked truth has been revealed the discussion can get down to essentials; ego and shadow are no longer divided but are brought together in an—admittedly precarious—unity. This is a great step forward, but at the same time it shows up the "differentness" of one's partner all the more clearly, and the unconscious usually tries to close the gap by increasing the attraction, so as to bring about the desired union somehow or other. All this is borne out by the alchemical idea that the fire which maintains the process must be temperate to begin with and must then gradually be raised to the highest intensity.

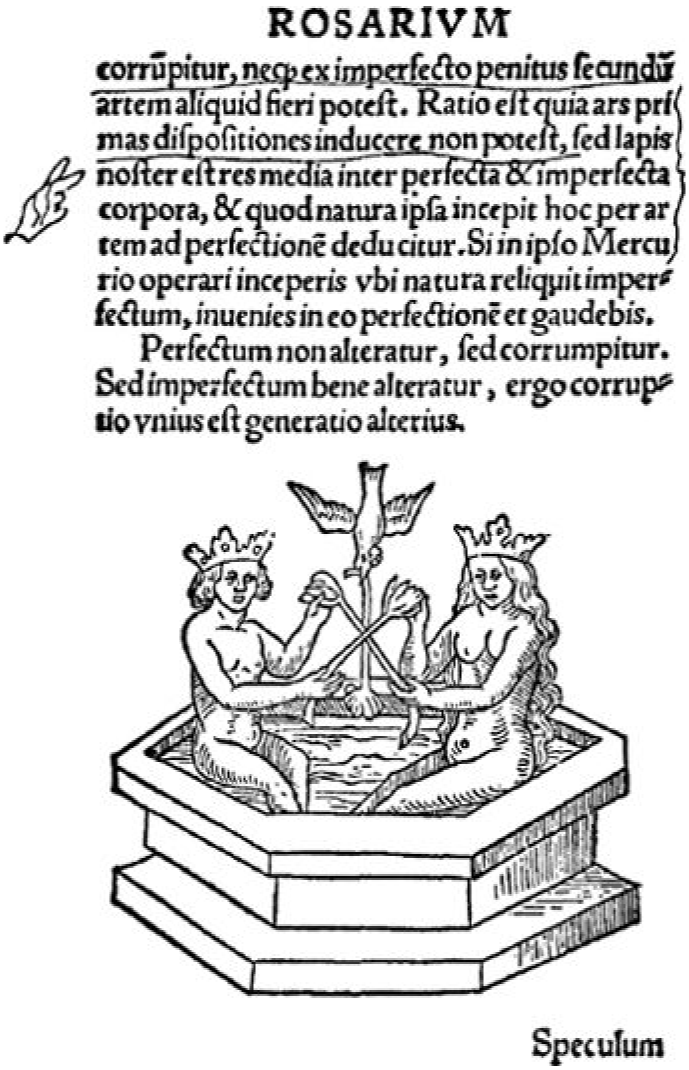
4

IMMERSION IN THE BATH

[453] A new motif appears in this picture: the bath. In a sense this takes us back to the first picture of the Mercurial Fountain, which represents the "upwelling." The liquid is Mercurius, not only of the three but of the "thousand" names. He stands for the mysterious psychic substance which nowadays we would call the unconscious psyche. The rising fountain of the unconscious has reached the king and queen, or rather they have descended into it as into a bath. This is a theme with many variations in alchemy. Here are a few of them: the king is in danger of drowning in the sea; he is a prisoner under the sea; the sun drowns in the mercurial fountain; the king sweats in the glass-house; the green lion swallows the sun; Gabricus disappears into the body of his sister Beya, where he is dissolved into atoms; and so forth. Interpreted on the one hand as a harmless bath and on the other hand as the perilous encroachment of the "sea," the earth-spirit Mercurius in his watery form now begins to attack the royal pair from *below*, just as he had previously descended from above in the shape of the dove. The contact of left hands in Figure 2 has evidently roused the spirit of the deep and called up a rush of water.

[454] The immersion in the "sea" signifies the *solutio*— "dissolution" in the physical sense of the word and at the same time, according to Dorn, the solution of a problem.[1] It is a return to the dark initial state, to the amniotic fluid of the gravid uterus. The alchemists frequently point out that their stone grows like a child in its mother's womb; they call the *vas hermeticum* the uterus and its contents the foetus. What is said of the *lapis* is also said of the water: "This stinking water contains everything it needs."[2] It is sufficient unto itself, like the Uroboros, the tail-eater, which is said to beget, kill, and devour itself. *Aqua est, quae occidit et vivificat* — the water is that which kills and vivifies.[3] It is the *aqua benedicta*, the lustral water,[4]wherein the birth of the new being is prepared. As the text to our picture explains: "Our stone is to be extracted from the nature of the two bodies." It also likens the water to the *ventus* of the "Tabula

smaragdina," where we read: "Portavit eum ventus in ventre suo" (The wind hath carried it in his belly). The *Rosarium* adds: "It is clear that wind is air, and air is life, and life is soul, that is, oil and water."[5] The curious idea that the soul (i.e., the breath-soul) is oil and water derives from the dual nature of Mercurius. The *aqua permanens* is one of his many synonyms, and the terms *oleum, oleaginitas, unctuosum, unctuositas,* all refer to the arcane substance which is likewise Mercurius. The idea is a graphic reminder of the ecclesiastical use of various unguents and of the consecrated water. The two bodies mentioned above are represented by the king and queen, a possible reference to the *commixtio* of the two substances in the chalice of the Mass. A similar *coniunctio* is shown in the "Grandes heures du duc de Berry,"[6] where a naked "little man and woman" are being anointed by two saintly servitors in the baptismal bath of the chalice. There can be no doubt of the connections between the alchemical *opus* and the Mass, as the treatise of Melchior Cibinensis[7] proves. Our text says: "Anima est Sol et Luna." The alchemist thought in strictly medieval trichotomous terms:[8] anything alive—and his *lapis* is undoubtedly alive—consists of corpus, anima, and spiritus. The *Rosarium* remarks (p. 239) that "the body is Venus and feminine, the spirit is Mercurius and masculine"; hence the anima, as the "vinculum," the link between body and spirit, would be hermaphroditic,[9] i.e., a *coniunctio Solis et Lunae*. Mercurius is the hermaphrodite par excellence. From all this it may be gathered that the queen stands for the body[10] and the king for the spirit,[11] but that both are unrelated without the soul, since this is the *vinculum* which holds them together.[12] If no bond of love exists, they have no soul. In our pictures the bond is effected by the dove from above and by the water from below. These constitute the link—in other words, they are the soul. Thus the underlying idea of the psyche proves it to be a half bodily, half spiritual substance, an *anima media natura*,[13] as the alchemists call it,[14] an hermaphroditic being[15] capable of uniting the opposites, but who is never complete in the individual unless related to another individual. The unrelated human being lacks wholeness, for he can achieve wholeness only through the soul, and the soul cannot exist without its other side, which is always found in a "You." Wholeness is a combination of I and You, and these show themselves to be parts of a transcendent unity[16] whose nature can only be grasped symbolically, as in the symbols of the *rotundum*, the rose, the wheel,[17] or the *coniunctio Solis et Lunae*. The alchemists even go so far as to say that the *corpus*, *anima*, and *Spiritus* of the arcane substance are one, "because they are all from the One, and of the One, and with the One, which is the root of itself" (Quia ipsa omnia sunt ex uno et de uno et cum uno, quod est radix ipsius).[18] A thing which is the cause and origin of itself can only be God, unless we adopt the implied dualism of the Paracelsists, who were of the opinion that the *prima materia* is an *increatum*.[19] Similarly, the pre-Paracelsist *Rosarium*[20] maintains that the quintessence is a "self-subsistent body, differing from all the elements and from everything composed thereof."



ROSARIVM

corrũpitur, neq; ex imperfecto penitus ſecundũ artem aliquid fieri poteſt. Ratio eſt quia ars primas diſpoſitiones inducere non poteſt, ſed lapis noſter eſt res media inter perfecta & imperfecta corpora, & quod natura ipſa incepit hoc per artem ad perfectionẽ deducitur. Si in ipſo Mercurio operari inceperis vbi natura reliquit imperfectum, inuenies in eo perfectionẽ et gaudebis.

Perfectum non alteratur, ſed corrumpitur. Sed imperfectum bene alteratur, ergo corruptio vnius eſt generatio alterius.

Speculum

Figure 4

[455] Coming now to the psychology of the picture, it is clearly a descent into the unconscious. The immersion in the bath is another “night sea journey,”[21] as the “Visio Arislei” proves. There the philosophers are shut up with the brother-sister pair in a triple glass-house at the bottom of the sea by the *Rex Marinus*. Just as, in the primitive myths, it is so stiflingly hot in the belly of the whale that the hero loses his hair, so the philosophers suffer very much from the intense heat[22] during their confinement. The hero-myths deal with rebirth and apocatastasis, and the “Visio” likewise tells of the resuscitation of the dead Thabritius (Gabricus) or, in another version, of his rebirth.[23] The night sea journey is a kind of *descensus ad in-feros*— a descent into Hades and a journey to the land of ghosts somewhere beyond this world, beyond consciousness, hence an immersion in the unconscious. In our picture the immersion is effected by the rising up of the fiery, chthonic Mercurius, presumably the sexual libido which engulfs the pair[24] and is the obvious counterpart to the heavenly dove. The latter has always been regarded as a love-bird, but it also has a purely spiritual significance in the Christian tradition accepted by the alchemists. Thus the pair are united *above* by the symbol of the Holy Ghost, and it looks as if the immersion in the bath were also uniting them *below*, i.e., in the water which is the counterpart of spirit (“It is death for souls to become water,” says Heraclitus). Opposition and identity at once—a philosophical problem only when taken as a psychological one!

[456] This development recapitulates the story of how the Original Man (Nous) bent down from heaven to earth and was wrapped in the embrace of Physis—a primordial image that runs through the whole of alchemy. The modern equivalent of this stage is the conscious realization of sexual fantasies which colour the transference accordingly. It is significant that even in this quite unmistakable situation the pair are still holding on with both hands to the starry symbol brought by the Holy Ghost, which signalizes the meaning of their relationship: man’s longing for transcendent wholeness.

5

THE CONJUNCTION

O Luna, folded in my sweet embrace/
Be you as strong as I, as fair of face.
O Sol, brightest of all lights known to men/
And yet you need me, *as* the *cock* the *hen*.

[*Figure 5*]

[457] The sea has closed over the king and queen, and they have gone back to the chaotic beginnings, the *massa confusa*. Physis has wrapped the "man of light" in a passionate embrace. As the text says: "Then Beya [the maternal sea] rose up over Gabricus and enclosed him in her womb, so that nothing more of him was to be seen. And she embraced Gabricus with so much love that she absorbed him completely into her own nature, and dissolved him into atoms." These verses from Merculinus are then quoted:

Candida mulier, si rubeo sit nupta marito,
Mox complexantur, complexaque copulantur,
Per se solvuntur, per se quoque conficiuntur,
Ut duo qui fuerant, unum quasi corpore fiant.

(White-skinned lady, lovingly joined to her ruddy-limbed husband, Wrapped in each other's arms in the bliss of connubial union, Merge and dissolve as they come to the goal of perfection: They that were two are made one, as though of one body.)

[458] In the fertile imagination of the alchemists, the hierosgamos of Sol and Luna continues right down to the animal kingdom, as is shown by the following instructions: "Take a Coetanean dog and an Armenian bitch, mate them, and they will bear you a son in the likeness of a dog."[1] The symbolism is about as crass as it could be. On the other hand the *Rosarium*[2] says: "In hora coniunctionis maxima apparent miracula" (In the hour of conjunction the greatest marvels appear). For this is the moment when the *filius philosophorum* or *lapis* is begotten. A quotation

from Alfidius[3] adds: “Lux moderna ab eis gignitur” (The new light is begotten by them). Kalid says of the “son in the likeness of a dog” that he is “of a celestial hue” and that “this son will guard you… in this world and in the next.”[4] Likewise Senior: “She hath borne a son who served his parents in all things, save that he is more splendid and refulgent than they,”[5] i.e., he outshines the sun and moon. The real meaning of the *coniunctio* is that it brings to birth something that is one and united. It restores the vanished “man of light” who is identical with the Logos in Gnostic and Christian symbolism and who was there before the creation; we also meet him at the beginning of the Gospel of St. John. Consequently we are dealing with a cosmic idea, and this amply explains the alchemists’ use of superlatives.

[459] The psychology of this central symbol is not at all simple. On a superficial view it looks as if natural instinct had triumphed. But if we examine it more closely we note that the coitus is taking place in the water, the *mare tenebrositatis*, i.e., the unconscious. This idea is borne out by a variant of the picture (Figure 5a). There again Sol and Luna are in the water, but both are winged. They thus represent spirit—they are aerial beings, creatures of thought. The texts indicate that Sol and Luna are two *vapores* or *fumi* which gradually develop as the fire increases in heat, and which then rise as on wings from the *decoctio* and *digestio* of the *prima materia*.[6] That is why the paired opposites are sometimes represented as two birds fighting[7] or as winged and wingless dragons.[8] The fact that two aerial creatures should mate on or beneath the water does not disturb the alchemist in the least, for he is so familiar with the changeable nature of his synonyms that for him water is not only fire but all sorts of astonishing things besides. If we interpret the water as steam we may be getting nearer the truth. It refers to the boiling solution in which the two substances unite.

CONIVNCTIO SIVE
Coitus.

O Luna durch meyn umbgeben/und ſuſſe mynne/
Wirſtu ſchön/ ſtarck/und gewaltig als ich byn.
O Sol/ du biſt uber alle liecht zu erkennen/
So bedarſſtu doch mein als der han der hennen.

ARISLEVS IN VISIONE.

Coniunge ergo filium tuum Gabricum dilectiorem tibi in omnibus filijs tuis cum ſua ſorore Beya

Figure 5

[460] As to the frank eroticism of the pictures, I must remind the reader that they were drawn for medieval eyes and that consequently they have a symbolical rather than a pornographic meaning. Medieval hermeneutics and meditation could contemplate even the most delicate passages in the Song of Songs without taking offence and view them through a veil of spirituality. Our pictures of the *coniunctio* are to be understood in this sense: union on the biological level is a symbol of the *unio oppositorum* at its highest. This means that the union of opposites in the royal art is just as real as coitus in the common acceptation of the word, so that the *opus* becomes an analogy of the natural process by means of which instinctive energy is transformed, at least in part, into symbolical activity.

The creation of such analogies frees instinct and the biological sphere as a whole from the pressure of unconscious contents. Absence of symbolism, however, overloads the sphere of instinct.[9] The analogy contained in Figure 5 is a little too obvious for our modern taste, so that it almost fails in its purpose.

Figure 5a

[461] As every specialist knows, the psychological parallels encountered in medical practice often take the form of fantasy-images which, when drawn, differ hardly at all from our pictures. The reader may remember the typical case I mentioned earlier (par. 377ff.), where the act of conception was represented symbolically and, exactly nine months later, the unconscious, as though influenced by a *suggestion à échéance*, produced the symbolism of a birth, or of a new-born child, without the

patient's being conscious of the preceding psychic conception or having consciously reckoned the period of her "pregnancy." As a rule the whole process passes off in a series of dreams and is discovered only retrospectively, when the dream material comes to be analysed. Many alchemists compute the duration of the *opus* to be that of a pregnancy, and they liken the entire procedure to such a period of gestation.[10]

[462] The main emphasis falls on the *unio mystica*, as is shown quite clearly by the presence of the uniting symbol in the earlier pictures. It is perhaps not without deeper significance that this symbol has disappeared in the pictures of the *coniunctio*. For at this juncture the meaning of the symbol is fulfilled: the partners have themselves become symbolic. At first each represented two elements; then each of them united into one (integration of the shadow); and finally the two together with the third become a whole—"ut duo qui fuerant, unum quasi corpore fiant." Thus the axiom of Maria is fulfilled. In this union the Holy Ghost disappears as well, but to make up for that, Sol and Luna themselves become spirit. The real meaning, therefore, is Goethe's "higher copulation,"[11] a union in unconscious identity, which could be compared with the primitive, initial state of chaos, the *massa confusa*, or rather with the state of *participation mystique* where heterogeneous factors merge in an unconscious relationship. The *coniunctio* differs from this not as a mechanism but because it is by nature never an initial state: it is always the product of a process or the goal of endeavour. This is equally the case in psychology, though here the *coniunctio* comes about unintentionally and is opposed to the bitter end by all biologically minded and conscientious doctors. That is why they speak of "resolving the transference." The detachment of the patient's projections from the doctor is desirable for both parties and, if successful, may be counted as a positive result. This is a practical possibility when, owing to the patient's immaturity, or his disposition, or because of some misunderstanding arising out of the projection, or because reason and plain common sense demand it, the continued transformation of projected unconscious contents comes to a hopeless standstill, and at the same time an opportunity presents itself from outside for the projection to be switched to another object. This solution has about the same merit as persuading a person not to go into a

monastery or not to set out on a dangerous expedition or not to make a marriage which everybody agrees would be stupid. We cannot rate reason highly enough, but there are times when we must ask ourselves: do we really know enough about the destinies of individuals to enable us to give good advice under *all* circumstances? Certainly we must act according to our best convictions, but are we so sure that our convictions are for the best as regards the other person? Very often we do not know what is best for ourselves, and in later years we may come to thank God from the bottom of our hearts that his kindly hand preserved us from the "reasonableness" of our former plans. It is easy for the critic to say after the event, "Ah, but that wasn't the right sort of reason!" Who can know with unassailable certainty when he has the right sort? Moreover, is it not essential to the true art of living, sometimes, in defiance of all reason and fitness, to include the unreasonable and the unfitting within the ambiance of the possible?

[463] It should therefore not surprise us to find that there are not a few cases where, despite every effort, no possibility presents itself of resolving the transference, although the patient is—from the rational point of view—equipped with the necessary understanding and neither he nor the doctor can be accused of any technical negligence or oversight. Both of them may be so deeply impressed by the vast irrationality of the unconscious as to come to the conclusion that the best thing is to cut the Gordian knot with a drastic decision. But the surgical partition of these Siamese twins is a perilous operation. There may be successes, though in my experience they are few and far between. I am all for a conservative solution of the problem. If the situation really is such that no other possibilities of any kind can be considered, and the unconscious obviously insists on the retention of the tie, then the treatment must be continued hopefully. It may be that the severance will only occur at a later stage, but it may also be a case of psychological "pregnancy" whose natural outcome must be awaited with patience, or again it may be one of those fatalities which, rightly or wrongly, we take on our own shoulders or else try to avoid. The doctor knows that always, wherever he turns, man is dogged by his fate. Even the simplest illness may develop surprising complications; or, equally unexpectedly, a condition that

seemed very serious may take a turn for the better. Sometimes the doctor’s art helps, sometimes it is useless. In the domain of psychology especially, where we still know so little, we often stumble upon the unforeseen, the inexplicable—something of which we can make neither head nor tail. Things cannot be forced, and wherever force seems to succeed it is generally regretted afterwards. Better always to be mindful of the limitations of one’s knowledge and ability. Above all one needs forbearance and patience, for often time can do more than art. Not everything can and must be cured. Sometimes dark moral problems or inexplicable twists of fate lie hidden under the cloak of a neurosis. One patient suffered for years from depressions and had an unaccountable phobia about Paris. She managed to rid herself of the depressions, but the phobia proved inaccessible. However, she felt so well that she was prepared to risk ignoring her phobia. She succeeded in getting to Paris, and the next day she lost her life in a car smash. Another patient had a peculiar and abiding horror of flights of steps. One day he got caught up in some street-rioting and shots were fired. He found himself in front of a public building with a broad flight of steps leading up to it. In spite of his phobia he dashed up them to seek shelter inside the building, and fell on the steps, mortally wounded by a stray bullet.

[464] These examples show that psychic symptoms need to be judged with the greatest caution. This is also true of the various forms of transference and its contents. They sometimes set the doctor almost insoluble problems or cause him all manner of worries which may go to the limits of the endurable and even beyond. Particularly if he has a marked ethical personality and takes his psychological work seriously, this may lead to moral conflicts and divided loyalties whose real or supposed incompatibility has been the occasion of more than one disaster. On the basis of long experience I would therefore like to warn against too much therapeutic enthusiasm. Psychological work is full of snags, but it is just here that incompetents swarm. The medical faculties are largely to blame for this, because for years they refused to admit the psyche among the aetiological factors of pathology, even though they had no other use for it. Ignorance is certainly never a recommendation, but often the best knowledge is not enough either. Therefore I say to the psychotherapist:

let no day pass without humbly remembering that everything has still to be learned.

[465] The reader should not imagine that the psychologist is in any position to explain what “higher copulation” is, or the *coniunctio*, or “psychic pregnancy,” let alone the “soul’s child.” Nor should one feel annoyed if the newcomer to this delicate subject, or one’s own cynical self, gets disgusted with these—as he thinks them—phoney ideas and brushes them aside with a pitying smile and an offensive display of tact. The unprejudiced scientific inquirer who seeks the truth and nothing but the truth must guard against rash judgments and interpretations, for here he is confronted with *psychological facts* which the intellect cannot falsify and conjure out of existence. There are among one’s patients intelligent and discerning persons who are just as capable as the doctor of giving the most disparaging interpretations, but who cannot avail themselves of such a weapon in the face of these insistent facts. Words like “nonsense” only succeed in banishing little things—not the things that thrust themselves tyrannically upon you in the stillness and loneliness of the night. The images welling up from the unconscious do precisely that. What we choose to call this fact does not affect the issue in any way. If it is an illness, then this *morbus sacer* must be treated according to its nature. The doctor can solace himself with the reflection that he, like the rest of his colleagues, does not only have patients who are curable, but chronic ones as well, where curing becomes nursing. At all events the empirical material gives us no sufficient grounds for always talking about “illness”; on the contrary, one comes to realize that it is a moral problem and often one wishes for a priest who, instead of confessing and proselytizing, would just listen, obey, and put this singular matter before God so that He could decide.

[466] *Patientia et mora* are absolutely necessary in this kind of work. One must be able to wait on events. Of work there is plenty—the careful analysis of dreams and other unconscious contents. Where the doctor fails, the patient will fail too, which is why the doctor should possess a real knowledge of these things and not just opinions, the offscourings of our modern philosophy for everyman. In order to augment this much-needed knowledge, I have carried my researches back to those earlier

times when naïve introspection and projection were still at work, mirroring a psychic hinterland that is virtually blocked for us today. In this way I have learned much for my own practice, especially as regards understanding the formidable fascination of the contents in question. These may not always strike the patient as particularly fascinating, so he suffers instead from a proportionately strong compulsive tie in whose intensity he can rediscover the force of those subliminal images. He will, however, try to interpret the tie rationalistically, in the spirit of the age, and consequently does not perceive and will not admit the irrational foundations of his transference, namely the archetypal images.

6

DEATH

Here King and Queen are lying dead/
In great distress the soul is sped.

[*Figure 6*]

[467] *Vas hermeticum*, fountain, and sea have here become sarcophagus and tomb. King and queen are dead and have melted into a single being with two heads. The feast of life is followed by the funereal threnody. Just as Gabricus dies after becoming united with his sister, and the son-lover always comes to an early end after consummating the hierosgamos with the mother-goddess of the Near East, so, after the *coniunctio oppositorum*, deathlike stillness reigns. When the opposites unite, all energy ceases: there is no more flow. The waterfall has plunged to its full depth in that torrent of nuptial joy and longing; now only a stagnant pool remains, without wave or current. So at least it appears, looked at from the outside. As the legend tells us, the picture represents the *putrefactio*, the corruption, the decay of a once living creature. Yet the picture is also entitled "Conceptio." The text says: "Corruptio unius generatio est alterius"—the corruption of one is the generation of the other,[1] an indication that this death is an interim stage to be followed by a new life. No new life can arise, say the alchemists, without the death of the old. They liken the art to the work of the sower, who buries the grain in the earth: it dies only to waken to new life.[2] Thus with their *mortificatio, interfectio, putrefactio, combustio, incineratio, calcinatio*, etc., they are imitating the work of nature. Similarly they liken their labours to human mortality, without which the new and eternal life cannot be attained.[3]

[468] The corpse left over from the feast is already a new body, a *hermaphroditus* (a compound of Hermes-Mercurius and Aphrodite-Venus). For this reason one half of the body in the alchemical illustrations is masculine, the other half feminine (in the *Rosarium* this is the left half). Since the *hermaphroditus* turns out to be the long-sought *rebis* or *lapis*, it symbolizes that mysterious being yet to be begotten, for

whose sake the *opus* is undertaken. But the *opus* has not yet reached its goal, because the *lapis* has not come alive. The latter is thought of as animal, a living being with body, soul, and spirit. The legend says that the pair who together represented body and spirit are dead, and that the soul (evidently only *one*[4] soul) parts from them "in great distress."[5] Although various other meanings play a part here, one cannot rid oneself of the impression that the death is a sort of tacit punishment for the sin of incest, for "the wages of sin is death."[6] That would explain the soul's "great distress" and also the blackness mentioned in the variant of our picture[7] ("Here is Sol turned black").[8] This blackness is the *immunditia* (uncleanliness), as is proved by the *ablutio* that subsequently becomes necessary. The *coniunctio* was incestuous and therefore sinful, leaving pollution behind it. The *nigredo* always appears in conjunction with *tenebrositas*, the darkness of the tomb and of Hades, not to say of Hell. Thus the descent that began in the marriage-bath has touched rock-bottom: death, darkness, and sin. For the adept, however, the hopeful side of things is shown in the anticipated appearance of the hermaphrodite, though the psychological meaning of this is at first obscure.

PHILOSOPHORVM.

CONCEPTIO SEV PVTRE

ARISTOTELES REX ET
Philoſophus.

NVnquam vidi aliquod animatum creſcere ſine putrefactione, niſi autem fiat putridum inuanum erit opus alchimicum.

Figure 6

[469] The situation described in our picture is a kind of Ash Wednesday. The reckoning is presented, and a dark abyss yawns. Death means the total extinction of consciousness and the complete stagnation of psychic life, so far as this is capable of consciousness. So catastrophic a consummation, which has been the object of annual lamentations in so many places (e.g., the laments for Linus, Tammuz,[9] and Adonis), must surely correspond to an important archetype, since even today we have our Good Friday. An archetype always stands for some typical event. As we have seen, there is in the *coniunctio* a union of two figures, one representing the daytime principle, i.e., lucid consciousness, the other a nocturnal light, the unconscious. Because the latter cannot be seen

directly, it is always projected; for, unlike the shadow, it does not belong to the ego but is collective. For this reason it is felt to be something alien to us, and we suspect it of belonging to the particular person with whom we have emotional ties. In addition a man's unconscious has a feminine character; it hides in the feminine side of him which he naturally does not see in himself but in the woman who fascinates him. That is probably why the soul (anima) is feminine. If, therefore, man and woman are merged in some kind of unconscious identity, he will take over the traits of her animus and she the traits of his anima. Although neither anima nor animus can be constellated without the intervention of the conscious personality, this does not mean that the resultant situation is nothing but a personal relationship and a personal entanglement. The personal side of it is a fact, but not the main fact. The main fact is the *subjective experience* of the situation—in other words, it is a mistake to believe that one's personal dealings with one's partner play the most important part. Quite the reverse: the most important part falls to the man's dealings with the anima and the woman's dealings with the animus. Nor does the *coniunctio* take place with the personal partner; it is a royal game played out between the active, masculine side of the woman (the animus) and the passive, feminine side of the man (the anima). Although the two figures are always tempting the ego to identify itself with them, a real understanding even on the personal level is possible only if the identification is refused. Non-identification demands considerable moral effort. Moreover it is only legitimate when not used as a pretext for avoiding the necessary degree of personal understanding. On the other hand, if we approach this task with psychological views that are too personalistic, we fail to do justice to the fact that we are dealing with an archetype which is anything but personal. It is, on the contrary, an *a priori* so universal in scope and incidence that it often seems advisable to speak less of *my* anima or *my* animus and more of *the* anima and *the* animus. As archetypes, these figures are semi-collective and impersonal quantities, so that when we identify ourselves with them and fondly imagine that we are then most truly ourselves, we are in fact most estranged from ourselves and most like the average type of *Homo sapiens*. The personal protagonists in the royal game should constantly bear in mind that at bottom it represents the "trans-subjective" union of archetypal figures, and it should never be forgotten that it is a *symbolical* relationship whose goal is complete individuation. In our series of pictures this idea is suggested *sub rosa*. Hence, when the *opus* interposes itself in the form of the rose or wheel, the unconscious and purely personal relationship becomes a psychological problem which, while it prevents a descent into complete darkness. does not in any way cancel out the operative force of the archetype. The right way, like the wrong way, must be paid for, and however much the alchemist may extol *venerabilis natura*, it is in either case an *opus contra naturam*. It goes against nature to commit incest, and it goes against nature not to yield to an ardent desire. And yet it is nature that prompts such an attitude in us, because of the kinship libido. So it is as Pseudo-Democritus says: "Nature rejoices in nature, nature conquers nature, nature rules over nature."[10] Man's instincts are not all harmoniously arranged, they are perpetually jostling each other out of the way. The ancients were optimistic enough to see this struggle not as a chaotic muddle but as aspiring to some higher order.

[470] Thus the encounter with anima and animus means conflict and brings us up against the hard dilemma in which nature herself has placed us. Whichever course one takes, nature will be mortified and must suffer, even to the death; for the merely natural man must die in part during his own lifetime. The Christian symbol of the crucifix is therefore a prototype and an "eternal" truth. There are medieval pictures showing how Christ is nailed to the Cross by his own virtues. Other people meet the same fate at the hands of their vices. Nobody who finds himself on the road to wholeness can escape that characteristic suspension which is the meaning of crucifixion. For he will infallibly run into things that thwart and "cross" him: first, the thing he has no wish to be (the shadow); second, the thing he is not (the "other," the individual reality of the "You"); and third, his psychic non-ego (the collective unconscious). This being at cross purposes with ourselves is suggested by the crossed branches held by the king and queen, who are themselves man's cross in the form of the anima and woman's cross in the form of the animus. The meeting with the collective unconscious is a fatality of which the natural

man has no inkling until it overtakes him. As Faust says: “You are conscious only of the single urge/O may you never know the other!”

[471] This process underlies the whole *opus*, but to begin with it is so confusing that the alchemist tries to depict the conflict, death, and rebirth figuratively, on a higher plane, first—in his *practica*— in the form of chemical transformations and then—in his *theoria*— in the form of conceptual images. The same process may also be conjectured to underlie certain religious *opera*, since notable parallels exist between ecclesiastical symbolism and alchemy. In psychotherapy and in the psychology of neuroses it is recognized as the psychic process par excellence, because it typifies the content of the transference neurosis. The supreme aim of the *opus psychologicum* is conscious realization, and the first step is to make oneself conscious of contents that have hitherto been projected. This endeavour gradually leads to knowledge of one’s partner and to self-knowledge, and so to the distinction between what one really is and what is projected into one, or what one imagines oneself to be. Meanwhile, one is so taken up with one’s own efforts that one is hardly conscious of the extent to which “nature” acts not only as a driving-force but as a helper—in other words, how much instinct insists that the higher level of consciousness be attained. This urge to a higher and more comprehensive consciousness fosters civilization and culture, but must fall short of the goal unless man voluntarily places himself in its service. The alchemists are of the opinion that the *artifex* is the servant of the work, and that not he but nature brings the work to fruition. All the same, there must be will as well as ability on man’s part, for unless both are present the urge remains at the level of merely natural symbolism and produces nothing but a perversion of the instinct for wholeness which, if it is to fulfil its purpose, needs all parts of the whole, including those that are projected into a “You.” Instinct seeks them there, in order to re-create that royal pair which every human being has in his wholeness, i.e., that bisexual First Man who has “no need of anything but himself.” Whenever this drive for wholeness appears, it begins by disguising itself under the symbolism of incest, for, unless he seeks it in himself, a man’s nearest feminine counterpart is to be found in his mother, sister, or daughter.

[472] With the integration of projections—which the merely natural man in his unbounded naïveté can never recognize as such—the personality becomes so vastly enlarged that the normal ego-personality is almost extinguished. In other words, if the individual identifies himself with the contents awaiting integration, a positive or negative inflation results. Positive inflation comes very near to a more or less conscious megalomania; negative inflation is felt as an annihilation of the ego. The two conditions may alternate. At all events the integration of contents that were always unconscious and projected involves a serious lesion of the ego. Alchemy expresses this through the symbols of death, mutilation, or poisoning, or through the curious idea of dropsy, which in the "Aenigma Merlini"[11] is represented as the king's desire to drink inordinate quantities of water. He drinks so much that he melts away and has to be cured by the Alexandrian physicians.[12] He suffers from a surfeit of the unconscious and becomes dissociated—"ut mihi videtur omnia membra mea ab invicem dividuntur" (so that all my limbs seem divided one from another).[13] As a matter of fact, even Mother Alchemia is dropsical in her lower limbs.[14] In alchemy, inflation evidently develops into a psychic oedema.[15]

[473] The alchemists assert that death is at once the conception of the *filius philosophorum*, a peculiar variation of the doctrine of the Anthropos.[16] Procreation through incest is a royal or divine prerogative whose advantages the ordinary man is forbidden to enjoy. The ordinary man is the natural man, but the king or hero is the "supernatural" man, the *pneumatikos* who is "baptized with spirit and water," i.e., begotten in the *aqua benedicta* and born from it. He is the Gnostic Christ who descends upon the man Jesus during his baptism and departs from him again before the end. This "son" is the new man, the product of the union of king and queen—though here he is not born of the queen, but queen and king are themselves transformed into the new birth.[17]

[474] Translated into the language of psychology, the mythologem runs as follows: the union of the conscious mind or egopersonality with the unconscious personified as anima produces a new personality compounded of both—"ut duo qui fuerant, unum quasi corpore fiant."

Not that the new personality is a third thing midway between conscious and unconscious, it is both together. Since it transcends consciousness it can no longer be called "ego" but must be given the name of "self." Reference must be made here to the Indian idea of the atman, whose personal and cosmic modes of being form an exact parallel to the psychological idea of the self and the *filius philosophorum*.[18] The self too is both ego and non-ego, subjective and objective, individual and collective. It is the "uniting symbol" which epitomizes the total union of opposites.[19] As such and in accordance with its paradoxical nature, it can only be expressed by means of symbols. These appear in dreams and spontaneous fantasies and find visual expression in the mandalas that occur in the patient's dreams, drawings, and paintings. Hence, properly understood, the self is not a doctrine or theory but an image born of nature's own workings, a natural symbol far removed from all conscious intention. I must stress this obvious fact because certain critics still believe that the manifestations of the unconscious can be written off as pure speculation. But they are matters of observed fact, as every doctor knows who has to deal with such cases. The integration of the self is a fundamental problem which arises in the second half of life. Dream symbols having all the characteristics of mandalas may occur long beforehand without the development of the inner man becoming an immediate problem. Isolated incidents of this kind can easily be overlooked, so that it then seems as if the phenomena I have described were rare curiosities. They are in fact nothing of the sort; they occur whenever the individuation process becomes the object of conscious scrutiny, or where, as in the psychoses, the collective unconscious peoples the conscious mind with archetypal figures.

7

THE ASCENT OF THE SOUL

Here is the division of the four elements/
As from the lifeless corpse the soul ascends.

[*Figure 7*]

[475] This picture carries the *putrefactio* a stage further. Out of the decay the soul mounts up to heaven. Only *one* soul departs from the two, for the two have indeed become one. This brings out the nature of the soul as a *vinculum* or *ligamentum:* it is a function of relationship. As in real death, the soul departs from the body and returns to its heavenly source. The One born of the two represents the metamorphosis of both, though it is not yet fully developed and is still a "conception" only. Yet, contrary to the usual meaning of conception, the soul does not come down to animate the body, but leaves the body and mounts heavenwards. The "soul" evidently represents the *idea* of unity which has still to become a concrete fact and is at present only a potentiality. The idea of a wholeness made up of *sponsus* and *sponsa* has its correlate in the *rotundus globus coelestis*.[1]

[476] This picture corresponds psychologically to a dark state of disorientation. The decomposition of the elements indicates dissociation and the collapse of the existing ego-consciousness. It is closely analogous to the schizophrenic state, and it should be taken very seriously because this is the moment when latent psychoses may become acute, i.e., when the patient becomes aware of the collective unconscious and the psychic non-ego. This collapse and disorientation of consciousness may last a considerable time and it is one of the most difficult transitions the analyst has to deal with, demanding the greatest patience, courage, and faith on the part of both doctor and patient. It is a sign that the patient is being driven along willy-nilly without any sense of direction, that, in the truest sense of the word, he is in an utterly *soulless* condition, exposed to the full force of autoerotic affects and fantasies. Referring to this state of deadly darkness, one alchemist says: "Hoc est ergo magnum signum, in

cuius investigatione nonnulli perierunt” (This is a great sign, in the investigation of which not a few have perished).[2]

[477] This critical state, when the conscious mind is liable to be submerged at any moment in the unconscious, is akin to the “loss of soul” that frequently attacks primitives. It is a sudden *abaissement du niveau mental*, a slackening of the conscious tension, to which primitive man is especially prone because his consciousness is still relatively weak and means a considerable effort for him. Hence his lack of will-power, his inability to concentrate and the fact that, mentally, he tires so easily, as I have experienced to my cost during palavers. The widespread practice of yoga and dhyana in the East is a similar *abaissement* deliberately induced for the purpose of relaxation, a technique for releasing the soul. With certain patients, I have even been able to establish the existence of subjectively experienced levitations in moments of extreme derangement.[3] Lying in bed, the patients felt that they were floating horizontally in the air a few feet above their bodies. This is a suggestive reminder of the phenomenon called the “witch’s trance,” and also of the parapsychic levitations reported of many saints.

[478] The corpse in our picture is the residue of the past and represents the man who is no more, who is destined to decay. The “torments” which form part of the alchemist’s procedure belong to this stage of the *iterum mori*— the reiterated death. They consist in “membra secare, arctius sequestrare ac partes mortificare et in naturam, quae in eo [lapide] est, vertere” (cutting up the limbs, dividing them into smaller and smaller pieces, mortifying the parts, and changing them into the nature which is in [the stone]), as the *Rosarium* says, quoting from Hermes. The passage continues: “You must guard the water and fire dwelling in the arcane substance and contain those waters with the permanent water, even though this be no water, but the fiery form of the true water.”[4] For the precious substance, the soul, is in danger of escaping from the bubbling solution in which the elements are decomposed. This precious substance is a paradoxical composite of fire and water, i.e., Mercurius, the *servus* or *cervus fugitivus* who is ever about to flee—or who, in other words, resists integration (into consciousness). He has to be “contained” by the “water,”

whose paradoxical nature corresponds to the nature of Mercurius and actually contains him within itself. Here we seem to have a hint about the treatment required: faced with the disorientation of the patient, the doctor must hold fast to his own orientation; that is, he must know what the patient’s condition means, he must understand what is of value in the dreams, and do so moreover with the help of that *aqua doctrinae* which alone is appropriate to the nature of the unconscious. In other words, he must approach his task with views and ideas capable of grasping unconscious symbolism. Intellectual or supposedly scientific theories are not adequate to the nature of the unconscious, because they make use of a terminology which has not the slightest affinity with its pregnant symbolism. The waters must be drawn together and held fast by the one water, by the *forma ignea verae aquae*. The kind of approach that makes this possible must therefore be plastic and symbolical, and itself the outcome of personal experience with unconscious contents. It should not stray too far in the direction of abstract intellectualism; hence we are best advised to remain within the framework of traditional mythology, which has already proved comprehensive enough for all practical purposes. This does not preclude the satisfaction of theoretical requirements, but these should be reserved for the private use of the doctor.

De

Figure 7

[479] Therapy aims at strengthening the conscious mind, and whenever possible I try to rouse the patient to mental activity and get him to subdue the *massa confusa* of his mind with his own understanding,[5] so that he can reach a vantage-point *au-dessus de la mêlée*. Nobody who ever had any wits is in danger of losing them in the process, though there are people who never knew till then what their wits are for. In such a situation, understanding acts like a life-saver. It integrates the unconscious, and gradually there comes into being a higher point of view where both conscious and unconscious are represented. It then proves that the invasion by the unconscious was rather like the flooding of the Nile: it increases the fertility of the land. The panegyric addressed by the

Rosarium to this state is to be taken in that sense: “O natura benedicta et benedicta est tua operatio, quia de imperfecto facis perfectum cum vera putrefactione quae est nigra et obscura. Postea facis germinare novas res et diversas, cum tua viriditate facis diversos colores apparere.” (O blessed Nature, blessed are thy works, for that thou makest the imperfect to be perfect through the true putrefaction, which is dark and black. Afterwards thou makest new and multitudinous things to grow, causing with thy verdure the many colours to appear.)[6] It is not immediately apparent why this dark state deserves special praise, since the *nigredo* is universally held to be of a sombre and melancholy humour reminiscent of death and the grave. But the fact that medieval alchemy had connections with the mysticism of the age, or rather was itself a form of mysticism, allows us to adduce as a parallel to the *nigredo* the writings of St. John of the Cross[7] concerning the “dark night.” This author conceives the “spiritual night” of the soul as a supremely positive state, in which the invisible—and therefore dark—radiance of God comes to pierce and purify the soul.

[480] The appearance of the colours in the alchemical vessel, the so-called *cauda pavonis*, denotes the spring, the renewal of life—*post tenebras lux*. The text continues: “This blackness is called earth.” The Mercurius in whom the sun drowns is an earth-spirit, a *Deus terrenus*,[8] as the alchemists say, or the *Sapientia Dei* which took on body and substance in the creature by creating it. The unconscious is the spirit of chthonic nature and contains the archetypal images of the *Sapientia Dei*. But the intellect of modern civilized man has strayed too far in the world of consciousness, so that it received a violent shock when it suddenly beheld the face of its mother, the earth.

[481] The fact that the soul is depicted as a homunculus in our picture indicates that it is on the way to becoming the *filius regius*, the undivided and hermaphroditic First Man, the Anthropos. Originally he fell into the clutches of Physis, but now he rises again, freed from the prison of the mortal body. He is caught up in a kind of ascension, and, according to the *Tabula smaragdina*, unites himself with the “upper powers.” He is the essence of the “lower power” which, like the “third filiation” in the

doctrine of Basilides, is ever striving upwards from the depths,[9] not with the intention of staying in heaven, but solely in order to reappear on earth as a healing force, as an agent of immortality and perfection, as a mediator and saviour. The connection with the Christian idea of the Second Coming is unmistakable.

[482] The psychological interpretation of this process leads into regions of inner experience which defy our powers of scientific description, however unprejudiced or even ruthless we may be. At this point, unpalatable as it is to the scientific temperament, the idea of mystery forces itself upon the mind of the inquirer, not as a cloak for ignorance but as an admission of his inability to translate what he knows into the everyday speech of the intellect. I must therefore content myself with a bare mention of the archetype which is inwardly experienced at this stage, namely the birth of the “divine child” or—in the language of the mystics—the inner man.[10]

8

PURIFICATION

Here falls the heavenly dew, to lave/
The soiled black body in the grave.

[*Figure 8*]

[483] The falling dew is a portent of the divine birth now at hand. *Ros Gedeonis* (Gideon's dew)[1] is a synonym for the *aqua permanens*, hence for Mercurius.[2] A quotation from Senior at this point in the *Rosarium* text says: "Maria says again: 'But the water I have spoken of is a king descending from heaven, and the earth's humidity absorbs it, and the water of heaven is retained with the water of the earth, and the water of the earth honours that water with its lowliness and its sand, and water consorts with water and water will hold fast to water and Albira is whitened with Astuna.' "[3]

[484] The whitening (*albedo* or *dealbatio*) is likened to the *ortus solis*, the sunrise; it is the light, the illumination, that follows the darkness. Hermes says: "Azoth et ignis latonem abluunt et nigredinem ab eo auferunt" (Azoth and fire cleanse the lato and remove the blackness).[4] The spirit Mercurius descends in his heavenly form as *sapientia* and as the fire of the Holy Ghost, to purify the blackness. Our text continues: "Dealbate latonem et libros rumpite, ne corda vestra rumpantur.[5] Haec est enim compositio omnium Sapientum et etiam tertia pars totius operis.[6] Jungite ergo, ut dicitur in Turba, siccum humido: id est terram nigram cum aqua sua et coquite donee dealbatur. Sic habes aquam et terram per se et terram cum aqua dealbatam: ilia albedo dicitur aer." (Whiten the lato and rend the books lest your hearts be rent asunder.[5] For this is the synthesis of the wise and the third part of the whole *opus*[6] Join therefore, as is said in the *Turba*,[7] the dry to the moist, the black earth with its water, and cook till it whitens. In this manner you will have the essence of water and earth, having whitened the earth with water: but that whiteness is called air.) So that the reader may know that the "water" is the *aqua sapientiae*,

and the dew falling from heaven the divine gift of illumination and wisdom, there follows a long disquisition on Wisdom, entitled “Septimum Sapientiae Salomonis”:

> She it is that Solomon chose to have instead of light, and above all beauty and health; in comparison of her he compared not unto her the virtue of any precious stone. For all gold in her sight shall be esteemed as a little sand, and silver shall be counted as clay; and this is not without cause, for to gain her is better than the merchandise of silver and the most pure gold. And her fruit is more precious than all the riches of this world, and all the things that are desired are not to be compared with her. Length of days and health are in her right hand, and in her left hand glory and infinite riches. Her ways are beautiful operations and praiseworthy, not unsightly norill-favoured, and her paths are measured and not hasty,[8] but are bound up with stubborn and day-long toil. She is a tree of life to them that lay hold on her, and an unfailing light. Blessed shall they be who retain her, for the science of God shall never perish, as Alphidius beareth witness, for he saith: He who hath found this science, it shall be his rightful food for ever.[9]

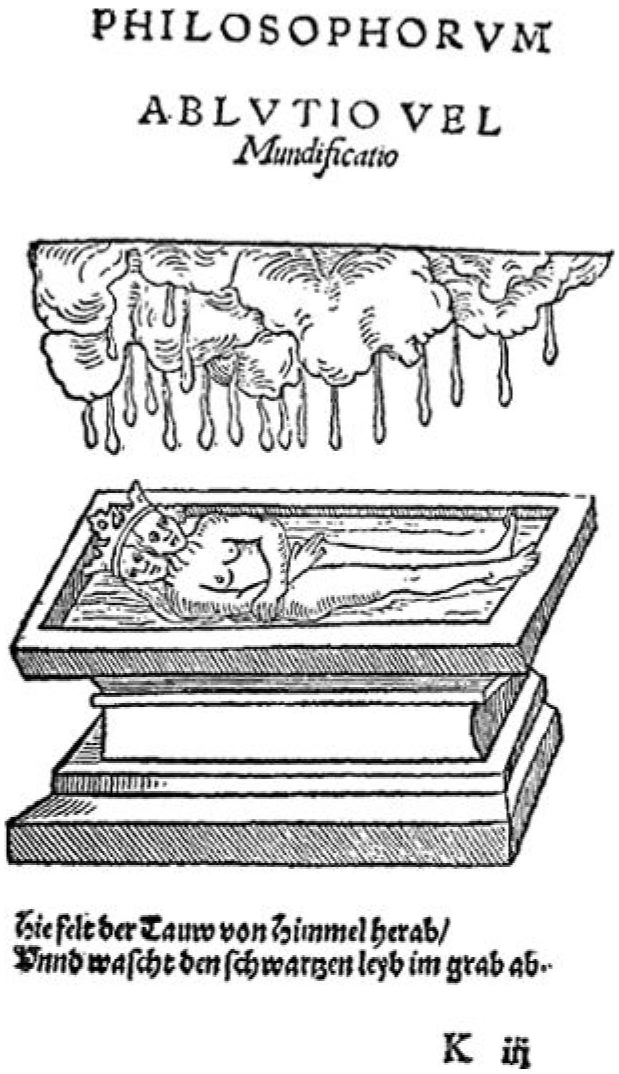

Figure 8

[485] In this connection I would like to point out that water as a symbol of wisdom and spirit can be traced back to the parable which Christ told to the Samaritan woman at the well.[10] The uses to which this parable was put can be seen in one of the sermons of Cardinal Nicholas of Cusa, a contemporary of our alchemists: “There is in Jacob’s well a water which human ingenuity has sought and found. Philosophy is its name, and it is found through laborious investigation of the world of the senses. But in the Word of God, which dwells in the depths of the living well of Christ’s humanity, there is a fountain for the refreshment of the spirit. Here, then, we have Jacob’s well of the senses, the well of reason and the well of wisdom. From the first well, which is of animal nature and deep, the

father drinks, together with his children and cattle; from the second, which is yet deeper and on the very margin of nature, there drink only the children of men, namely those whose reason has awakened and whom we call philosophers; from the third, the deepest of all, drink the sons of the All-Highest, whom we call gods and true theologians. Christ in his humanity may be called the deepest well.… In this deepest well is the source of wisdom, which brings bliss and immortality.… The living well bears the source of its own life, it calls the thirsty to the waters of salvation that they may be refreshed with the water of saving wisdom."[11] Another passage in the same sermon says: "Whosoever drinks the spirit, drinks of a bubbling spring."[12] Finally, Cusanus says: "Mark well, our reason is given to us with the power of an intellectual seed; wherefore it contains a welling principle through which it generates in itself the water of understanding. And this well can yield naught but water of a like nature, namely, the water of human understanding; just as the understanding of the principle 'every thing either is or is not' yields the metaphysical water from which the other streams of science flow without cease."[13]

[486] After all this there can be no more doubt that the black darkness is washed away by the *aqua sapientiae* of "our science," namely the God-given gift of the royal art and the knowledge it bestows. The *mundificatio* (purification) means, as we have seen, the removal of the superfluities that always cling to merely natural products, and especially to the symbolic unconscious contents which the alchemist found projected into matter. He therefore acted on Cardan's rule that the object of the work of interpretation is to reduce the dream material to its most general principles.[14] This is what the laboratory worker called the *extractio animae*, and what in the psychological field we would call the working through of the idea contained in the dream. We know that this requires a necessary premise or hypothesis, a certain intellectual structure by means of which "apperceptions" can be made. In the case of the alchemist, such a premise was ready to hand in the *aqua (doctrinae*), or the God-inspired *sapientia* which he could also acquire through a diligent study of the "books," the alchemical classics. Hence the reference to the books, which at this stage of the work must be avoided or destroyed "lest your hearts

be rent asunder.” This singular exhortation, altogether inexplicable from the chemical point of view, has a profound significance here. The atolvent water or *aqua sapientiae* had been established in the teachings and sayings of the masters as the *donum Spiritus Sancti* which enables the philosopher to understand the *miracula operis*. Therefore he might easily be tempted to assume that philosophical knowledge is the highest good, as the Cusanus quotation shows. The psychological equivalent of this situation is when people imagine that they have reached the goal of the work once the unconscious contents have been made conscious and theoretically evaluated. In both cases this would be arbitrarily to define “spirit” as a mere matter of thinking and intuition. Both disciplines, it is true, are aiming at a “spiritual” goal: the alchemist undertakes to produce a new, volatile (hence aerial or “spiritual”) entity endowed with *corpus, anima, et spiritus*, where *corpus* is naturally understood as a “subtle” body or “breath body”; the analyst tries to bring about a certain attitude or frame of mind, a certain “spirit” therefore. But because the body, even when conceived as the *corpus glorificationis*, is grosser than *anima* and *spiritus*, a “remnant of earth” necessarily clings to it, albeit a very subtle one.[15] Hence an attitude that seeks to do justice to the unconscious as well as to one’s fellow human beings cannot possibly rest on knowledge alone, in so far as this consists merely of thinking and intuition. It would lack the function that perceives values, i.e., feeling, as well as the *fonction du réel*, i.e., sensation, the sensible perception of reality.[16]

[487] Thus if books and the knowledge they impart are given exclusive value, man’s emotional and affective life is bound to suffer. That is why the purely intellectual attitude must be abandoned. “Gideon’s dew” is a sign of divine intervention, it is the moisture that heralds the return of the soul.

[488] The alchemists seem to have perceived the danger that the work and its realization may get stuck in one of the conscious functions. Consequently they stress the importance of the *theoria*, i.e., intellectual understanding as opposed to the *practica*, which consisted merely of chemical experiments. We might say that the *practica* corresponds to pure perception, and that this must be supplemented by apperception. But this second stage still does not bring complete realization. What is still

lacking is heart or feeling, which imparts an abiding value to anything we have understood. The books must therefore be "destroyed" lest thinking impair feeling and thus hinder the return of the soul.

[489] These difficulties are familiar ground to the psychotherapist. It often happens that the patient is quite satisfied with merely registering a dream or fantasy, especially if he has pretensions to aestheticism. He will then fight against even intellectual understanding because it seems an affront to the reality of his psychic life. Others try to understand with their brains only, and want to skip the purely practical stage. And when they have understood, they think they have done their full share of realization. That they should also have a *feeling-relationship* to the contents of the unconscious seems strange to them or even ridiculous. Intellectual understanding and aestheticism both produce the deceptive, treacherous sense of liberation and superiority which is liable to collapse if feeling intervenes. Feeling always binds one to the reality and meaning of symbolic contents, and these in turn impose binding standards of ethical behaviour from which aestheticism and intellectualism are only too ready to emancipate themselves.

[490] Owing to the almost complete lack of psychological differentiation in the age of alchemy, it is hardly surprising that such considerations as these are only hinted at in the treatises. But hints do exist, as we have seen. Since then the differentiation of the functions has increased apace, with the result that they have become more and more segregated from one another. Consequently it is very easy for the modern mind to get stuck in one or other of the functions and to achieve only an incomplete realization. It is hardly necessary to add that in time this leads to a neurotic dissociation. To this we owe the further differentiation of the individual functions as well as the discovery of the unconscious, but at the price of psychological disturbance. Incomplete realization explains much that is puzzling both in the individual and in the contemporary scene. It is a crucial matter for the psychotherapist, particularly for those who still believe that intellectual insight and routine understanding, or even mere recollection, are enough to effect a cure. The alchemists thought that the *opus* demanded not only laboratory work, the reading of books, meditation, and patience, but also love.

[491] Nowadays we would speak of “feeling-values” and of realization through feeling. One is often reminded of Faust’s shattering experience when he was shaken out of the “deadly dull rut” of his laboratory and philosophical work by the revelation that “feeling is all.” In this we can already see the modern man who has got to the stage of building his world on a single function and is not a little proud of his achievement. The medieval philosophers would certainly never have succumbed to the idea that the demands of feeling had opened up a new world. The pernicious and pathological slogan *l’art pour l’art* would have struck them as absurd, for when they contemplated the mysteries of nature, sensation, creation, thinking, cognition and feeling were all one to them. Their state of mind was not yet split up into so many different functions that each stage of the realization process would have needed a new chapter of life. The story of Faust shows how unnatural our condition is: it required the intervention of the devil—in anticipation of Steinach [17]—to transform the ageing alchemist into a young gallant and make him forget himself for the sake of the all-too-youthful feelings he had just discovered! That is precisely the risk modern man runs: he may wake up one day to find that he has missed half his life.

[492] Nor is realization through feeling the final stage. Although it does not really belong to this chapter, yet it might not be out of place to mention the fourth stage after the three already discussed, particularly since it has such a very pronounced symbolism in alchemy. This fourth stage is the anticipation of the *lapis*. The imaginative activity of the fourth function—intuition, without which no realization is complete—is plainly evident in this anticipation of a possibility whose fulfilment could never be the object of empirical experience at all: already in Greek alchemy it was called λίθος οὐ λίθος “the stone that is no stone.” Intuition gives outlook and insight; it revels in the garden of magical possibilities as if they were real. Nothing is more charged with intuitions than the *lapis philosophorum*. This keystone rounds off the work into an experience of the totality of the individual. Such an experience is completely foreign to our age, although no previous age has ever needed wholeness so much. It is abundantly clear that this is the prime problem confronting the art of psychic healing in our day, as a consequence of which we are now trying

to loosen up our rigid *psychologie à compartiments* by putting in a few communicating doors.

[493] After the ascent of the soul, with the body left behind in the darkness of death, there now comes an enantiodromia: the *nigredo* gives way to the *albedo*. The black or unconscious state that resulted from the union of opposites reaches the nadir and a change sets in. The falling dew signals resuscitation and a new light: the ever deeper descent into the unconscious suddenly becomes illumination from above. For, when the soul vanished at death, it was not lost; in that other world it formed the living counterpole to the state of death in this world. Its reappearance from above is already indicated by the dewy moisture. This dewiness partakes of the nature of the psyche, for ψυχή is cognate with ψυχρός (cold) and ψυχόω (to freshen and animate), while on the other hand dew is synonymous with the *aqua permanens*, the *aqua sapientiae*, which in turn signifies illumination through the realization of meaning. The preceding union of opposites has brought light, as always, out of the darkness of night, and by this light it will be possible to see what the real meaning of that union was.

9

THE RETURN OF THE SOUL

Here is the soul descending from on high/
To quick the corpse we strove to purify.

[*Figure 9*]

[494] Here the reconciler, the soul, dives down from heaven to breathe life into the dead body. The two birds at the bottom left of the picture represent the allegorical winged and wingless dragons in the form of fledged and unfledged birds.[1] This is one of the many synonyms for the double nature of Mercurius, who is both a chthonic and a pneumatic being. The presence of this divided pair of opposites means that although the hermaphrodite appears to be united and is on the point of coming alive, the conflict between them is by no means finally resolved and has not yet disappeared: it is relegated to the "left" and to the "bottom" of the picture, i.e., banished to the sphere of the unconscious. The fact that these still unintegrated opposites are represented theriomorphically (and not anthropomorphically as before) bears out this supposition.

[495] The text of the *Rosarium* continues with a quotation from Morienus: "Despise not the ash, for it is the diadem of thy heart." This ash, the inert product of incineration, refers to the dead body, and the admonition establishes a curious connection between body and heart which at that time was regarded as the real seat of the soul.[2] The diadem refers of course to the supremely kingly ornament. Coronation plays some part in alchemy—the *Rosarium*, for instance, has a picture[3] of the *Coronatio Mariae*, signifying the glorification of the white, moonlike (purified) body. The text then quotes Senior as follows: "Concerning the white tincture: When my beloved parents have tasted of life, have been nourished with pure milk and become drunk with my white substance, and have embraced each other in my bed, they shall bring forth the son of the moon, who will excel all his kindred. And when my beloved has drunk from the red rock sepulchre and tasted the maternal fount in matrimony, and has drunk with me of my red wine and lain with me in

my bed in friendship, then I, loving him and receiving his seed into my cell, shall conceive and become pregnant and when my time is come shall bring forth a most mighty son, who shall rule over and govern all the kings and princes of the earth, crowned with the golden crown of victory by the supreme God who liveth and reigneth for ever and ever."[4]

[496] The coronation picture that illustrates this text[5] proves that the resuscitation of the purified corpse is at the same time a glorification, since the process is likened to the crowning of the Virgin.[6] The allegorical language of the Church supports such a comparison. The connections of the Mother of God with the moon,[7] water, and fountains are so well known that I need not substantiate them further. But whereas it is the Virgin who is crowned here, in the Senior text it is the son who receives the "crown of victory"—which is quite in order since he is the *filius regius* who replaces his father. In *Aurora* the crown is given to the *regina austri,* Sapientia, who says to her beloved: "I am the crown wherewith my beloved is crowned," so that the crown serves as a connection between the mother and her son-lover.[8] In a later text[9] the *aqua amara* is defined as "crowned with light." At that time Isidore of Seville's etymology was still valid: *mare ab amaro,*[10] which vouches for "sea" as synonymous with the *aqua permanens*. It is also an allusion to the water symbolism of Mary (πηγή, "fountain").[11] Again and again we note that the alchemist proceeds like the unconscious in the choice of his symbols: every idea finds both a positive and a negative expression. Sometimes he speaks of a royal pair, sometimes of dog and bitch; and the water symbolism is likewise expressed in violent contrasts. We read that the royal diadem appears "in menstruo meretricis (in the menstruum of a whore),"[12] or the following instructions are given: "Take the foul deposit [*faecem*] that remains in the cooking-vessel and preserve it, for it is the crown of the heart." The deposit corresponds to the corpse in the sarcophagus, and the sarcophagus corresponds in turn to the mercurial fountain or the *vas hermeticum*.

Figure 9

[497] The soul descending from heaven is identical with the dew, the *aqua divina*, which, as Senior, quoting Maria, explains, is “Rex de coelo descendens.”[13] Hence this water is itself crowned and forms the “diadem of the heart,”[14] in apparent contradiction to the earlier statement that the ash was the diadem. It is difficult to tell whether the alchemists were so hopelessly muddled that they did not notice these flat contradictions, or whether their paradoxes were sublimely deliberate. I suspect it was a bit of both, since the *ignorantes, stulti, fatui* would take the texts at their face value and get bogged in the welter of analogies, while the more astute reader, realizing the necessity for symbolism, would handle it like a virtuoso with no trouble at all. Intellectual responsibility seems always to

have been the alchemists’ weak spot, though a few of them tell us plainly enough how we are to regard their peculiar language.[15] The less respect they showed for the bowed shoulders of the sweating reader, the greater was their debt, willing or unwilling, to the unconscious, for it is just the infinite variety of their images and paradoxes that points to a psychological fact of prime importance: the indefiniteness of the archetype with its multitude of meanings, all presenting different facets of a single, simple truth. The alchemists were so steeped in their inner experiences that their sole concern was to devise fitting images and expressions regardless of whether these were intelligible or not. Although in this respect they remained behind the times, they nevertheless performed the inestimable service of having constructed a phenomenology of the unconscious long before the advent of psychology. We, as heirs to these riches, do not find our heritage at all easy to enjoy. Yet we can comfort ourselves with the reflection that the old masters were equally at a loss to understand one another, or that they did so only with difficulty. Thus the author of the *Rosarium* says that the “antiqui Philosophi tam obscure quam confuse scripserunt,” so that they only baffled the reader or put him off altogether. For his part, he says, he would make the “experimentum verissimum” plain for all eyes to see and reveal it “in the most certain and human manner”—and then proceeds to write exactly like all the others before him. This was inevitable, as the alchemists did not really know what they were writing about. Whether we know today seems to me not altogether sure. At any rate we no longer believe that the secret lies in chemical substances, but that it is rather to be found in one of the darker and deeper layers of the psyche, although we do not know the nature of this layer. Perhaps in another century or so we shall discover a new darkness from which there will emerge something we do not understand either, but whose presence we sense with the utmost certainty.

[498] The alchemist saw no contradiction in comparing the diadem with a “foul deposit” and then, in the next breath, saying that it is of heavenly origin. He follows the rule laid down in the “Tabula smaragdina”: “Quod est inferius, est sicut quod est superius. Et quod est superius, est sicut quod est inferius.”[16] His faculty for conscious discrimination was not as

acute as modern man's, and was distinctly blunter than the scholastic thought of his contemporaries. This apparent regression cannot be explained by any mental backwardness on the part of the alchemist; it is more the case that his main interest is focussed on the unconscious itself and not at all on the powers of discrimination and formulation which mark the concise conceptual thinking of the schoolmen. He is content if he succeeds in finding expressions to delineate afresh the secret he feels. How these expressions relate to and differ from one another is of the smallest account to him, for he never supposes that anybody could reconstruct the art from his ideas about it, but that those who approach the art at all are already fascinated by its secret and are guided by sure intuition, or are actually elected and predestined thereto by God. Thus the *Rosarium*[17] says, quoting Hortulanus:[18] "Solus ille, qui scit facere lapidem Philosophorum, intelligit verba eorum de lapide" (Only he who knows how to make the philosophers' stone can understand their words concerning it). The darkness of the symbolism scatters before the eyes of the enlightened philosopher. Hortulanus says again: "Nihil enim prodest occultatio philosophorum in sermonibus, ubi doctrina Spiritus sancti operatur"[19] (The mystification in the sayings of the philosophers is of no avail where the teaching of the Holy Ghost is at work).

[499] The alchemist's failure to distinguish between *corpus* and *spiritus* is in our case assisted by the assumption that, owing to the preceding *mortificatio* and *sublimatio*, the body has taken on "quintessential" or spiritual form and consequently, as a *corpus mundum* (pure substance), is not so very different from spirit. It may shelter spirit or even draw it down to itself.[20] All these ideas lead one to conclude that not only the *coniunctio* but the reanimation of the "body" is an altogether transmundane event, a process occurring in the psychic non-ego. This would explain why the process is so easily projected, for if it were of a personal nature its liability to projection would be considerably reduced, because it could then be made conscious without too much difficulty. At any rate this liability would not have been sufficient to cause a projection upon inanimate matter, which is the polar opposite of the living psyche. Experience shows that the carrier of the projection is not just *any* object

but is always one that proves adequate to the nature of the content projected—that is to say, it must offer the content a “hook” to hang on.[21]

[500] Although the process is essentially transcendental, the projection brings it down to reality by violently affecting the conscious and personal psyche. The result is an inflation, and it then becomes clear that the *coniunctio* is a hierosgamos of the gods and not a mere love-affair between mortals. This is very subtly suggested in the *Chymical Wedding*, where Rosencreutz, the hero of the drama, is only a guest at the feast and, though forbidden to do so, slips into the bedchamber of Venus in order to gaze admiringly on the naked beauty of the sleeper. As a punishment for this intrusion Cupid wounds him in the hand with an arrow.[22] His own personal, secret connection with the royal marriage is only fleetingly indicated right at the end: the king, alluding to Rosencreutz, says that he (Rosencreutz) was his father.[23] Andreae, the author, must have been a man of some wit, since at this point he tries to extricate himself from the affair with a jest. He gives a clear hint that he himself is the father of his characters and gets the king to confirm this. The voluntarily proffered information about the paternity of this “child” is the familiar attempt of a creative artist to bolster up the prestige of his ego against the suspicion that he is the victim of the creative urge welling out of the unconscious. Goethe could not shake off the grip of *Faust*— his “main business” — half so easily. (Lesser men have correspondingly more need of greatness, hence they must make others think more highly of them.) Andreae was as fascinated by the secret of the art as any alchemist; the serious attempt he made to found the Rosicrucian Order is proof of this, and it was largely for reasons of expediency, owing to his position as a cleric, that he was led to adopt a more distant attitude in later years.[24]

[501] If there is such a thing as an unconscious that is not personal—i.e., does not consist of individually acquired contents, whether forgotten, subliminally perceived, or repressed—then there must also be processes going on in this non-ego, spontaneous archetypal events which the conscious mind can only perceive when they are projected. They are immemorially strange and unknown, and yet we seem to have known them from everlasting; they are also the source of a remarkable

fascination that dazzles and illuminates at once. They draw us like a magnet and at the same time frighten us; they manifest themselves in fantasies, dreams, hallucinations, and in certain kinds of religious ecstasy.[25] The *coniunctio* is one of these archetypes. The absorptive power of the archetype explains not only the widespread incidence of this motif but also the passionate intensity with which it seizes upon the individual, often in defiance of all reason and understanding. To the *peripeteia* of the *coniunctio* also belong the processes illustrated in the last few pictures. They deal with the after-effects of the fusion of opposites, which have involved the conscious personality in their union. The extreme consequence of this is the dissolution of the ego in the unconscious, a state resembling death. It results from the more or less complete identification of the ego with unconscious factors, or, as we would say, from contamination. This is what the alchemists experienced as *immunditia,* pollution. They saw it as the defilement of something transcendent by the gross and opaque body which had for that reason to undergo sublimation. But the body, psychologically speaking, is the expression of our individual and conscious existence, which, we then feel, is in danger of being swamped or poisoned by the unconscious. We therefore try to separate the ego-consciousness from the unconscious and free it from that perilous embrace. Yet, although the power of the unconscious is feared as something sinister, this feeling is only partially justified by the facts, since we also know that the unconscious is capable of producing beneficial effects. The kind of effect it will have depends to a large extent on the attitude of the conscious mind.

[502] Hence the *mundificatio*— purification—is an attempt to discriminate the mixture, to sort out the *coincidentia oppositorum* in which the individual has been caught. The rational man, in order to live in this world, has to make a distinction between “himself” and what we might call the “eternal man.” Although he is a unique individual, he also stands for “man” as a species, and thus he has a share in all the movements of the collective unconscious. In other words, the “eternal” truths become dangerously disturbing factors when they suppress the unique ego of the individual and live at his expense. If our psychology is forced, owing to the special nature of its empirical material, to stress the importance of the

unconscious, that does not in any way diminish the importance of ego-consciousness. It is merely the one-sided over-valuation of the latter that has to be checked by a certain relativization of values. But this relativization should not be carried so far that the ego is completely fascinated and overpowered by the archetypal truths. The ego lives in space and time and must adapt itself to their laws if it is to exist at all. If it is absorbed by the unconscious to such an extent that the latter alone has the power of decision, then the ego is stifled, and there is no longer any medium in which the unconscious could be integrated and in which the work of realization could take place. The separation of the empirical ego from the "eternal" and universal man is therefore of vital importance, particularly today, when mass-degeneration of the personality is making such threatening strides. Mass-degeneration does not come only from without: it also comes from within, from the collective unconscious. Against the outside, some protection was afforded by the *droits de l'homme* which at present are lost to the greater part of Europe,[26] and even where they are not actually lost we see political parties, as naïve as they are powerful, doing their best to abolish them in favour of the slave state, with the bait of social security. Against the daemonism from within, the Church offers some protection so long as it wields authority. But protection and security are only valuable when not excessively cramping to our existence; and in the same way the superiority of consciousness is desirable only if it does not suppress and shut out too much life. As always, life is a voyage between Scylla and Charybdis.

[503] The process of differentiating the ego from the unconscious,[27] then, has its equivalent in the *mundificatio*, and, just as this is the necessary condition for the return of the soul to the body, so the body is necessary if the unconscious is not to have destructive effects on the ego-consciousness, for it is the body that gives bounds to the personality. The unconscious can be integrated only if the ego holds its ground. Consequently, the alchemist's endeavour to unite the *corpus mundum*, the purified body, with the soul is also the endeavour of the psychologist once he has succeeded in freeing the ego-consciousness from contamination with the unconscious. In alchemy the purification is the result of numerous distillations; in psychology too it comes from an

equally thorough separation of the ordinary ego-personality from all inflationary admixtures of unconscious material. This task entails the most painstaking self-examination and self-education, which can, however, be passed on to others by one who has acquired the discipline himself. The process of psychological differentiation is no light work; it needs the tenacity and patience of the alchemist, who must purify the body from all superfluities in the fiercest heat of the furnace, and pursue Mercurius "from one bride chamber to the next." As alchemical symbolism shows, a radical understanding of this kind is impossible without a human partner. A general and merely academic "insight into one's mistakes" is ineffectual, for then the mistakes are not really seen at all, only the idea of them. But they show up acutely when a human relationship brings them to the fore and when they are noticed by the other person as well as by oneself. Then and then only can they really be felt and their true nature recognized. Similarly, confessions made to one's secret self generally have little or no effect, whereas confessions made to another are much more promising.

[504] The "soul" which is reunited with the body is the One born of the two, the *vinculum* common to both.[28] It is therefore the very essence of relationship. Equally the psychological anima, as representative of the collective unconscious, has a collective character. The collective unconscious is a natural and universal datum and its manifestation always causes an unconscious identity, a state of *participation mystique*. If the conscious personality becomes caught up in it and offers no resistance, the relationship is personified by the anima (in dreams, for instance), who then, as a more or less autonomous part of the personality, generally has a disturbing effect. But if, as the result of a long and thorough analysis and the withdrawal of projections, the ego has been successfully separated from the unconscious, the anima will gradually cease to act as an autonomous personality and will become a function of relationship between conscious and unconscious. So long as she is projected she leads to all sorts of illusions about people and things and thus to endless complications. The withdrawal of projections makes the anima what she originally was: an archetypal image which, in its right place, functions to the advantage of the individual. Interposed between

the ego and the world, she acts like an ever-changing Shakti, who weaves the veil of Maya and dances the illusion of existence. But, functioning between the ego and the unconscious, the anima becomes the matrix of all the divine and semi-divine figures, from the pagan goddess to the Virgin, from the messenger of the Holy Grail to the saint.[29]The unconscious anima is a creature without relationships, an autoerotic being whose one aim is to take total possession of the individual. When this happens to a man he becomes strangely womanish in the worst sense, with a moody and uncontrolled disposition which, in time, has a deleterious effect even on the hitherto reliable functions—e.g., his intellect—and gives rise to the kind of ideas and opinions we rightly find so objectionable in animus-possessed women.[30]

[505] Here I must point out that very different rules apply in feminine psychology, since in this case we are not dealing with a function of relationship but, on the contrary, with a *discriminative* function, namely the animus. Alchemy was, as a philosophy, mainly a masculine preoccupation and in consequence of this its formulations are for the most part masculine in character. But we should not overlook the fact that the feminine element in alchemy is not so inconsiderable since, even at the time of its beginnings in Alexandria, we have authentic proof of female philosophers like Theosebeia,[31] the *soror mystica* of Zosimos, and Paphnutia and Maria Prophetissa. From later times we know of the pair of alchemists, Nicolas Flamel and his wife Peronelle. The *Mutus liber* of 1677 gives an account of a man and wife performing the *opus* together,[32] and finally in the nineteenth century we have the pair of English alchemists, Thomas South and his daughter, who later became Mrs. Atwood. After busying themselves for many years with the study of alchemy, they decided to set down their ideas and experiences in book form. To this end they separated, the father working in one part of the house and his daughter in another. She wrote a thick, erudite tome while he versified. She was the first to finish and promptly sent the book to the printer. Scarcely had it appeared when her father was overcome with scruples, fearing lest they had betrayed the great secret. He succeeded in persuading his daughter to withdraw the book and destroy it. In the same spirit, he sacrificed his own poetic labours. Only a few lines are

preserved in her book, of which it was too late to withdraw all the copies. A reprint,[33] prepared after her death in 1910, appeared in 1918. I have read the book: no secrets are betrayed. It is a thoroughly medieval production garnished with would-be theosophical explanations as a sop to the syncretism of the new age.

[506] A remarkable contribution to the role of feminine psychology in alchemy is furnished by the letter which the English theologian and alchemist, John Pordage,[34] wrote to his *soror mystica* Jane Leade. In it[35] he gives her spiritual instruction concerning the *opus:*

[507] This sacred furnace, this *Balneum Mariae*, this glass phial, this secret furnace, is the place, the matrix or womb, and the centre from which the divine Tincture flows forth from its source and origin. Of the place or abode where the Tincture has its home and dwelling I need not remind you, nor name its name, but I exhort you only to knock at the foundation. Solomon tells us in his Song that its inner dwelling its not far from the navel, which resembles a round goblet filled with the sacred liquor of the pure Tincture.[36] You know the fire of the philosophers, it was the key they kept concealed.… The fire is the love-fire, the life that flows forth from the Divine Venus, or the Love of God; the fire of Mars is too choleric, too sharp, and too fierce, so that it would dry up and burn the *materia:* wherefore the love-fire of Venus alone has the qualities of the right true fire.

[508] This true philosophy will teach you how you should know yourself, and if you know yourself rightly, you will also know the pure nature; for the pure nature is in yourself. And when you know the pure nature which is your true selfhood, freed from all wicked, sinful selfishness, then also you will know God, for the Godhead is concealed and wrapped in the pure nature like a kernel in the nutshell.… The true philosophy will teach you who is the father and who is the mother of this magical child.… The father of this child is Mars, he is the fiery life which proceeds from Mars as the father's quality. His mother is Venus, who is the gentle love-fire proceeding from the son's quality. Here then, in the qualities and forms of nature, you see male and female, man and wife, bride and bridegroom, the first marriage or wedding of Galilee, which is celebrated between

Mars and Venus when they return from their fallen state. Mars, or the husband, must become a godly man, otherwise the pure Venus will take him neither into the conjugal nor into the sacred marriage bed. Venus must become a pure virgin, a virginal wife, otherwise the wrathful jealous Mars in his wrath-fire will not wed with her nor live with her in union; but instead of agreement and harmony, there will be naught but strife, jealousy, discord, and enmity among the qualities of nature.…

[509] Accordingly, if you think to become a learned artist, look with earnestness to the union of your own Mars and Venus, that the nuptial knot be rightly tied and the marriage between them well and truly consummated. You must see to it that they lie together in the bed of their union and live in sweet harmony; then the virgin Venus will bring forth her pearl, her water-spirit, in you, to soften the fiery spirit of Mars, and the wrathful fire of Mars will sink quite willingly, in mildness and love, into the love-fire of Venus, and thus both qualities, *as fire and water,* will mingle together, agree, and flow into one another; and from their agreement and union there will proceed the first conception of the magical birth which we call Tincture, the love-fire Tincture. Now although the Tincture is conceived in the womb of your humanity and is awakened to life, yet there is still a great danger, and it is to be feared that, because it is still in the body or womb, it may yet be spoiled by neglect before it be brought in due season into the light. On this account you must look round for a good nurse, who will watch it in its childhood and will tend it properly: and such must be your own pure heart and your own virginal will.…

[510] This child, this tincturing life, must be assayed, proved, and tried in the qualities of nature; and here again great anxiety and danger will arise, seeing that it must suffer the damage of temptation in the body and womb, and you may thus lose the birth. For the delicate Tincture, this tender child of life, must descend into the forms and qualities of nature, that it may suffer and endure temptation and overcome it; it must needs descend into the Divine Darkness, into the darkness of Saturn, wherein no light of life is to be seen: there it must be held captive, and be bound with the chains of darkness, and must live from the food which the prickly Mercurius will give it to eat, which to the Divine Tincture of life

is naught but dust and ashes, poison and gall, fire and brimstone. It must enter into the fierce wrathful Mars, by whom (as happened to Jonah in the belly of hell) it is swallowed, and must experience the curse of God's wrath; also it must be tempted by Lucifer and the million devils who dwell in the quality of the wrathful fire. And here the divine artist in this philosophical work will see the first colour, where the Tincture appears in its blackness, and it is the blackest black; the learned philosophers call it their black crow, or their black raven, or again their blessed and blissful black; for in the darkness of this black is hidden the light of lights in the quality of Saturn; and in this poison and gall there is hidden in Mercurius the most precious medicament against the poison, namely the life of life. And the blessed Tincture is hidden in the fury or wrath and curse of Mars.

[511] Now it seems to the artist that all his work is lost. What has become of the Tincture? Here is nothing that is apparent, that can be perceived, recognized, or tasted, but darkness, most painful death, a hellish fearful fire, nothing but the wrath and curse of God; yet he does not see that the Tincture of Life is in this putrefaction or dissolution and destruction, that there is light in this darkness, life in this death, love in this fury and wrath, and in this poison the highest and most precious Tincture and medicament against all poison and sickness.

[512] The old philosophers named this work or labour their descension, their cineration, their pulverization, their death, their putrefaction of the *materia* of the stone, their corruption, their *caput mortuum*. You must not despise this blackness, or black colour, but persevere in it in patience, in suffering, and in silence, until its forty days of temptation are over, until the days of its tribulations are completed, when the seed of life shall waken to life, shall rise up, sublimate or glorify itself, transform itself into whiteness, purify and sanctify itself, give itself the redness, in other words, transfigure and fix its shape. When the work is brought thus far, it is an easy work: for the learned philosophers have said that the making of the stone is then woman's work and child's play. Therefore, if the human will is given over and left, and becomes patient and still and as a dead nothing, the Tincture will do and effect everything in us and for us, if we can keep our thoughts, movements, and imaginations still, or can leave

off and rest. But how difficult, hard, and bitter this work appears to the human will, before it can be brought to this shape, so that it remains still and calm even though all the fire be let loose in its sight, and all manner of temptations assail it!

[513] Here, as you see, there is great danger, and the Tincture of life can easily be spoiled and the fruit wasted in the womb, when it is thus surrounded on all sides and assailed by so many devils and so many tempting essences. But if it can withstand and overcome this fiery trial and sore temptation, and win the victory: then you will see the beginning of its resurrection from hell, death, and the mortal grave, appearing first in the quality of Venus; and then the Tincture of life will itself burst forth mightily from the prison of the dark Saturn, through the hell of the poisonous Mercurius, and through the curse and direful death of God's wrath that burns and flames in Mars, and the gentle love-fire of the Venus quality will gain the upper hand, and the love-fire Tincture will be preferred in the government and have supreme command. And then the gentleness and love-fire of Divine Venus will reign as lord and king in and over all qualities.

[514] Nevertheless there is still another danger that the work of the stone may yet miscarry. Therefore the artist must wait until he sees the Tincture covered over with its other colour, as with the whitest white, which he may expect to see after long patience and stillness, and which truly appears when the Tincture rises up in the lunar quality: illustrious Luna imparts a beautiful white to the Tincture, the most perfect white hue and a brilliant splendour. And thus is the darkness transformed into light, and death into life. And this brilliant whiteness awakens joy and hope in the heart of the artist, that the work has gone so well and fallen out so happily. For now the white colour reveals to the enlightened eye of the soul cleanliness, innocence, holiness, simplicity, heavenly-mindedness, and righteousness, and with these the Tincture is henceforth clothed over and over as with a garment. She is radiant as the moon, beautiful as the dawn. Now the divine virginity of the tincturing life shines forth, and no spot or wrinkle nor any other blemish is to be seen.

[515] The old masters were wont to call this work their white swan, their albification, or making white, their sublimation, their distillation, their circulation, their purification, their separation, their sanctification, and their resurrection, because the Tincture is made white like a shining silver. It is sublimed or exalted and transfigured by reason of its many descents into Saturn, Mercurius, and Mars, and by its many ascents into Venus and Luna. This is the distillation, the *Balneum Mariae:* because the Tincture is purified in the qualities of nature through the many distillations of the water, blood, and heavenly dew of the Divine Virgin Sophia, and, through the manifold circulation in and out of the forms and qualities of nature, is made white and pure, like brilliantly polished silver. And all uncleanliness of the blackness, all death, hell, curse, wrath, and all poison which rise up out of the qualities of Saturn, Mercury, and Mars are separated and depart, wherefore they call it their separation, and when the Tincture attains its whiteness and brilliance in Venus and Luna they call it their sanctification, their purification and making white. They call it their resurrection, because the white rises up out of the black, and the divine virginity and purity out of the poison of Mercurius and out of the red fiery rage and wrath of Mars.…

[516] Now is the stone shaped, the elixir of life prepared, the love-child or the child of love born, the new birth completed, and the work made whole and perfect. Farewell! fall, hell, curse, death, dragon, beast, and serpent! Good night! mortality, fear, sorrow, and misery! For now redemption, salvation, and recovery of everything that was lost will again come to pass within and without, for now you have the great secret and mystery of the whole world; you have the Pearl of Love; you have the unchangeable eternal essence of Divine Joy from which all healing virtue and all multiplying power come, from which there actively proceeds the active power of the Holy Ghost. You have the seed of the woman who has trampled on the head of the serpent. You have the seed of the virgin and the blood of the virgin in one essence and quality.

[517] O wonder of wonders! You have the tincturing Tincture, the pearl of the virgin, which has three essences or qualities in one; it has body, soul, and spirit, it has fire, light, and joy, it has the Father’s quality, it has the Son’s quality, and has also the Holy Ghost’s quality, even all these three,

> in one fixed and eternal essence and being. This is the Son of the Virgin, this is her first-born, this is the noble hero, the trampler of the serpent, and he who casts the dragon under his feet and tramples upon him.… For now the Man of Paradise is become clear as a transparent glass, in which the Divine Sun shines through and through, like gold that is wholly bright, pure, and clear, without blemish or spot. The soul is henceforth a most substantial seraphic angel, she can make herself doctor, theologian, astrologer, divine magician, she can make herself whatsoever she will, and do and have whatsoever she will: for all qualities have but one will in agreement and harmony. And this same one will is God's eternal infallible will; and from henceforth the Divine Man is in his own nature become one with God.[37]

[518] This hymn-like myth of love, virgin, mother, and child sounds extremely feminine, but in reality it is an archetypal conception sprung from the masculine unconscious, where the Virgin Sophia corresponds to the anima (in the psychological sense).[38] As is shown by the symbolism and by the not very clear distinction between her and the son, she is also the "paradisal" or "divine" being, i.e., the self. The fact that these ideas and figures were still mystical for Pordage and more or less undifferentiated is explained by the emotional nature of the experiences which he himself describes.[39] Experiences of this kind leave little room for critical understanding. They do, however, throw light on the processes hidden behind the alchemical symbolism and pave the way for the discoveries of modern medical psychology. Unfortunately we possess no original treatises that can with any certainty be ascribed to a woman author. Consequently we do not know what kind of alchemical symbolism a woman's view would have produced. Nevertheless, modern medical practice tells us that the feminine unconscious produces a symbolism which, by and large, is compensatory to the masculine. In that case, to use Pordage's terms, the leitmotiv would not be gentle Venus but fiery Mars, not Sophia but Hecate, Demeter, and Persephone, or the matriarchal Kali of southern India in her brighter and darker aspects.[40]

[519] In this connection I would like to draw attention to the curious pictures of the *arbor philosophica* in the fourteenth-century Codex

Ashburnham.[41] One picture shows Adam struck by an arrow,[42] and the tree growing out of his genitals; in the other picture the tree grows out of Eve's head. Her right hand covers her genitals, her left points to a skull. Plainly this is a hint that the man's *opus* is concerned with the erotic aspect of the anima, while the woman's is concerned with the animus, which is a "function of the head."[43] The *prima materia*, i.e., the unconscious, is represented in man by the "unconscious" anima, and in woman by the "unconscious" animus. Out of the *prima materia* grows the philosophical tree, the unfolding *opus*. In their symbolical sense, too, the pictures are in accord with the findings of psychology, since Adam would then stand for the woman's animus who generates "philosophical" ideas with his member (λόγοι σπερματικοί), and Eve for the man's anima who, as Sapientia or Sophia, produces out of her head the intellectual content of the work.

[520] Finally, I must point out that a certain concession to feminine psychology is also to be found in the *Rosarium*, in so far as the first series of pictures is followed by a second—less complete, but otherwise analogous—series, at the end of which there appears a masculine figure, the "emperor," and not, as in the first, an "empress," the "daughter of the philosophers." The accentuation of the feminine element in the Rebis (Fig. 10) is consistent with a predominantly male psychology, whereas the addition of an "emperor" in the second version is a concession to woman (or possibly to the male consciousness).

[521] In its primary "unconscious" form the animus is a compound of spontaneous, unpremeditated opinions which exercise a powerful influence on the woman's emotional life, while the anima is similarly compounded of feelings which thereafter influence or distort the man's understanding ("she has turned his head"). Consequently the animus likes to project himself upon "intellectuals" and all kinds of "heroes," including tenors, artists, sporting celebrities, etc. The anima has a predilection for everything that is unconscious, dark, equivocal, and unrelated in woman, and also for her vanity, frigidity, helplessness, and so forth. In both cases the incest element plays an important part: there is a relation between the young woman and her father, the older woman and her son, the young man and his mother, the older man and his daughter.

[522] It will be clear from all this that the “soul” which accrues to ego-consciousness during the *opus* has a feminine character in the man and a masculine character in the woman. His anima wants to reconcile and unite; her animus tries to discern and discriminate. This strict antithesis is depicted in the alchemists’ Rebis, the symbol of transcendental unity, as a coincidence of opposites; but in conscious reality—once the conscious mind has been cleansed of unconscious impurities by the preceding *mundificatio*— it represents a conflict even though the conscious relations between the two individuals may be quite harmonious. Even when the conscious mind does not identify itself with the inclinations of the unconscious, it still has to face them and somehow take account of them in order that they may play their part in the life of the individual, however difficult this may be. For if the unconscious is not allowed to express itself through word and deed, through worry and suffering, through our consideration of its claims and resistance to them, then the earlier, divided state will return with all the incalculable consequences which disregard of the unconscious may entail. If, on the other hand, we give in to the unconscious too much, it leads to a positive or negative inflation of the personality. Turn and twist this situation as we may, it always remains an inner and outer conflict: one of the birds is fledged and the other not. We are always in doubt: there is a pro to be rejected and a contra to be accepted. All of us would like to escape from this admittedly uncomfortable situation, but we do so only to discover that what we left behind us was ourselves. To live in perpetual flight from ourselves is a bitter thing, and to live with ourselves demands a number of Christian virtues which we then have to apply to our own case, such as patience, love, faith, hope, and humility. It is all very fine to make our neighbour happy by applying them to him, but the demon of self-admiration so easily claps us on the back and says, “Well done!” And because this is a great psychological truth, it must be stood on its head for an equal number of people so as to give the devil something to carp at. But—does it make *us* happy when we have to apply these virtues to ourselves? when I am the recipient of my own gifts, the least among my brothers whom I must take to my bosom? when I must admit that I need all my patience, my love, my faith, and even my humility, and that I myself am my own devil, the antagonist who always wants the opposite

in everything? Can we ever really endure ourselves? “Do unto others…”—this is as true of evil as of good.

[523] In John Gower’s *Confessio amantis*[44] there is a saying which I have used as a motto to the Introduction of this book: “Bellica pax, vulnus dulce, suave malum” (a warring peace, a sweet wound, a mild evil). Into these words the old alchemist put the quintessence of his experience. I can add nothing to their incomparable simplicity and conciseness. They contain all that the ego can reasonably demand of the *opus,* and illuminate for it the paradoxical darkness of human life. Submission to the fundamental contrariety of human nature amounts to an acceptance of the fact that the psyche is at cross purposes with itself. Alchemy teaches that the tension is fourfold, forming a cross which stands for the four warring elements. The quaternio is the minimal aspect under which such a state of total opposition can be regarded. The cross as a form of suffering expresses psychic reality, and carrying the cross is therefore an apt symbol for the wholeness and also for the passion which the alchemist saw in his work. Hence the *Rosarium* ends, not unfittingly, with the picture of the risen Christ and the verses:

> After my many sufferings and great martyry
> I rise again transfigured, of all blemish free.

[524] An exclusively rational analysis and interpretation of alchemy, and of the unconscious contents projected into it, must necessarily stop short at the above parallels and antinomies, for in a total opposition there is no third—*tertium non daturl* Science comes to a stop at the frontiers of logic, but nature does not—she thrives on ground as yet untrodden by theory. *Venerabilis natura* does not halt at the opposites; she uses them to create, out of opposition, a new birth.

10

THE NEW BIRTH

Here is born the Empress of all honour/
The philosophers name her their daughter.
She multiplies/bears children ever again/
They are incorruptibly pure and without stain.

[*Figure 10*]

[525] Our last picture is the tenth in the series, and this is certainly no accident, for the denarius is supposed to be the perfect number.[1] We have shown that the axiom of Maria consists of 4, 3, 2, 1; the sum of these numbers is 10, which stands for unity on a higher level. The unarius represents unity in the form of the *res simplex*, i.e., God as *auctor rerum*,[2] while the denarius is the result of the completed work. Hence the real meaning of the denarius is the Son of God.[3] Although the alchemists call it the *filius philosophorum*,[4] they use it as a Christ-symbol and at the same time employ the symbolic qualities of the ecclesiastical Christ-figure to characterize their Rebis.[5] It is probably correct to say that the medieval Rebis had these Christian characteristics, but for the Hermaphroditus of Arabic and Greek sources we must conjecture a partly pagan tradition. The Church symbolism of *sponsus* and *sponsa* leads to the mystic union of the two, i.e., to the *anima Christi* which lives in the *corpus mysticum* of the Church. This unity underlies the idea of Christ's androgyny, which medieval alchemy exploited for its own ends. The much older figure of the Hermaphroditus, whose outward aspect probably derives from a Cyprian *Venus barbata*, encountered in the Eastern Church the already extant idea of an androgynous Christ, which is no doubt connected with the Platonic conception of the bisexual First Man, for Christ is ultimately the Anthropos.

PHILOSOPHORVM.

Hie iſt geboren die eddele Keyſerin reich/
Die meiſter nennen ſie jhrer dochter gleich.
Die vermeret ſich/gebiert kinder ohn zal/
Sein vndötlich rein/vnnd ohn alles mahl.

Die

Figure 10

[526] The denarius forms the *totius operis summa*, the culminating point of the work beyond which it is impossible to go except by means of the *multiplicatio*. For, although the denarius represents a higher stage of unity, it is also a multiple of 1 and can therefore be multiplied to infinity in the ratio of 10, 100, 1000, 10,000, etc., just as the mystical body of the Church is composed of an indefinitely large number of believers and is capable of multiplying that number without limit. Hence the Rebis is described as the *cibus sempiternus* (everlasting food), *lumen indeficiens*, and so forth; hence also the assumption that the tincture replenishes itself and that the work need only be completed once and for all time.[6] But,

since the *multiplicatio* is only an attribute of the denarius, 100 is no different from and no better than 10.[7]

[527] The *lapis*, understood as the cosmogonic First Man, is the *radix ipsius*, according to the *Rosarium*: everything has grown from this One and through this One.[8] It is the Uroboros, the serpent that fertilizes and gives birth to itself, by definition an *increatum*, despite a quotation from Rosarius to the effect that "Mercurius noster nobilissimus" was created by God as a "res nobilis." This *creatum increatum* can only be listed as another paradox. It is useless to rack our brains over this extraordinary attitude of mind. Indeed we shall continue to do so only while we assume that the alchemists were not being consciously and intentionally paradoxical. It seems to me that theirs was a perfectly natural view: anything unknowable could best be described in terms of opposites.[9] A longish poem in German, evidently written at about the time it was printed in the 1550 *Rosarium*, explains the nature of the Hermaphroditus as follows:

[528] Here is born the Empress of all honour/
The philosophers name her their daughter.
She multiplies/bears children ever again/
They are incorruptibly pure and without stain.
The Queen hates death and poverty
She surpasses gold silver and jewellery/
All medicaments great and small.
Nothing upon earth is her equal/
Wherefore we say thanks to God in heaven.
O force constrains me naked woman that I am/
For unblest was my body when I first began.
And never did I become a mother/
Until the time when I was born another.
Then the power of roots and herbs did I possess/
And I triumphed over all sickness.
Then it was that I first knew my son/
And we two came together as one.
There I was made pregnant by him and gave birth
Upon a barren stretch of earth.
I became a mother yet remained a maid/
And in my nature was establishèd.

Therefore my son was also my father/
As God ordained in accordance with nature.
I bore the mother who gave me birth/
Through me she was born again upon earth.
To view as one what nature hath wed/
Is in our mountain most masterfully hid.
Four come together in one/
In this our magisterial Stone.
And six when seen as a trinity/
Is brought to essential unity.
To him who thinks on these things aright/
God giveth the power to put to flight
All such sicknesses as pertain
To metals and the bodies of men.
None can do that without God’s help/
And then only if he see through himself.
Out of my earth a fountain flows/
And into two streams it branching goes.
One of them runs to the Orient/
The other towards the Occident.
Two eagles fly up with feathers aflame/
Naked they fall to earth again.
Yet in full feather they rise up soon/
That fountain is Lord of sun and moon.
O Lord Jesu Christ who bestow’st
The gift through the grace of thy Holy Ghost:
He unto whom it is given truly/
Understands the masters’ sayings entirely.
That his thoughts on the future life may dwell/
Body and soul are joined so well.
And to raise them up to their father’s kingdom/
Such is the way of art among men.

[529] This poem is of considerable psychological interest. I have already stressed the anima nature of the androgyne. The “unblessedness” of the “first body” has its equivalent in the disagreeable, daemonic, “unconscious” anima which we considered in the last chapter. At its second birth, that is, as a result of the opus, this anima becomes fruitful and is born together with her son, in the shape of the Hermaphroditus, the product of mother-son incest. Neither fecundation nor birth impairs her

virginity.[10] This essentially Christian paradox is connected with the extraordinary *timeless* quality of the unconscious: everything has already happened and is yet unhappened, is already dead and yet unborn.[11] Such paradoxical statements illustrate the potentiality of unconscious contents. In so far as comparisons are possible at all, they are objects of memory and knowledge, and in this sense belong to the remote past; we therefore speak of "vestiges of primordial mythological ideas." But, in so far as the unconscious manifests itself in a sudden incomprehensible invasion, it is something that was never there before, something altogether strange, new, and belonging to the future. The unconscious is thus the mother as well as the daughter, and the mother has given birth to her own mother (*increatum*), and her son was her father.[12] It seems to have dawned on the alchemists that this most monstrous of paradoxes was somehow connected with the self, for no man can practise such an art unless it be with God's help, and unless "he see through himself." The old masters were aware of this, as we can see from the dialogue between Morienus and King Kalid. Morienus relates how Hercules (the Byzantine Emperor Heraclius) told his pupils: "O sons of wisdom, know that God, the supreme and glorious Creator, has made the world out of four unequal elements and set man as an ornament between them." When the King begged for further explanation, Morienus answered: "Why should I tell you many things? For this substance [i.e., the arcanum] is extracted from you, and you are its ore; in you the philosophers find it, and, that I may speak more plainly, from you they take it. And when you have experienced this, the love and desire for it will be increased in you. And you shall know that this thing subsists truly and beyond all doubt.… For in this stone the four elements are bound together, and men liken it to the world and the composition of the world."[13]

[530] One gathers from this discourse that, owing to his position between the four world-principles, man contains within himself a replica of the world in which the unequal elements are united. This is the microcosm in man, corresponding to the "firmament" or "Olympus" of Paracelsus: that unknown quantity in man which is as universal and wide as the world itself, which is in him by nature and cannot be acquired. Psychologically, this corresponds to the collective unconscious, whose projections are to

be found everywhere in alchemy. I must refrain from adducing more proofs of the psychological insight of the alchemists, since this has already been done elsewhere.[14]

[531] The end of the poem hints at immortality—at the great hope of the alchemists, the *elixir vitae*. As a transcendental idea, immortality cannot be the object of experience, hence there is no argument either for or against. But immortality as an *experience of feeling* is rather different. A feeling is as indisputable a reality as the existence of an idea, and can be experienced to exactly the same degree. On many occasions I have observed that the spontaneous manifestations of the self, i.e., the appearance of certain symbols relating thereto, bring with them something of the timelessness of the unconscious which expresses itself in a feeling of eternity or immortality. Such experiences can be extraordinarily impressive. The idea of the *aqua permanens*, the *incorruptibilitas lapidis,* the *elixir vitae,* the *cibus immortalis,* etc., is not so very strange, since it fits in with the phenomenology of the collective unconscious.[15] It might seem a monstrous presumption on the part of the alchemist to imagine himself capable, even with God's help, of producing an everlasting substance. This claim gives many treatises an air of boastfulness and humbug on account of which they have deservedly fallen into disrepute and oblivion. All the same, we should beware of emptying out the baby with the bath water. There are treatises that look deep into the nature of the *opus* and put another complexion on alchemy. Thus the anonymous author of the *Rosarium* says: "It is manifest, therefore, that the stone is the master of the philosophers, as if he [the philosopher] were to say that he does of his own nature that which he is compelled to do; and so the philosopher is not the master, but rather the minister, of the stone. Consequently, he who attempts through the art and apart from nature to introduce into the matter anything which is not in it naturally, errs, and will bewail his error."[16] This tells us plainly enough that the artist does not act from his own creative whim, but is driven to act by the stone. This almighty taskmaster is none other than the self. The self wants to be made manifest in the work, and for this reason the *opus* is a process of individuation, a becoming of the self. The self is the total, timeless man and as such corresponds to the original,

spherical,[17] bisexual being who stands for the mutual integration of conscious and unconscious.

[532] From the foregoing we can see how the *opus* ends with the idea of a highly paradoxical being that defies rational analysis. The work could hardly end in any other way, since the *complexio oppositorum* cannot possibly lead to anything but a baffling paradox. Psychologically, this means that human wholeness can only be described in antinomies, which is always the case when dealing with a transcendental idea. By way of comparison, we might mention the equally paradoxical corpuscular theory and wave theory of light, although these do at least hold out the possibility of a mathematical synthesis, which the psychological idea naturally lacks. Our paradox, however, offers the possibility of an *intuitive* and *emotional* experience, because the unity of the self, unknowable and incomprehensible, irradiates even the sphere of our discriminating, and hence divided, consciousness, and, like all unconscious contents, does so with very powerful effects. This inner unity, or experience of unity, is expressed most forcibly by the mystics in the idea of the *unio mystica*, and above all in the philosophies and religions of India, in Chinese Taoism, and in the Zen Buddhism of Japan. From the point of view of psychology, the names we give to the self are quite irrelevant, and so is the question of whether or not it is "real." Its psychological reality is enough for all practical purposes. The intellect is incapable of knowing anything beyond that anyway, and therefore its Pilate-like questionings are devoid of meaning.

[533] To come back to our picture: it shows an apotheosis of the Rebis, the right side of the body being male, the left female. The figure stands on the moon, which in this case corresponds to the feminine lunar vessel, the *vas hermeticum*. Its wings betoken volatility, i.e., spirituality. In one hand it holds a chalice with three snakes in it, or possibly one snake with three heads; in the other, a single snake. This is an obvious allusion to the axiom of Maria and the old dilemma of 3 and 4, and also to the mystery of the Trinity. The three snakes in the chalice are the chthonic equivalent of the Trinity, and the single snake represents, firstly, the unity of the three as expressed by Maria and, secondly, the "sinister" *serpens Mercurialis* with all its subsidiary meanings.[18] Whether pictures of this

kind are in any way related to the Baphomet[19] of the Templars is an open question, but the snake symbolism[20] certainly points to the evil principle, which, although excluded from the Trinity, is yet somehow connected with the work of redemption. Moreover to the left of the Rebis we also find the raven, a synonym for the devil.[21] The unfledged bird has disappeared: its place is taken by the winged Rebis. To the right, there stands the “sun and moon tree,” the *arbor philosophica*, which is the conscious equivalent of the unconscious process of development suggested on the opposite side. The corresponding picture of the Rebis in the second version[22] has, instead of the raven, a pelican plucking its breast for its young, a well-known allegory of Christ. In the same picture a lion is prowling about behind the Rebis and, at the bottom of the hill on which the Rebis stands, there is the three-headed snake.[23] The alchemical hermaphrodite is a problem in itself and really needs special elucidation. Here I will say only a few words about the remarkable fact that the fervently desired goal of the alchemist’s endeavours should be conceived under so monstrous and horrific an image. We have proved to our satisfaction that the antithetical nature of the goal largely accounts for the monstrosity of the corresponding symbol. But this rational explanation does not alter the fact that the monster is a hideous abortion and a perversion of nature. Nor is this a mere accident undeserving of further scrutiny; it is on the contrary highly significant and the outcome of certain psychological facts fundamental to alchemy. The symbol of the hermaphrodite, it must be remembered, is one of the many synonyms for the goal of the art. In order to avoid unnecessary repetition I would refer the reader to the material collected in *Psychology and Alchemy*, and particularly to the lapis-Christ parallel, to which we must add the rarer and, for obvious reasons, generally avoided comparison of the *prima materia* with God.[24] Despite the closeness of the analogy, the *lapis* is not to be understood simply as the risen Christ and the *prima materia* as God; the *Tabula smaragdina* hints, rather, that the alchemical mystery is a “lower” equivalent of the higher mysteries, a sacrament not of the paternal “mind” but of maternal “matter.” The disappearance of theriomorphic symbols in Christianity is here compensated by a wealth of allegorical animal forms which tally quite well with *mater natura*.

Whereas the Christian figures are the product of spirit, light, and good, the alchemical figures are creatures of night, darkness, poison, and evil. These dark origins do much to explain the misshapen hermaphrodite, but they do not explain everything. The crude, embryonic features of this symbol express the immaturity of the alchemist's mind, which was not sufficiently developed to equip him for the difficulties of his task. He was underdeveloped in two senses: firstly he did not understand the real nature of chemical combinations, and secondly he knew nothing about the psychological problem of projection and the unconscious. All this lay as yet hidden in the womb of the future. The growth of natural science has filled the first gap, and the psychology of the unconscious is endeavouring to fill the second. Had the alchemists understood the psychological aspects of their work, they would have been in a position to free their "uniting symbol" from the grip of instinctive sexuality where, for better or worse, mere nature, unsupported by the critical intellect, was bound to leave it. Nature could say no more than that the combination of supreme opposites was a hybrid thing. And there the statement stuck, in sexuality, as always when the potentialities of consciousness do not come to the assistance of nature—which could hardly have been otherwise in the Middle Ages owing to the complete absence of psychology.[25] So things remained until, at the end of the nineteenth century, Freud dug up this problem again. There now ensued what usually happens when the conscious mind collides with the unconscious: the former is influenced and prejudiced in the highest degree by the latter, if not actually overpowered by it. The problem of the union of opposites had been lying there for centuries in its sexual form, yet it had to wait until scientific enlightenment and objectivity had advanced far enough for people to mention "sexuality" in scientific conversation. The sexuality of the unconscious was instantly taken with great seriousness and elevated to a sort of religious dogma, which has been fanatically defended right down to the present time: such was the fascination emanating from those contents which had last been nurtured by the alchemists. The natural archetypes that underlie the mythologems of incest, the hierosgamos, the divine child, etc., blossomed forth—in the age of science—into the theory of infantile sexuality, perversions, and incest, while the *coniunctio* was rediscovered in the transference neurosis.[26]

[534] The sexualism of the hermaphrodite symbol completely overpowered consciousness and gave rise to an attitude of mind which is just as unsavoury as the old hybrid symbolism. The task that defeated the alchemists presented itself anew: how is the profound cleavage in man and the world to be understood, how are we to respond to it and, if possible, abolish it? So runs the question when stripped of its natural sexual symbolism, in which it had got stuck only because the problem could not push its way over the threshold of the unconscious. The sexualism of these contents always denotes an unconscious identity of the ego with some unconscious figure (either anima or animus), and because of this the ego is obliged, willing and reluctant at once, to be a party to the hierosgamos, or at least to believe that it is simply and solely a matter of an erotic consummation. And sure enough it increasingly becomes so the more one believes it—the more exclusively, that is to say, one concentrates on the sexual aspect and the less attention one pays to the archetypal patterns. As we have seen, the whole question invites fanaticism because it is so painfully obvious that we are in the wrong. If, on the other hand, we decline to accept the argument that because a thing is fascinating it is the absolute truth, then we give ourselves a chance to see that the alluring sexual aspect is but one among many—the very one that deludes our judgment. This aspect is always trying to deliver us into the power of a partner who seems compounded of all the qualities we have failed to realize in ourselves. Hence, unless we prefer to be made fools of by our illusions, we shall, by carefully analysing every fascination, extract from it a portion of our own personality, like a quintessence, and slowly come to recognize that we meet ourselves time and again in a thousand disguises on the path of life. This, however, is a truth which only profits the man who is temperamentally convinced of the individual and irreducible reality of his fellow men.

[535] We know that in the course of the dialectical process the unconscious produces certain images of the *goal*. In *Psychology and Alchemy* I have described a long series of dreams which contain such images (including even a shooting target). They are mostly concerned with ideas of the

mandala type, that is, the circle and the quaternity. The latter are the plainest and most characteristic representations of the goal. Such images unite the opposites under the sign of the quaternio, i.e., by combining them in the form of a cross, or else they express the idea of wholeness through the circle or sphere. The superior type of personality may also figure as a goal-image, though more rarely. Occasionally special stress is laid on the luminous character of the centre. I have never come across the hermaphrodite as a personification of the goal, but more as a symbol of the initial state, expressing an identity with anima or animus.

[536] These images are naturally only anticipations of a wholeness which is, in principle, always just beyond our reach. Also, they do not invariably indicate a subliminal readiness on the part of the patient to realize that wholeness consciously, at a later stage; often they mean no more than a temporary compensation of chaotic confusion and lack of orientation. Fundamentally, of course, they always point to the self, the container and organizer of all opposites. But at the moment of their appearance they merely indicate the possibility of order in wholeness.

[537] What the alchemist tried to express with his Rebis and his squaring of the circle, and what the modern man also tries to express when he draws patterns of circles and quaternities, is wholeness—a wholeness that resolves all opposition and puts an end to conflict, or at least draws its sting. The symbol of this is a *coincidentia oppositorum* which, as we know, Nicholas of Cusa identified with God. It is far from my intention to cross swords with this great man. My business is merely the natural science of the psyche, and my main concern to establish the facts. How these facts are named and what further interpretation is then placed upon them is of secondary importance. Natural science is not a science of words and ideas, but of facts. I am no terminological rigorist–call the existing symbols “wholeness,” “self,” “consciousness,” “higher ego,” or what you will, it makes little difference. I for my part only try not to give any false or misleading names. All these terms are simply names for the facts that alone carry weight. The names I give do not imply a philosophy, although I cannot prevent people from barking at these terminological phantoms as if they were metaphysical hypostases. The facts are sufficient in themselves, and it is well to know about them. But

their interpretation should be left to the individual’s discretion. “The maximum is that to which nothing is opposed, and in which the minimum is also the maximum,”[27] says Nicholas of Cusa. Yet God is also above the opposites: “Beyond this coincidence of creating and being created art thou God.”[28] Man is an analogy of God: “Man is God, but not in an absolute sense, since he is man. He is therefore God in a human way. Man is also a world, but he is not all things at once in contracted form, since he is man. He is therefore a microcosm.”[29] Hence the *complexio oppositorum* proves to be not only a possibility but an ethical duty: “In these most profound matters every endeavour of our human intelligence should be bent to the achieving of that simplicity where contradictories are reconciled.”[30] The alchemists are as it were the empiricists of the great problem of the union of opposites, whereas Nicholas of Cusa is its philosopher.

EPILOGUE

[538] To give any description of the transference phenomenon is a very difficult and delicate task, and I did not know how to set about it except by drawing upon the symbolism of the alchemical *opus*. The *theoria* of alchemy, as I think I have shown, is for the most part a projection of unconscious contents, of those archetypal forms which are characteristic of all pure fantasy-products, such as are to be met with in myths and fairytales, or in the dreams, visions, and the delusional systems of individual men and women. The important part played in the history of alchemy by the hierosgamos and the mystical marriage, and also by the *coniunctio*, corresponds to the central significance of the transference in psychotherapy on the one hand and in the field of normal human relationships on the other. For this reason, it did not seem to me too rash an undertaking to use an historical document, whose substance derives from centuries of mental effort, as the basis and guiding thread of my argument. The gradual unfolding of the symbolic drama presented me with a welcome opportunity to bring together the countless individual experiences I have had in the course of many years' study of this theme—experiences which, I readily admit, I did not know how to arrange in any other way. This venture, therefore, must be regarded as a mere experiment; I have no desire to attribute any conclusive significance to it. The problems connected with the transference are so complicated and so various that I lack the categories necessary for a systematic account. There is in such cases always an urge to simplify things, but this is dangerous because it so easily violates the facts by seeking to reduce incompatibles to a common denominator. I have resisted this temptation so far as possible and allow myself to hope that the reader will not run away with the idea that the process I have described here is a working model of the average course of events. Experience shows, in fact, that not only were the alchemists exceedingly vague as to the sequence of the various stages, but that in our observation of individual cases there is a bewildering number of variations as well as the greatest arbitrariness in

the sequence of states, despite all agreement in principle as to the basic facts. A logical order, as we understand it, or even the possibility of such an order, seems to lie outside the bounds of our subject at present. We are moving here in a region of individual and unique happenings that have no parallel. A process of this kind can, if our categories are wide enough, be reduced to an order of sorts and described, or at least adumbrated, with the help of analogies; but its inmost essence is the uniqueness of a life individually lived—which nobody can grasp from outside, but which, on the contrary, holds the individual in its grip. The series of pictures that served as our Ariadne thread is one of many,[1] so that we could easily set up several other working models which would display the process of transference each in a different light. But no single model would be capable of fully expressing the endless wealth of individual variations which all have their *raison d'être*. Such being the case, it is clear to me that even this attempt to give a comprehensive account of the phenomenon is a bold undertaking. Yet its practical importance is so great that the attempt surely justifies itself, even if its defects give rise to misunderstandings.

[539] We live today in a time of confusion and disintegration. Everything is in the melting pot. As is usual in such circumstances, unconscious contents thrust forward to the very borders of consciousness for the purpose of compensating the crisis in which it finds itself. It is therefore well worth our while to examine all such borderline phenomena with the greatest care, however obscure they seem, with a view to discovering the seeds of new and potential orders. The transference phenomenon is without doubt one of the most important syndromes in the process of individuation; its wealth of meanings goes far beyond mere personal likes and dislikes. By virtue of its collective contents and symbols it transcends the individual personality and extends into the social sphere, reminding us of those higher human relationships which are so painfully absent in our present social order, or rather disorder. The symbols of the circle and the quaternity, the hallmarks of the individuation process, point back, on the one hand, to the original and primitive order of human society, and forward on the other to an inner order of the psyche. It is as though the psyche were the indispensable instrument in the

reorganization of a civilized community as opposed to the collectivities which are so much in favour today, with their aggregations of half-baked mass-men. This type of organization has a meaning only if the human material it purports to organize is good for something. But the mass-man is good for nothing—he is a mere particle that has forgotten what it is to be human and has lost its soul. What our world lacks is the *psychic connection;* and no clique, no community of interests, no political party, and no State will ever be able to replace this. It is therefore small wonder that it was the doctors and not the sociologists who were the first to feel more clearly than anybody else the true needs of man, for, as psychotherapists, they have the most direct dealings with the sufferings of the soul. If my general conclusions sometimes coincide almost word for word with the thoughts of Pestalozzi, the deeper reason for this does not lie in any special knowledge I might possess of this great educator’s writings, but in the nature of the subject itself, that is, in insight into the reality of man.

APPENDIX

THE REALITIES OF PRACTICAL PSYCHOTHERAPY[1]

[540] Psychogenic disturbances, quite unlike organic diseases, are atypical and individual. With growing experience one even finds oneself at a loss in making a diagnosis. The neuroses, for example, vary so much from individual to individual that it hardly means anything when we diagnose "hysteria." "Hysteria" has a meaning only in so far as it marks a distinction from an organic disease. To the psychotherapist it means infinitely less than typhoid, scarlet fever, or pneumonia do to the practising physician. It belongs to a group that is only vaguely defined both clinically and psychologically, like "obsessional neurosis" or "schizophrenia." Though we cannot do without such a nomenclature, we use it with the feeling that we have not said very much. As a rule, the diagnosis does not greatly matter since the needs and the difficulties of the treatment have to do with quite other factors than the more or less fortuitous diagnosis. And because there are only individual illnesses, they practically never follow a typical course on which a specific diagnosis could be based.

[541] What we have said about diagnosis is also true of therapy in so far as this takes the form of an individual analysis. It is just as impossible to describe a typical course of treatment as it is to make a specific diagnosis. This radical, not to say nihilistic statement naturally does not apply to cases where a *method* is employed as a matter of principle. Here the accent lies on the procedure and not on the recognition of the individual symptoms and their aetiology. One can employ any method at random, so to speak, regardless of the individual factors; one can hypnotize, suggest, train the will, psychoanalyse in such a way that the individual neurosis amounts to little more than a *disturbance of the method employed*. A physician can treat syphilis with a mercury compound, or rheumatic fever with salicylate, without qualms and without under normal circumstances going wide of the mark. But when the psychotherapist treats neuroses according to Freud, Adler, or Jung—that is to say, when he employs their alleged methods as a matter of principle—it may easily happen that the procedure, although

unexceptionable in itself, is so disturbed and thrown off the rails by an atypical neurosis that the entire treatment comes to nothing. The orthodox standpoint then holds that this was the patient's fault, as though he had failed to take advantage of the indubitable blessings of the method, which in itself is always effective.

[542] One can employ methods as a matter of principle so long as the pathological processes are restricted to a field that is markedly collective and not individual, and so long as the premises on which the method is based are in accord with the pathological facts. Not everyone has a power complex, which as a rule is characteristic of the unsuccessful person, nor is everyone involved in an incestuous romance, which happens only to those whose family have soured them against the pleasure principle. But when the premises of the method coincide with the problematical situation of the patient, the method will be successful up to the moment when its collective viewpoint can no longer grasp the individual factors that begin to appear. It is then no longer a question of fictions and inferiority feelings that can be reduced to power complexes, or of resistances and repressions that can be reduced to infantile sexuality, but of individual, unique factors of vital importance. When this point is reached, it is the method and the analyst that fail, not the patient. Yet I have had many patients who have dolefully confessed that they could not be treated because they always "failed" with the transference, in other words, could not produce one, when according to the method a transference was a therapeutic necessity. Any analyst who inculcates such things into his patients is entirely forgetting that "transference" is only another word for "projection." No one can voluntarily *make* projections, they just *happen*. Besides that, they are illusions which merely make the treatment more difficult. What seems to be so easily won by the transference always turns out in the end to be a loss; for a patient who gets rid of a symptom by transferring it to the analyst always makes the analyst the guarantor of this miracle and so binds himself to him more closely than ever.

[543] When one employs a method on principle, it is perfectly possible, within those limits, to describe a more or less typical course of treatment. Speaking for myself, I must confess that experience has taught me to

keep away from therapeutic “methods” as much as from diagnoses. The enormous variation among individuals and their neuroses has set before me the ideal of approaching each case with a minimum of prior assumptions. The ideal would naturally be to have no assumptions at all. But this is impossible even if one exercises the most rigorous self-criticism, for one is *oneself* the biggest of all one’s assumptions, and the one with the gravest consequences. Try as we may to have no assumptions and to use no ready-made methods, the assumption that I myself am will determine my method: as I am, so will I proceed.

[544] In spite of the differences between people, we must recognize that there are a great many similarities. As long as the analyst moves within a psychological sphere that is similar in kind to the patient’s, nothing of fundamental therapeutic importance has happened. He has at most laid the foundations of a mutual understanding, and this can be appealed to when he comes up against those essential differences in the patient to which the pathological process is always ready to return. These qualitative differences cannot be dealt with by any method that is based on premises held to be generally valid. If one wants to give a name to the process of coming to terms with them, one could call it a dialectical procedure—which means no more than an encounter between my premises and the patient’s. This encounter is complicated by the fact that the patient’s premises are to some extent pathological, whereas a so-called “normal” attitude is presupposed of the analyst.

[545] “Normal” is a somewhat vague concept which simply means that the analyst at least has no neurosis and is more or less in full possession of his mental faculties. If, on the contrary, he is neurotic, a fateful, unconscious identity with the patient will inevitably supervene—a “counter-transference” of a positive or negative character. Even if the analyst has no neurosis, but only a rather more extensive area of unconsciousness than usual, this is sufficient to produce a sphere of mutual unconsciousness, i.e., a counter-transference. This phenomenon is one of the chief occupational hazards of psychotherapy. It causes psychic infections in both analyst and patient and brings the therapeutic process to a standstill. This state of unconscious identity is also the reason why an analyst can help his patient just so far as he himself has gone and not a

step further. In my practice I have had from the beginning to deal with patients who got “stuck” with their previous analysts, and this always happened at the point where the analyst could make no further progress with himself. As soon as an unconscious identity appears, one notices a peculiar staleness and triteness in the analytical relationship, the dreams become incomprehensible or cease altogether, personal misunderstandings arise, with outbursts of affect, or else there is a resigned indifference which leads sooner or later to a discontinuation of the treatment.

[546] The reason for this may not always lie in the analyst’s evasion of his personal difficulties, but in a *lack of knowledge, which has exactly the same effect as unconsciousness*. I remember a case that caused me no end of trouble.[2] It concerned a 25-year-old woman patient, who suffered from a high degree of emotivity, exaggerated sensitiveness, and hysterical fever. She was very musical; whenever she played the piano she got so emotional that her temperature rose and after ten minutes registered 100° F. or more. She also suffered from a compulsive argumentativeness and a fondness for philosophical hair-splitting that was quite intolerable despite her high intelligence. She was unmarried, but was having a love-affair which, except for her hypersensitivity, was perfectly normal. Before she came to me, she had been treated by an analyst for two months with no success. Then she went to a woman analyst, who broke off the treatment at the end of a week. I was the third. She felt she was one of those who were doomed to fail in analysis, and she came to me with pronounced feelings of inferiority. She didn’t know why it hadn’t worked with the other analysts. I got her to tell me her somewhat lengthy anamnesis, which took several consulting hours. I then asked her: “Did you notice that when you were treated by Dr. X [the first], you had at the very beginning a dream which struck you, and which you did not understand at the time?” She remembered at once that during the second week of the treatment she had an impressive dream which she had not understood then, but which seemed clear enough to her in the light of later events. *She had dreamt that she had to cross a frontier. She had arrived at a frontier station; it was night, and she had to find where the frontier could be crossed, but she could not find the way and got lost in the darkness.*

This darkness represented her unconsciousness, that is, her unconscious identity with the analyst, who was also in the dark about finding a way out of this unconscious state—which is what crossing the frontier meant. As a matter of fact, a few years later this analyst gave up psychotherapy altogether because of too many failures and personal involvements.

[547] Early in the second treatment, the dream of the frontier was repeated in the following form: *She had arrived at the same frontier station. She had to find the crossing, and she saw, despite the darkness, a little light in the distance showing where the place was. In order to get there, she had to go through a wooded valley in pitch-blackness. She plucked up her courage and went ahead. But hardly had she entered the wood than she felt somebody clinging to her, and she knew it was her analyst*. She awoke in terror. This analyst, too, later gave up her profession for very much the same reasons.

[548] I now asked the patient: "Have you had a dream like that since you have been with me?" She gave an embarrassed smile and told the following dream: *I was at the frontier station. A customs official was examining the passengers one by one. I had nothing but my handbag, and when it came to my turn I answered with a good conscience that I had nothing to declare. But he said, pointing to my handbag: "What have you got in there?" And to my boundless astonishment he pulled a large mattress, and then a second one, out of my bag."* She was so frightened that she woke up.[3]

[549] I then remarked: "So you wanted to hide your obviously bourgeois wish to get married, and felt you had been unpleasantly caught out." Though the patient could not deny the logical rightness of the interpretation, she produced the most violent resistances against any such possibility. Behind these resistances, it then turned out, there was hidden a most singular fantasy of a quite unimaginable erotic adventure that surpassed anything I had ever come across in my experience. I felt my head reeling, I thought of nymphomaniac possession, of weird perversions, of completely depraved erotic fantasies that rambled meaninglessly on and on, of latent schizophrenia, where at least the nearest comparative material could be found. I began to look askance at

the patient and to find her unsympathetic, but was annoyed with myself for this, because I knew that no good results could be hoped for while we remained on such a footing. After about four weeks the undeniable symptoms of a standstill did in fact appear. Her dreams became sketchy, dull, dispiriting, and incomprehensible. I had no more ideas and neither had the patient. The work became tedious, exhausting, and barren. I felt that we were gradually getting stuck in a kind of soggy dough. The case began to weigh upon me even in my leisure hours; it seemed to me uninteresting, hardly worth the bother. Once I lost patience with her because I felt she wasn't making any effort. "So here are the personal reactions coming out," I thought. The following night *I dreamt that I was walking along a country road at the foot of a steep hill. On the hill was a castle with a high tower. Sitting on the parapet of the topmost pinnacle was a woman, golden in the light of the evening sun. In order to see her properly, I had to bend my head so far back that I woke up with a crick in the neck*. I realized to my amazement that the woman was my patient.[4]

[550] The dream was distinctly disturbing, for the first thing that came into my head while dozing was the verse from Schenkenbach's "Reiterlied":

> She sits so high above us,
> No prayer will she refuse.

This is an invocation to the Virgin Mary. The dream had put my patient on the highest peak, making her a goddess, while I, to say the least, had been looking down on her.

[551] The next day I said to her: "Haven't you noticed that our work is stuck in the doldrums?" She burst into tears and said: "Of course I've noticed it. I know I always fail and never do anything right. You were my last hope and now this isn't going to work either." I interrupted her: "This time it is different. I've had a dream about you." And I told her the dream, with the result that the superficial symptomatology, her argumentativeness, her insistence on always being right, and her touchiness vanished. But now her real neurosis began, and it left me completely flabbergasted. It started with a series of highly impressive dreams, which I could not understand at all, and then she developed symptoms whose cause, structure, and significance were absolutely

incomprehensible to me. They first took the form of an indefinable excitation in the perineal region, and she dreamt that a white elephant was coming out of her genitals. She was so impressed by this that she tried to carve the elephant out of ivory. I had no idea what it meant, and only had the uncomfortable feeling that something inexplicable was going on with a logic of its own, though I couldn't see at all where it would lead.

[552] Soon afterwards symptoms of uterine ulcers appeared, and I had to send the patient to a gynaecologist. There was an inflamed swelling of the mucous membrane of the uterus, about the size of a pea, which refused to heal after months of treatment and merely shifted from place to place.

[553] Suddenly this symptom disappeared, and she developed an extreme hyperaesthesia of the bladder. She had to leave the room two or three times during the consulting hour. No local infection could be found. Psychologically, the symptom meant that something had to be "expressed." So I gave her the task of expressing by drawings whatever her hand suggested to her. She had never drawn before, and set about it with much doubt and hesitation. But now symmetrical flowers took shape under her hand, vividly coloured and arranged in symbolic patterns.[5] She made these pictures with great care and with a concentration I can only call devout.

[554] Meanwhile the hyperaesthesia of the bladder had ceased, but intestinal spasms developed higher up, causing gurgling noises and sounds of splashing that could be heard even outside the room. She also suffered from explosive evacuations of the bowels. At first the colon was affected, then the ileum, and finally the upper sections of the small intestine. These symptoms gradually abated after several weeks. Their place was then taken by a strange paraesthesia of the head. The patient had the feeling that the top of her skull was growing soft, that the fontanelle was opening up, and that a bird with a long sharp beak was coming down to pierce through the fontanelle as far as the diaphragm.

[555] The whole case worried me so much that I told the patient there was no sense in her coming to me for treatment, I didn't understand two-

thirds of her dreams, to say nothing of her symptoms, and besides this I had no notion how I could help her. She looked at me in astonishment and said: “But it’s going splendidly! It doesn’t matter that you don’t understand my dreams. I always have the craziest symptoms, but something is happening all the time.”

[556] I could only conclude from this peculiar remark that for her the neurosis was a positive experience; indeed, “positive” is a mild expression for the way she felt about it. As I could not understand her neurosis, I was quite unable to explain how it was that all these extremely unpleasant symptoms and incomprehensible dreams could give her such a positive feeling. One can, with an effort, imagine that *something* is better than nothing, even though this something took the form of disagreeable physical symptoms. But so far as the dreams were concerned, I can only say that I have seldom come across a series of dreams that seemed to be so full of meaning. Only, their meaning escaped me.

[557] In order to elucidate this extraordinary case, I must return to a point in the anamnesis which has not been mentioned so far. The patient was a full-blooded European, but had been born in Java. As a child she spoke Malay and had an *ayah,* a native nurse. When she was of school age, she went to Europe and never returned to the Indies. Her childhood world was irretrievably sunk in oblivion, so that she could not remember a single word of Malay. In her dreams there were frequent allusions to Indonesian motifs, but though I could sometimes understand them I was unable to weave them into a meaningful whole.

[558] About the time when the fantasy of the fontanelle appeared, I came upon an English book which was the first to give a thorough and authentic account of the symbolism of Tantric Yoga. The book was *The Serpent Power,* by Sir John Woodroffe, who wrote under the pseudonym of Arthur Avalon. It was published about the time when the patient was being treated by me. To my astonishment I found in this book an explanation of all those things I had not understood in the patient’s dreams and symptoms.

[559] It is, as you see, quite impossible that the patient knew the book beforehand. But could she have picked up a thing or two from the *ayah*? I regard this as unlikely because Tantrism, and in particular Kundalini Yoga, is a cult restricted to southern India and has relatively few adherents. It is, moreover, an exceedingly complicated symbolical system which no one can understand unless he has been initiated into it or has at least made special studies in this field. Tantrism corresponds to our Western scholasticism, and if anyone supposes that a Javanese *ayah* could teach a five-year-old child about the *chakra* system, this would amount to saying that a French nanny could induct her charge into the *Summa* of St. Thomas or the conceptualism of Abelard. However the child may have picked up the rudiments of the *chakra* system, the fact remains that its symbolism does much to explain the patient's symptoms.

[560] According to this system, there are seven centres, called *chakras* or *padmas* (lotuses), which have fairly definite localizations in the body. They are, as it were, psychic localizations, and the higher ones correspond to the historical localizations of consciousness. The nethermost *chakra*, called *mulādhāra*, is the perineal lotus and corresponds to the cloacal zone in Freud's sexual theory. This centre, like all the others, is represented in the shape of a flower, with a circle in the middle, and has attributes that express in symbols the psychic qualities of that particular localization. Thus, the perineal *chakra* contains as its main symbol the sacred *white elephant*. The next *chakra*, called *svadhisthāna*, is localized near the bladder and represents the sexual centre. Its main symbol is water or sea, and subsidiary symbols are the sickle moon as the feminine principle, and a devouring water-monster called *makara*, which corresponds to the biblical and cabalistic Leviathan. The mythological whaledragon is, as you know, a symbol for the devouring and birth-giving womb, which in its turn symbolizes certain reciprocal actions between consciousness and the unconscious. The patient's bladder symptoms can be referred to the *svadhisthāna* symbolism, and so can the inflamed spots in the uterus. Soon afterwards she began her drawings of flowers, whose symbolic content relates them quite clearly to the *chakras*. The third centre, called *manipura*, corresponds to the solar plexus. As we have seen, the noises in the abdomen gradually moved up

to the small intestine. This third *chakra* is the emotional centre, and is the earliest known localization of consciousness. There are primitives in existence who still think with their bellies. Everyday speech still shows traces of this: something lies heavy on the stomach, the bowels turn to water, etc. The fourth *chakra*, called *anāhata*, is situated in the region of the heart and the diaphragm. In Homer the diaphragm (*phren, phrenes*) was the seat of feeling and thinking.[6] The fifth and sixth, called *vishuddha* and *ajña*, are situated respectively in the throat and between the eyebrows. The seventh, *sahasrāra*, is at the top of the skull.

[561] The fundamental idea of Tantrism is that a feminine creative force in the shape of a serpent, named *kundalinī*, rises up from the perineal centre, where she had been sleeping, and ascends through the *chakras*, thereby activating them and constellating their symbols. This “Serpent Power” is personified as the *mahādevishakti*, the goddess who brings everything into existence by means of *māyā*, the building material of reality.

[562] When the *kundalinī* serpent had reached the *manipura* centre in my patient, it was met by the bird of thought descending from above, which with its sharp beak pierced through the fontanelle (*sahasrāra chakra*) to the diaphragm (*anāhata*). Thereupon a wild storm of affect broke out, because the bird had implanted in her a thought which she would not and could not accept. She gave up the treatment and I saw her only occasionally, but noticed she was hiding something. A year later came the confession: she was beset by the thought that she wanted a child. This very ordinary thought did not fit in at all well with the nature of her psychic experience and it had a devastating effect, as I could see for myself. For as soon as the *kundalinī* serpent reached *manipura*, the most primitive centre of consciousness, the patient’s brain told her what kind of thought the *shakti* was insinuating into her: that she wanted a real child and not just a psychic experience. This seemed a great let-down to the patient. But that is the disconcerting thing about the *shakti:* her building material is *māyā*, “real illusion.” In other words, she spins fantasies with real things.

[563] This little bit of Tantric philosophy helped the patient to make an ordinary human life for herself, as a wife and mother, out of the local

demonology she had sucked in with her *ayah's* milk, and to do so without losing touch with the inner, psychic figures which had been called awake by the long-forgotten influences of her childhood. What she experienced as a child, and what later estranged her from the European consciousness and entangled her in a neurosis, was, with the help of analysis, transformed not into nebulous fantasies but into a lasting spiritual possession in no way incompatible with an ordinary human existence, a husband, children, and housewifely duties.

[564] Although this case is an unusual one, it is not an exception. It has served its purpose if it has enabled me to give you some idea of my psychotherapeutic procedure. The case is not in the least a story of triumph; it is more like a saga of blunders, hesitations, doubts, gropings in the dark, and false clues which in the end took a favourable turn. But all this comes very much nearer the truth and reality of my procedure than a case that brilliantly confirms the preconceived opinions and intentions of the therapist. I am painfully aware, as you too must be, of the gaps and shortcomings of my exposition, and I must rely on your imagination to supply a large part of what has been left unsaid. If you now recall that mutual ignorance means mutual unconsciousness and hence unconscious identity, you will not be wrong in concluding that in this case the analyst's lack of knowledge of Oriental psychology drew him further and further into the analytical process and forced him to participate as actively as possible. Far from being a technical blunder, this is a fate-sent necessity in such a situation. Only your own experience can tell you what this means in practice. No psychotherapist should lack that natural reserve which prevents people from riding roughshod over mysteries they do not understand and trampling them flat. This reserve will enable him to pull back in good time when he encounters the mystery of the patient's difference from himself, and to avoid the danger—unfortunately only too real—of committing psychic murder in the name of therapy. For the ultimate cause of a neurosis is something *positive* which needs to be safeguarded for the patient; otherwise he suffers a psychic loss, and the result of the treatment is at best a defective cure. The fact that our patient was born in the East and spent the most imporant years of her childhood under Oriental influences is something

that cannot be eliminated from her life. The childhood experience of a neurotic is not, in itself, negative; far from it. It becomes negative only when it finds no suitable place in the life and outlook of the adult. The real task of analysis, it seems to me, is to bring about a synthesis between the two.

BIBLIOGRAPHY

BIBLIOGRAPHY

The items of the bibliography are arranged alphabetically under two headings: *A.* Ancient volumes containing collections of alchemical tracts by various authors; *B.* General bibliography, including cross-references to the material in section *A.* Short titles of the ancient volumes are printed in capital letters.

A. ANCIENT VOLUMES CONTAINING COLLECTIONS OF ALCHEMICAL TRACTS BY VARIOUS AUTHORS

ARS CHEMICA, quod sit licita recte exercentibus, probationes doctissimorum iurisconsultorum…. Strasbourg, 1566.

Contents quoted in this volume:

i Septem tractatus seu capitula Hermetis Trismegisti aurei [pp. 7–31; usually referred to as “Tractatus aureus”]

ii Studium Consilii coniugii de massa solis et lunae [pp. 48–263; usually referred to as “Consilium coniugii”]

ARTIS AURIFERAE quam chemiam vocant…. Basel, [1593]. 2 vols.

Contents quoted in this volume:

VOLUME I

i Aenigmata ex visione Arislei philosophi et allegoriis sapientum [pp. 146–54; usually referred to as “Visio Arislei”]

ii In Turbam philosophorum exercitationes [pp. 154–82]

iii Aurora consurgens, quae dicitur Aurea hora [Part II only] [pp. 185–246]

iv Rosinus ad Euthiciam [pp. 246–77]

v Rosinus ad Sarratantam episcopum [pp. 277–319]

vi Maria Prophetissa: Practica… in artem alchemicam [pp. 319–24]

vii Kalid: Liber secretorum alchemiae [pp. 325–51]

viii Kalid: Liber trium verborum [pp. 352–61]
ix Tractatulus Aristotelis de practica lapidis philosophici [pp. 361–73]
x Merlinus: Allegoria de arcano lapidis [pp. 392–96]
xi Tractatulus Avicennae [pp. 405–36]
xii Liber de arte chimica [pp. 575–631]

VOLUME II

xiii Morienus Romanus: Sermo de transmutatione metallica [pp. 7–54]
xiv Rosarium philosophorum [pp. 204–384]

MANGET (US), JOANNES JACOBUS (ed.). *BIBLIOTHECA CHEMICA CURIOSA, seu Rerum ad alchemiam pertinentium thesaurus instructissimus*.… Geneva, 1702. 2 vols.

Contents quoted in this volume:

i Hermes Trismegistus: Tractatus aureus de lapidis physici secreto [pp. 400–445]
ii Lully: Testamentum novissimum, regi Carolo dicatum [pp. 790–806]
iii [Altus:] Mutus Liber, in quo tamen tota Philosophia hermetica figuris hieroglyphicis depingitur [pp. 938–53]

MUSAEUM HERMETICUM rejormatum et amplificatum… continens tractatus chimicos XXI praestantissimos… Frankfurt a. M., 1678. For translation, see (*B*) WAITE.

Contents quoted in this volume:

i [Hermes Trismegistus:] Tractatus aureus de philosophorum lapide [pp. 1–52]
ii [Barcius (F. von Sternberg):] Gloria mundi, alias Paradisi tabula [pp. 203–304]
iii Lambspringk: De lapide philosophico figurae et emblemata [pp. 337–72]
iv Philalethes: Introitus apertus ad occlusum regis palatium [pp. 647–700]
v Philalethes: Fons chemica veritatis [pp. 799–814]

THEATRUM CHEMICUM, praecipuos selectorum auctorum tractatus… continens. Vols. I-III, Ursel, 1602; Vols. IV-VI, Strasbourg, 1613, 1622, 1661.

Contents quoted in this volume:

VOLUME I

i Hoghelande: Liber de alchemiae difficultatibus [pp. 121–215]

ii Dorn: Speculativae philosophiae, gradus septem vel decern continens [pp. 255–310]

iii Dorn: Physica Trismegisti [pp. 405–37]

iv Dorn: Duellum animi cum corpore [pp. 535–50]

v Dorn: Congeries Paracelsicae chemicae de transmutationibus metallorum [pp. 557–646]

vi Zacharius, Dionysius: Opusculum philosophiae naturalis metallorum, cum annotationibus Nicolai Flamelli [pp. 804–901]

VOLUME II

vii Aegidius de Vadis: Dialogus inter naturam et filium philosophiae [pp. 95–123]

viii Penotus: Quinquaginta septem canones de opere physico [pp. 150–54]

ix Dee: Monas hieroglyphica [pp. 203–43]

x Ventura: De ratione conficiendi lapidis [pp. 244–356]

VOLUME III

xi [Melchior:] Addam et processum sub forma missae, a Nicolao [Melchiori] Cibinensi, ad Ladislaum Ungariae et Bohemiae regem olim missum [pp. 853–60]

VOLUME IV

xii Artefius: Clavis maioris sapientiae [pp. 221–40]

xiii Avicenna: Declaratio lapidis physici filio suo Aboali [pp. 986–94]

VOLUME V

xiv Liber Platonis quartorum… [pp. 114–208] xv Mennens: Aureum vellus [pp. 267–470]

xvi Bonus: Pretiosa margarita novella [pp. 589–794]

xvii Tractatus Aristotelis alchymistae ad Alexandrum Magnum, de lapide philosophico [pp. 880–92]

THEATRUM CHEMICUM BRITANNICUM.… Collected with annotations by Elias Ashmole. London, 1652.

INDEX

THE COLLECTED WORKS OF

C. G. JUNG

THE PUBLICATION of the first complete edition, in English, of the works of C. G. Jung was undertaken by Routledge and Kegan Paul, Ltd., in England and by Bollingen Foundation in the United States. The American edition is number XX in Bollingen Series, which since 1967 has been published by Princeton University Press. The edition contains revised versions of works previously published, such as *Psychology of the Unconscious*, which is now entitled *Symbols of Transformation*; works originally written in English, such as *Psychology and Religion*; works not previously translated, such as *Aion*; and, in general, new translations of virtually all of Professor Jung's writings. Prior to his death, in 1961, the author supervised the textual revision, which in some cases is extensive. Sir Herbert Read (d. 1968), Dr. Michael Fordham, and Dr. Gerhard Adler compose the Editorial Committee; the translator is R. F. C. Hull (except for Volume 2) and William McGuire is executive editor.

The price of the volumes varies according to size; they are sold separately, and may also be obtained on standing order. Several of the volumes are extensively illustrated. Each volume contains an index and in most a bibliography; the final volumes will contain a complete bibliography of Professor Jung's writings and a general index to the entire edition.

In the following list, dates of original publication are given in parentheses (of original composition, in brackets). Multiple dates indicate revisions.

*1. PSYCHIATRIC STUDIES

On the Psychology and Pathology of So-Called Occult Phenomena (1902)

On Hysterical Misreading (1904)

Cryptomnesia (1905)

On Manic Mood Disorder (1903)

A Case of Hysterical Stupor in a Prisoner in Detention (1902)

On Simulated Insanity (1903)

A Medical Opinion on a Case of Simulated Insanity (1904)

A Third and Final Opinion on Two Contradictory Psychiatric Diagnoses (1906)

On the Psychological Diagnosis of Facts (1905)

†2. EXPERIMENTAL RESEARCHES

Translated by Leopold Stein in collaboration with Diana Riviere

STUDIES IN WORD ASSOCIATION (1904–7, 1910)

The Associations of Normal Subjects (by Jung and F. Riklin)

An Analysis of the Associations of an Epileptic

The Reaction-Time Ratio in the Association Experiment

Experimental Observations on the Faculty of Memory

Psychoanalysis and Association Experiments

The Psychological Diagnosis of Evidence

Association, Dream, and Hysterical Symptom

The Psychopathological Significance of the Association Experiment

Disturbances in Reproduction in the Association Experiment

The Association Method

The Family Constellation

PSYCHOPHYSICAL RESEARCHES (1907–8)

On the Psychophysical Relations of the Association Experiment

Psychophysical Investigations with the Galvanometer and Pneumograph in Normal and Insane Individuals (by F. Peterson and Jung)

Further Investigations on the Galvanic Phenomenon and Respiration in Normal and Insane Individuals (by C. Ricksher and Jung)

Appendix: Statistical Details of Enlistment (1906); New Aspects of Criminal Psychology (1908); The Psychological Methods of

Investigation Used in the Psychiatric Clinic of the University of Zurich (1910); On the Doctrine of Complexes ([1911] 1913); On the Psychological Diagnosis of Evidence (1937)

*3. THE PSYCHOGENESIS OF MENTAL DISEASE

The Psychology of Dementia Praecox (1907)
The Content of the Psychoses (1908/1914)
On Psychological Understanding (1914)
A Criticism of Bleuler's Theory of Schizophrenic Negativism (1911)
On the Importance of the Unconscious in Psychopathology (1914)
On the Problem of Psychogenesis in Mental Disease (1919)
Mental Disease and the Psyche (1928)
On the Psychogenesis of Schizophrenia (1939)
Recent Thoughts on Schizophrenia (1957)
Schizophrenia (1958)

†4. FREUD AND PSYCHOANALYSIS

Freud's Theory of Hysteria: A Reply to Aschaffenburg (1906)
The Freudian Theory of Hysteria (1908)
The Analysis of Dreams (1909)
A Contribution to the Psychology of Rumour (1910–11)
On the Significance of Number Dreams (1910–11)
Morton Prince, "The Mechanism and Interpretation of Dreams": A Critical Review (1911)
On the Criticism of Psychoanalysis (1910)
Concerning Psychoanalysis (1912)
The Theory of Psychoanalysis (1913)
General Aspects of Psychoanalysis (1913)
Psychoanalysis and Neurosis (1916)
Some Crucial Points in Psychoanalysis: A Correspondence between Dr. Jung and Dr. Loÿ (1914)
Prefaces to "Collected Papers on Analytical Psychology" (1916, 1917)

The Significance of the Father in the Destiny of the Individual (1909/1949)
Introduction to Kranefeldt's "Secret Ways of the Mind" (1930)
Freud and Jung: Contrasts (1929)

‡5. SYMBOLS OF TRANSFORMATION (1911–12/1952)

PART I

Introduction
Two Kinds of Thinking
The Miller Fantasies: Anamnesis
The Hymn of Creation
The Song of the Moth

PART II

Introduction
The Concept of Libido
The Transformation of Libido
The Origin of the Hero
Symbols of the Mother and of Rebirth
The Battle for Deliverance from the Mother
The Dual Mother
The Sacrifice
Epilogue
Appendix: The Miller Fantasies

*6. PSYCHOLOGICAL TYPES (1921)

Introduction
The Problem of Types in the History of Classical and Medieval Thought
Schiller's Ideas on the Type Problem
The Apollinian and the Dionysian
The Type Problem in Human Character
The Type Problem in Poetry
The Type Problem in Psychopathology

The Type Problem in Aesthetics
The Type Problem in Modern Philosophy
The Type Problem in Biography
General Description of the Types
Definitions
Epilogue
Four Papers on Psychological Typology (1913, 1925, 1931, 1936)

†7. TWO ESSAYS ON ANALYTICAL PSYCHOLOGY
On the Psychology of the Unconscious (1917/1926/1943)
The Relations between the Ego and the Unconscious (1928)
Appendix: New Paths in Psychology (1912); The Structure of the Unconscious (1916) (new versions, with variants, 1966)

‡8. THE STRUCTURE AND DYNAMICS OF THE PSYCHE
On Psychic Energy (1928)
The Transcendent Function ([1916]/1957)
A Review of the Complex Theory (1934)
The Significance of Constitution and Heredity in Psychology (1929)
Psychological Factors Determining Human Behavior (1937)
Instinct and the Unconscious (1919)
The Structure of the Psyche (1927/1931)
On the Nature of the Psyche (1947/1954)
General Aspects of Dream Psychology (1916/1948)
On the Nature of Dreams (1945/1948)
The Psychological Foundations of Belief in Spirits (1920/1948)
Spirit and Life (1926)
Basic Postulates of Analytical Psychology (1931)
Analytical Psychology and *Weltanschauung* (1928/1931)
The Real and the Surreal (1933)
The Stages of Life (1930–1931)
The Soul and Death (1934)
Synchronicity: An Acausal Connecting Principle (1952)

Appendix: On Synchronicity (1951)

*9. PART I. THE ARCHETYPES AND THE COLLECTIVE UNCONSCIOUS

Archetypes of the Collective Unconscious (1934/1954)
The Concept of the Collective Unconscious (1936)
Concerning the Archetypes, with Special Reference to the Anima Concept (1936/1954)
Psychological Aspects of the Mother Archetype (1938/1954)
Concerning Rebirth (1940/1950)
The Psychology of the Child Archetype (1940)
The Psychological Aspects of the Kore (1941)
The Phenomenology of the Spirit in Fairytales (1945/1948)
On the Psychology of the Trickster-Figure (1954)
Conscious, Unconscious, and Individuation (1939)
A Study in the Process of Individuation (1934/1950)
Concerning Mandala Symbolism (1950)
Appendix: Mandalas (1955)

*9. PART II. AION (1951)

RESEARCHES INTO THE PHENOMENOLOGY OF THE SELF

The Ego
The Shadow
The Syzygy: Anima and Animus
The Self
Christ, a Symbol of the Self
The Sign of the Fishes
The Prophecies of Nostradamus
The Historical Significance of the Fish
The Ambivalence of the Fish Symbol
The Fish in Alchemy
The Alchemical Interpretation of the Fish
Background to the Psychology of Christian Alchemical Symbolism

Gnostic Symbols of the Self
The Structure and Dynamics of the Self
Conclusion

*10. CIVILIZATION IN TRANSITION
The Role of the Unconscious (1918)
Mind and Earth (1927/1931)
Archaic Man (1931)
The Spiritual Problem of Modern Man (1928/1931)
The Love Problem of a Student (1928)
Woman in Europe (1927)
The Meaning of Psychology for Modern Man (1933/1934)
The State of Psychotherapy Today (1934)
Preface and Epilogue to “Essays on Contemporary Events” (1946)
Wotan (1936)
After the Catastrophe (1945)
The Fight with the Shadow (1946)
The Undiscovered Self (Present and Future) (1957)
Flying Saucers: A Modern Myth (1958)
A Psychological View of Conscience (1958)
Good and Evil in Analytical Psychology (1959)
Introduction to Wolff’s “Studies in Jungian Psychology” (1959)
The Swiss Line in the European Spectrum (1928)
Reviews of Keyserling’s “America Set Free” (1930) and “La Révolution Mondiale” (1934)
The Complications of American Psychology (1930)
The Dreamlike World of India (1939)
What India Can Teach Us (1939)
Appendix: Documents (1933–1938)

†11 PSYCHOLOGY AND RELIGION: WEST AND EAST

WESTERN RELIGION

Psychology and Religion (The Terry Lectures) (1938/1940)

A Psychological Approach to the Dogma of the Trinity (1942/1948)
Transformation Symbolism in the Mass (1942/1954)
Forewords to White's "God and the Unconscious" and Werblowsky's "Lucifer and Prometheus" (1952)
Brother Klaus (1933)
Psychotherapists or the Clergy (1932)
Psychoanalysis and the Cure of Souls (1928)
Answer to Job (1952)

EASTERN RELIGION

Psychological Commentaries on "The Tibetan Book of the Great Liberation" (1939/1954) and "The Tibetan Book of the Dead" (1935/1953)
Yoga and the West (1936)
Foreword to Suzuki's "Introduction to Zen Buddhism" (1939)
The Psychology of Eastern Meditation (1943)
The Holy Men of India: Introduction to Zimmer's "Der Weg zum Selbst" (1944)
Foreword to the "I Ching" (1950)

*12. PSYCHOLOGY AND ALCHEMY (1944)

Prefatory note to the English Edition ([1951?] added 1967)
Introduction to the Religious and Psychological Problems of Alchemy
Individual Dream Symbolism in Relation to Alchemy (1936)
Religious Ideas in Alchemy (1937)
Epilogue

†13. ALCHEMICAL STUDIES

Commentary on "The Secret of the Golden Flower" (1929)
The Visions of Zosimos (1938/1954)
Paracelsus as a Spiritual Phenomenon (1942)
The Spirit Mercurius (1943/1948)
The Philosophical Tree (1945/1954)

‡14. MYSTERIUM CONIUNCTIONIS (1955–56)

AN INQUIRY INTO THE SEPARATION AND
SYNTHESIS OF PSYCHIC OPPOSITES IN ALCHEMY

The Components of the Coniunctio
The Paradoxa
The Personification of the Opposites
Rex and Regina
Adam and Eve
The Conjunction

*15. THE SPIRIT IN MAN, ART, AND LITERATURE

Paracelsus (1929)
Paracelsus the Physician (1941)
Sigmund Freud in His Historical Setting (1932)
In Memory of Sigmund Freud (1939)
Richard Wilhelm: In Memoriam (1930)
On the Relation of Analytical Psychology to Poetry (1922)
Psychology and Literature (1930/1950)
“Ulysses”: A Monologue (1932)
Picasso (1932)

†16. THE PRACTICE OF PSYCHOTHERAPY

GENERAL PROBLEMS OF PSYCHOTHERAPY

Principles of Practical Psychotherapy (1935)
What Is Psychotherapy? (1935)
Some Aspects of Modern Psychotherapy (1930)
The Aims of Psychotherapy (1931)
Problems of Modern Psychotherapy (1929)
Psychotherapy and a Philosophy of Life (1943)
Medicine and Psychotherapy (1945)
Psychotherapy Today (1945)
Fundamental Questions of Psychotherapy (1951)

SPECIFIC PROBLEMS OF PSYCHOTHERAPY

The Therapeutic Value of Abreaction (1921/1928)
The Practical Use of Dream-Analysis (1934)
The Psychology of the Transference (1946)
Appendix: The Realities of Practical Psychotherapy ([1937] added, 1966)

‡17. THE DEVELOPMENT OF PERSONALITY
Psychic Conflicts in a Child (1910/1946)
Introduction to Wickes's "Analyses der Kinderseele" (1927/1931)
Child Development and Education (1928)
Analytical Psychology and Education: Three Lectures (1926/1946)
The Gifted Child (1943)
The Significance of the Unconscious in Individual Education (1928)
The Development of Personality (1934)
Marriage as a Psychological Relationship (1925)

18. THE SYMBOLIC LIFE
Miscellaneous Writings

19. GENERAL BIBLIOGRAPHY OF C. G.JUNG'S WRITINGS

20. GENERAL INDEX TO THE COLLECTED WORKS

[1] [Delivered as a lecture to the Zurich Medical Society in 1935. Published as “Grundsätzliches zur praktischen Psychotherapie,” *Zentralblatt für Psychotherapie*, VIII (1935): 2, 66–82.—EDITORS.]

[1] [Delivered as a lecture, “Was ist Psychotherapie?,” in May 1935. at a symposium on “Psychotherapy in Switzerland.” Subsequently published in *Schweizerische Aerztezeitung fur Standesfragen*, XVI: 26 (June, 1935), 335–39.—EDITORS.]

[1] [Written in English. Read at the Congress of the Society of Public Health, Zurich, in 1929. First published in *Journal of State Medicine* (London), XXXVIII: 6 (June, 1930), 348–54.—EDITORS.]

[1] [*Delivered as a lecture, “Ziele der Psychotherapie,” on April 12, 1929, at the 4th General Medical Congress for Psychotherapy, Bad Nauheim, and published in the *Bericht* of the Congress, 1929; republished in *Seelenprobleme der Gegenwart* (Zurich, 1931). pp. 87–114. Previously trans. by C. F. Baynes and W. S. Dell in *Modern Man in Search of a Soul* (London and New York, 1933).—EDITORS.]

[2] [Published at Leipzig, 1904–13.—EDITORS.]

[3] [•The attribution to Coleridge is incorrect, according to Coleridgean scholars who were consulted.—EDITORS.]

[4] [Viz., thinking, feeling, sensation, and intuition.—EDITORS.]

[5] [•The term “nothing but” (*nichts als*) denotes the common habit of explaining something unknown by reducing it to something apparently known and thereby devaluing it. For instance, when a certain illness is said to be “nothing but psychic,” it is explained as imaginary and is thus devalued. The expression is borrowed from James, *The Varieties of Religious Experience*, p. 12.—EDITORS.]

[6] •This has since been remedied. Cf. “A Study in the Process of Individuation.” [Also cf. *Psychology and Alchemy*, Part II.—EDITORS.]

[1] [Published as “Die Probleme der modernen Psychotherapie” in *Schweizerisches Medizinisches Jahrbuch*, 1929, and in *Seelenprobleme der Gegenwart* (Zurich, 1931), pp. 1–39. Previously trans. by C. F. Baynes and W. S. Dell in *Modern Man in Search of a Soul* (London and New York, 1933).—EDITORS.]

[1] [•The introductory address to a discussion at the Conference for Psychology, Zurich, September 26, 1942. Published as “Psychotherapie und Weltanschauung” in the *Schweizerische Zeitschrift fur Psychologie und ihre Anwendungen*, I (1943):3, 157–64; and in *Aufsatze zur Zeitgeschichte* (Zurich, 1946), pp. 57–72. Previously trans. by Mary Bnner in *Essays on Contemporary Events* (London, 1947), for other contents of which see Vol. 10, Part III.—EDITORS.]

[1] [Delivered as a lecture to a scientific meeting of the Senate of the Swiss Academy of Medical Science. Zurich, May 12, 1945. Published as “Medizin und Psychotherapie.” *Bulletin der Schweizerischen Akademie der medizinischen Wissenschaften*, I (1945): 5, 315–25.—EDITORS.]

1 [A lecture delivered to a Section of the Swiss Society for Psychotherapy at its fourth annual meeting (1941). The Section was formed to further the interests of psychotherapists in Switzerland. The lecture was published as “Die Psychotherapie in der Gegenwart” in the *Schweizerische Zeitschrift für Psychologie und ihre Anwendungen*, IV (1945), 1–18; and in *Aufsatze zur Zeitgeschichte* (Zurich, 1946), pp. 25–56, from which the present translation was made. Previously trans. by Mary Briner in *Essays on Contemporary Events* (London, 1947); cf. Vol. 10, Part III.—EDITORS.]

2 As we know, the parental imago is constituted on the one hand by the personally acquired image of the personal parents, but on the other hand by the parent archetype which exists a *priori*, i.e., in the pre-conscious structure of the psyche.

3 In *Explorations in Personality*.

4 * “Labyrinthus medicorum errantium,” p. 199 (“Theorica medica”). [The word θεωρία originally meant looking about one at the world.—TRANS.]

5 * “De ente Dei,” p. 226.

6 Cf. *Psychology and Alchemy*, and “Psychology and Religion.”

7 Khunrath, *Von hylealischen… Chaos*.

8 Pestalozzi said (*Ideen*, p. 187): “None of the institutions, measures, and means of education established for the masses and the needs of men in the aggregate, whatever shape or form they may take, serve to advance human culture. In the vast majority of cases they are completely worthless for that purpose and are directly opposed to it. Our race develops its human qualities in essence only from face to face, from heart to heart. Essentially it develops only in little intimate circles which gradually grow in graciousness and love, in confidence and trust. All the means requisite for the education of man, which serve to make him truly humane and to bring him to mankindliness, are in their origin and essence the concern of the individual and of such institutions as are closely and intimately attached to his heart and mind. They never were nor will be the concern of the masses. They never were nor will be the concern of civilization.” [See note 10 below.—TRANS.]

9 Ibid., pp. 189f.: “The collective existence of our race can only produce civilization, not culture. [See note 10 below.—TRANS.] Is it not true, do we not see every day, that in proportion as the herd-like aggregations of men become more important, and in proportion as officialdom, which represents the legal concentration of the power of the masses, has freer play and wields greater authority, the divine breath of tenderness is the more easily extinguished in the hearts of the individuals composing these human aggregations and their officials, and that the receptivity to truth which lies deep in man’s nature perishes within them to the same degree?

“The collectively unified man, if truly he be nothing but that, sinks down in all his relations into the depths of civilized corruption, and sunk in this corruption, ceases to seek more over the whole earth than the wild animals in the forest seek.”

10 More than a hundred years ago, in times not so unlike our own, Pestalozzi wrote (ibid., p. 186): “The race of men cannot remain socially united without some ordering power. Culture has the power to unite men as individuals, in independence and freedom, through law and art. But a cultureless civilization unites them as masses, without regard to independence, freedom, law or art, through the power of coercion.” [N.B. Pestalozzi evidently subscribes to the Germanic distinction between *Kultur* and *Zivilisation*, where the latter term is employed in a pejorative sense. The idea is that culture, deriving ultimately from tillage and worship (*cultus*), is a natural organic growth, whereas civilization is an affair of the city (*civis*) and thus something artificial. Cf. note 9 above.—TRANS.]

1 [First published as “Grundfragen der Psychotherapie,” *Dialectica* (Neuchâtel). V (1951): 1, 8–24. —EDITORS.]

2 “The Relations Between the Ego and the Unconscious,” chs. II and III.

3 Kerényi, *Asklepios*, p. 83.

4 [*Literally weltanschaulich*, ‘pertaining to one’s view of the world.’ *Weltanschauung* is usually translated as ‘philosophy (of life),’ ‘world-view,’ etc. In the present context, ‘theoretical’ is used in the precise sense of the Greek θεωρία, which meant ‘looking about the world,’ ‘contemplation’; hence ‘speculation.’ Cf.p. 100, note 4.—TRANS.]

5 Freud, “Leonardo da Vinci” (Standard edn., Vol. XI).

6 E.g., Psalms 147:3 and Job 5:18.

7 [From ἐκφορέω, ‘to carry forth.’—TRANS.]

8 The concept of the archetype is a specifically psychological instance of the “pattern of behaviour” in biology. Hence it has nothing whatever to do with inherited ideas, but with modes of behaviour.

9 * Rhine, *Extra-Sensory Perception*.

[1] Written in English. First published in the *British Journal of Psychology* (London), *Medical Section*, II (1921): i, 13–22. Revised and published in *Contributions to Analytical Psychology* (London and New York, 1928), pp. 282–94. Some verbal alterations to the revised version have been made here.—EDITORS.]

[2] [Both published 1920.]

[1] [* Delivered as a lecture, “Die praktische Verwendbarkeit der Traumanalyse,” at the 6th General Medical Congress for Psychotherapy, Dresden, April 1931, and published in the *Bericht* of the Congress; republished in *Wirklichkeit der Seele* (Zurich, 1934), pp. 68–103. Trans. from the *Bericht* by Gary F. Baynes and W. S. Dell in *Modern Man in Search of a Soul* (New York and London, 1933). —EDITORS.]

[2] [This dream is discussed at greater length in “Child Development and Education,” pars. 117ff.—EDITORS.]

[3] “Komplex und Mythos.”

[1] [First published, in book form, as *Die Psychologie der Übertragung* (Zurich, 1946).—EDITORS.]

[2] This is not to say that a transference never occurs in such cases. The negative form of transference in the guise of resistance, dislike, or hate endows the other person with great importance from the start, even if this importance is negative; and it tries to put every conceivable obstacle in the way of a positive transference. Consequently the symbolism so characteristic of the latter–the synthesis of opposites–cannot develop.

[1] “Accipe canem corascenum masculum et caniculum Armeniae” (Take a Corascene dog and an Armenian bitch).—“De alchimiae difficultatibus,” *Theatrum chemicum*, I, p. 163. A quotation from Kalid (in the *Rosarium*, *Artis auriferae*, II, p. 248) runs: “Accipe canem coetaneum et catulam Armeniae” (Take a Coetanean dog and an Armenian bitch). In a magic papyrus, Selene (moon) is called *κύων* (bitch).—Paris MS. Z 2280, in Preisendanz, *Papyri Graecae Magicae*, I, p. 142. In Zosimos, dog and wolf.—Berthelot, *Alchimistes grecs*, III, xii, 9. [No translation of the words *corascenum* and *coetaneum* has been attempted, as we are advised that they are probably corrupt, or may indicate geographical names.—EDITORS.]

[2] Zosimos, in Berthelot, *Alch. grecs*, III, xii, 9.

[3] The classical passage is to be found in Senior, *De chemia*, p. 8: “Tu mei indiges, sicut gallus gallinae indiget” (You need me as the cock needs the hen).

[4] Numerous pictures exist in the literature.

[5] Kekulé, *Lehrbuch der organischen Chemie*, I, pp. 624f., and Fierz-David, *Die Entwicklungsgeschichte der Chemie*, pp. 235ff.

[6] Zacharius, “Opusculum,” *Theatr. chem*., I, p. 826.

[7] “Consilium coniugii,” *Ars chemica*, p. 259. Cf. *Aurora consurgens*, I, Ch. II: “Est namque donum et sacramentum Dei atque res divina” (For she [Wisdom] is a gift and sacrament of God and a divine matter).

[8] This does not contradict the fact that the *coniunctio* motif owes its fascination primarily to its archetypal character.

[9] Cf. the detailed account in Rahner, “Mysterium lunae.”

[10] A collection of the classical sources is to be found in Klinz, ‘I*ερὸς γάμος*.

[11] Bousset, *Hauptprobleme der Gnosis*, pp. 69ff., 263f., 315ff.; Leisegang, *Der heilige Geist*, I, p. 235.

[12] I call unconscious processes “hypothetical” because the unconscious is by definition not amenable to direct observation and can only be inferred.

[13] I am not considering the so-called homosexual forms, such as father-son, mother-daughter, etc. In alchemy, as far as I know, this variation is alluded to only once, in the “Visio Arislei” (*Art. aurif*., I, p. 147): “Domine, quamvis rex sis, male tamen imperas et regis: masculos namque masculis coniunxisti, sciens quod masculi non gignunt” (Lord, though thou art king, yet thou rulest and governest badly; for thou hast joined males with males, knowing that males do not produce offspring).

[14] Freud says (*Introductory Lectures*, Part III, p. 455): “The decisive part of the work is achieved by creating in the patient’s relation to the doctor—in the ‘transference’—new editions of the old conflicts; in these the patient would like to behave in the same way as he did in the past.… In place of the patient’s true illness there appears the artificially constructed transference illness, in place of the various unreal objects of his libido there appears a single, and once more imaginary, object in the person of the doctor.” It is open to doubt whether the transference is always constructed artificially, since it is a phenomenon that can take place quite apart from any treatment, and is moreover a very frequent natural occurrence. Indeed, in any human relationship that is at all intimate, certain transference phenomena will almost always operate as helpful or disturbing factors.

[15] “Provided only that the patient shows compliance enough to respect the necessary conditions of the analysis, we regularly succeed in giving all the symptoms of the illness a new transference meaning and in replacing his ordinary neurosis by a ‘transference-neurosis’.…” (“Remembering, Repeating, and Working-Through,” P. 154.) Freud puts down a little too much to his own account

here. A transference is not by any means always the work of the doctor. Often it is in full swing before he has even opened his mouth. Freud's conception of the transference as a "new edition of the old disorder," a "newly created and transformed neurosis," or a "new, artificial neurosis" (*Introductory Lectures*, III, p. 444), is right in so far as the transference of a neurotic patient is equally neurotic, but this neurosis is neither new nor artificial nor created: it is the same old neurosis, and the only new thing about it is that the doctor is now drawn into the vortex, more as its victim than as its creator.

16 Freud had already discovered the phenomenon of the "counter-transference." Those acquainted with his technique will be aware of its marked tendency to keep the person of the doctor as far as possible beyond the reach of this effect. Hence the doctor's preference for sitting behind the patient, also his pretence that the transference is a product of his technique, whereas in reality it is a perfectly natural phenomenon that can happen to him just as it can happen to the teacher, the clergyman, the general practitioner, and—last but not least—the husband. Freud also uses the expression "transference-neurosis" as a collective term for hysteria, hysterical fears, and compulsion neuroses (Ibid., p. 445).

17 The effects of this on the doctor or nurse can be very far-reaching. I know of cases where, in dealing with borderline schizophrenics, short psychotic intervals were actually "taken over," and during these periods it happened that the patients were feeling more than ordinarily well. I have even met a case of induced paranoia in a doctor who was analysing a woman patient in the early stages of latent persecution mania. This is not so astonishing since certain psychic disturbances can be extremely infectious if the doctor himself has a latent predisposition in that direction.

18 Freud himself says ("Observations on Transference-Love," p. 380) of this: "I can hardly imagine a more senseless proceeding. In doing so, an analyst robs the phenomenon of the element of spontaneity which is so convincing and lays up obstacles for himself in the future which are hard to overcome." Here Freud stresses the "spontaneity" of the transference, in contrast to his views quoted above. Nevertheless those who "demand" the transference can fall back on the following cryptic utterance of their master ("Fragment of an Analysis of a Case of Hysteria," p. 116): "If the theory of analytic technique is gone into, it becomes evident that transference is [something necessarily demanded]." ["… that transference is an inevitable necessity," as in the authorized translation, is to stretch the meaning of Freud's "etwas notwendig Gefordertes."—TRANS.]

19 Suggestion happens of its own accord, without the doctor's being able to prevent it or taking the slightest trouble to produce it.

20 "Good advice" is often a doubtful remedy, but generally not dangerous because it has so little effect. It is one of the things the public expects in the *persona medici*.

21 Simon Magus' Helen (Selene) is another excellent example.

22 The reader will know that I do not understand *libido* in the original Freudian sense as *appetitus sexualis*, but as an *appetitus* which can be defined as psychic energy. See "On Psychic Energy."

23 This is the view I have put forward as an explanation of certain processes in "The Theory of Psychoanalysis."

24 Cf. Frazer, *Taboo and the Perils of the Soul*, pp. 54ff.

25 The same phenomenon can be seen on a smaller scale, but no less clearly, in the apprehension and depression which precede any special psychic exertion, such as an examination, a lecture, an important interview, etc.

26 Where the *nigredo* is identified with the *putrefactio* it does not come at the beginning, as for example in fig. 6 of our series of pictures from the *Rosarium philosophorum (Art. aurif.*, II, p. 254). In Mylius, *Philosophia reformata*, p. 116, the *nigredo* appears only in the fifth grade of the work,

during the “putrefactio, quae in umbra purgatorii celebratur” (putrefaction which is celebrated in the darkness of Purgatory); but further on (p. 118), we read in contradiction to this: “Et haec denigratio est operis initium, putrefactionis indicium” etc. (And this *denigratio* is the beginning of the work, an indication of the putrefaction).

27 “Unconscious identity” is the same as Lévy-Bruhl’s *participation mystique*. Cf. *How Natives Think*.

28 A pictorial representation of this moment, in the form of a flash of lightning and a “stone-birth,” is to be found in my “A Study in the Process of Individuation,” Picture 2.

29 Because he is the “unknown father,” a theme to be met with in Gnosticism. See Bousset, *Hauptprobleme der Gnosis*, Ch. II, pp. 58–91.

30 Cf. Nicholas of Flüe’s vision of the threefold fountain arising in the square container (Lavaud, *Vie profonde de Nicolas de Flue*, p. 67, and Stöckli, *Die Visionen des seligen Bruder Klaus*, p. 19). A Gnostic text says: “In the second Father[hood] the five trees are standing and in their midst is a trapeza [τράπεζα]. Standing on the trapeza is an Only-begotten word [λόγος *μονοενής*].” (Baynes, *A Coptic Gnostic Treatise*, p. 70.) The trapeza is an abbreviation of τετράπεζα, a four-legged table or podium (ibid., p. 71). Cf. Irenaeus, *Contra haereses*, III, 11, where he compares the “fourfold gospel” with the four cherubim in the vision of Ezekiel, the four regions of the world, and the four winds: “ex quibus manifestum est, quoniam qui est omnium artifex Verbum, qui sedet super Cherubim et continet omnia, dedit nobis quadriforme Evangelium, quod uno spiritu continetur” (from which it is clear that He who is the Maker of all things, the Word [Logos] who sits above the Cherubim and holds all things together, gave unto us the fourfold gospel, which is contained in one spirit).

Concerning the kitchen, cf. Lavaud, *Vie profonde*, p. 66, and Stöckli, *Die Visionen*, p. 18.

31 This is not a metaphysical statement but a psychological fact.

32 As regards the bird with the flowering twig, see Figs, 2 and 3 infra.

33 Avalon, *The Serpent Power*, pp. 345f.

34 Freud, as we know, observes the transference problem from the standpoint of a personalistic psychology and thus overlooks the very essence of the transference–the collective contents of an archetypal nature. The reason for this is his notoriously negative attitude to the psychic reality of archetypal images, which he dismisses as “illusion.” This materialistic bias precludes strict application of the phenomenological principle without which an objective study of the psyche is absolutely impossible. My handling of the transference problem, in contrast to Freud’s, includes the archetypal aspect and thus gives rise to a totally different picture. Freud’s rational treatment of the problem is quite logical as far as his purely personalistic premises go, but both in theory and in practice they do not go far enough, since they fail to do justice to the obvious admixture of archetypal data.

35 The numerical proportion of latent to manifest psychoses is about equal to that of latent to active cases of tuberculosis.

36 The violent resistance, mentioned by Freud, to the rational resolution of the transference is often due to the fact that in some markedly sexual forms of transference there are concealed collective unconscious contents which defy all rational resolution. Or, if this resolution is successful, the patient is cut off from the collective unconscious and comes to feel this as a loss.

37 Cf. Lully, “Testamentum,” *Bibliotheca chemica curiosa*, I, pp. 790ff., and Maier, *Symbola aureae mensae*, pp. 379f.

38 Pars. 342f.

39 Cf. “The Spirit Mercurius,” Part II, sec. 6.

40 Thus *Aurora consurgens*, II (*Art. aurif.*, I, pp. 185–246) closes with the words: “Et sic probata est medicina Philosophorum, quam omni [investiganti] fideli et pio praestare dignetur Deus omnipotens, unigenitusque filius Dei Dominus noster Jesus Christus, qui cum Patre et Spiritu sancto vivit et regnat, unus Deus per infinita saeculorum. Amen” (And this is the approved medicine of the philosophers, which may our Lord Jesus Christ, who liveth and reigneth with the Father and the Holy Ghost, one God for ever and ever, deign to give to every searcher who is faithful, pious, and of good will, Amen). This conclusion no doubt comes from the Offertorium (prayer during the *commixtio*), where it says: “… qui humanitatis nostrae fieri dignatus est particeps, Jesus Christus, Filius tuus, Dominus noster: qui tecum vivit et regnat in unitate Spiritus Sancti Deus per omnia saecula saeculorum. Amen.” (… who vouchsafed to become partaker of our humanity, Jesus Christ, Thy Son, our Lord: who liveth and reigneth with Thee in the unity of the Holy Ghost, one God, world without end. Amen.)

41 Cf. “Tractatus aureus,” *Ars chemica*, p. 21.

42 Kircher, “Oedipus Acgyptiacus,” II, Class X, Ch. V, p. 414. There is a connection between this text and the “Tabula smaragdina”; cf. Ruska, *Tabula smaragdina*, p. 217.

43 The *Rosarium (Art. aurif.*, II, p. 230) says: “Et scias, quod haec est longissima via, ergo patientia et mora sunt necessariae in nostro magisterio” (And you must know that this is a very long road; therefore patience and deliberation are needful in our magistery). Cf. *Aurora consurgens*, I, Ch. 10: “Tria sunt necessaria videlicet patientia mora et aptitudo instrumentorum” (Three things are necessary, namely: patience, deliberation, and skill with the instruments).

44 *Rosarium*, p. 231. What the alchemist sees in “metallic form” the psychotherapist sees in man.

45 Here I must expressly emphasize that I am not dabbling in metaphysics or discussing questions of faith, but am speaking of psychology. Whatever religious experience or metaphysical truth may be in themselves, looked at empirically they are essentially psychic phenomena, that is, they manifest themselves as such and must therefore be submitted to psychological criticism, evaluation, and investigation. Science comes to a stop at its *own* borders.

46 Cf. “The Spirit Mercurius,” Part II, sec. 10.

47 The alchemists also liken him to Lucifer (“bringer of light”), God’s fallen and most beautiful angel. Cf. Mylius, *Phil* ref., p. 18.

48 Cf. “Psychology and Religion,” pars. 6f.

49 I use the classical etymology of *religio* and not that of the Church Fathers.

50 Maier, *Symb. aur. mens.*, p. 386.

51 *Epistula LV* (Migne, *P.L.*, vol. 33, cols. 208–09).

52 *Homiliae in Leviticum*, V, 2 (Migne, *P.G.*, vol. 12, col. 449).

53 Ibid.

54 *Hom. in Librum Regnorum*, 1, 4.

55 “Hounded from one bride-chamber to the next.”—*Faust*, Part I.

56 For the same process in the individual psyche, see *Psychology and Alchemy*, pars. 44ff.

57 Cf. Ruska, *Turba*, Sermo XIX, p. 129. The term comes from the Book of El-Habib (ibid., p. 43).

58 “Spiritus alme,/illustrator hominum,/horridas nostrae/mentis purga tenebras.” (Sublime spirit, enlightener of mankind, purge the horrible darknesses of our mind.)–Notker Balbulus, *Hymnus in Die Pentecostes* (Migne, *P.L.*, vol. 131, cols. 1012–13).

59 Hoghelande, “De alchemiae difficultatibus,” p. 139.

60 *Acta Joannis*, 98 (cf. James, *Apocryphal New Testament*, p. 255):… kal ἁρμονία σοφίας· σοφία δὲ οὖσα ἐν ἁρμονίᾳ ὑπάρχουσιν δεξιοὶ καὶ ἀριστεροί, δυνάμεις, ἐξουσίαι, ἀρχαὶ καὶ δαίμονες, ἐνέργειαι… (“… Harmony of wisdom, but when there is wisdom the left and the right are in harmony: powers, principalities, archons, daemons, forces…”).

61 Cardan (*Somniorum synesiorum*…) is an excellent example of one who examined his own dreams.

62 As regards the work of reinterpretation, see my “Brother Klaus.” Also Lavaud, *Vie profonde*, Ch. III, “La Grande Vision.”

1 [These mottoes, where they appear, translate the verses under the woodcuts in the figures. Figs. 1–10 are full pages reproduced from the Frankfurt first edition (1550) of the *Rosarium philosophorum*. The textual quotations, however, are taken from the version printed in *Art. aurif.*, II (Basel, 1593), except for the poem at par. 528.—EDITORS.]

2 The “Cons, coniug.” (*Ars chemica*, p. 147) says: “Et locus generationis, licet sit artificialis, tamen imitatur naturalem, quia est concavus, conclusus” etc. (The place of gestation, even though it is artificial, yet imitates the natural place, since it is concave and closed). And (p. 204): “Per matricem, intendit fundum cucurbitae” (By matrix he means the root of the gourd).

3 Cf. Ruska, *Turba*, p. 163.

4 Cf. Hortulanus (Ruska, *Tabula smaragdina*, p. 186): “Unde infinitae sunt partes mundi, quas omnes philosophus in tres partes dividit scil, in partem Mineralem Vegetabilem et Animalem.… Et ideo dicit habens tres partes philosophiae totius mundi, quae partes continentur in unico lapide scil. Mercurio Philosophorum” (Hence the parts of the world are infinite, all of which the philosopher divides into three parts, namely mineral, vegetable, animal.… And therefore he claims to have the three parts of the philosophy of the whole world, which parts are contained in the single stone, namely the Mercurius of the Philosophers). Ch. 13: “Et ideo vocatur lapis iste perfectus, quia in se habet naturam mineralium et vegetabilium et animalium. Est enim lapis triunus et unus, quatuor habens naturas” (And this stone is called perfect because it has in itself the nature of mineral, vegetable, and animal. For the stone is triple and one, having four natures).

5 Cf. the alchemical doctrine of the *increatum: Psychology and Alchemy*, pars. 430ff.

6 A quotation based on Rosinus in *Rosarium*, p. 249, says: “Triplex in nomine, unus in esse.” Cf. the threefold fountain of God in the vision of Brother Klaus (Lavaud, *Vie profonde*, p. 66). The actual Rosinus passage (itself a quotation from Rhazes) runs (*Art. aurif.*, I, p. 300): “Lapis noster cum mundi creato[re] nomen habet, qui est trinus et unus” (Our stone has a name common with the Creator of the world who is triple and one). Senior (*De chemia*, p. 45) says: “Aes nostrum est sicut homo, habens spiritum, animara et corpus. Propterea dicunt sapientes: Tria et Tria sunt unum. Deinde dixerunt: in uno sunt tria.” (Our copper is like a man, having spirit, soul, and body. Therefore the wise men say: Three and Three are One. Further they said: In One there are Three.) Cf, also Zosimos (Berthelot, *Alch. grecs*, III, vi, 18). The mercurial fountain recalls the πηγὴ μεγάλη of the Peratics (Hippolytus, *Elenchos*, V, 12, 2), which forms one part of the threefold world. The three parts correspond to 3 gods, 3 λόγοι, 3 spirits (νοῖ, 3 men. This triad is opposed by a Christ equipped with all the properties of the triad and himself of triadic nature, coming from above, from the ἀγεννησία, before the separation. (Here I prefer Bernays’ reading πρὸ τῆς [cf. *Elenchos*, p. 105] because it makes more sense.)

7 In Abū’l-Qāsim the lapis is called *al-shaitan*, ‘Satan’; cf. Holmyard, “Abū’l-Qāsim al-Irāqī,” p. 422.

8 The serpent is also *triplex nomine*, as the inscriptions “animalis,” “vegetabilis,” “mineralis” show.

9 *Psychology and Alchemy*, fig. 20.

10 “Practica,” *Art. aurif.*, I, p. 321: “Ipsa sunt duo fumi complectentes duo lumina” (They are the two vapours enveloping the two lights).

11 We find the same motif in the frontispiece of Colonna, *Le Songe de Poliphile*, as the leaves which fall from the tree rooted in the fire. See *Psychology and Alchemy*, fig. 4.

12 Cf. *Aurora consurgens*, I, Ch. IV: “Evil odours and vapours that infect the mind of the laborant.” Also Morienus (*Art. aurif.*, II, p. 34): “Hic enim est odor, qui assimilatur odori sepulcrorum.…” (For this is the odour that is similar to the stench of the graves…).

13 The interpretation of uneven numbers as masculine and of even numbers as feminine is general in alchemy and originated in antiquity.

14 [For the 2nd edn., there has been a change in the sequence of pars. 405–407, in order to place Jung's summarizing statement in what would seem to be its logical position, i.e., present par. 407.—EDITORS.]

15 Cf. Jacobi, *Psychology of C. G. Jung*, Diagrams IV–VII.

16 For the soul as square, circle, or sphere see *Psychology and Alchemy*, pars. 109 and 439, n. 47.

17 The above remarks should be understood only psychologically and not in the moral sense. The "deed" as such is not the essence of the psychic life-process but only a part of it, although a very important part.

18 Incidentally, Johann Valentin Andreae, the real author of the *Chymical Wedding*, also wrote a Faust drama in Latin entitled *Turbo, sive Moleste et frustra per cuncta divagans ingenium* (1616), the story of a man who knew everything and was finally disappointed, but who found his salvation in the *contemplatio Christi*. The author, a theologian in Württemberg, lived from 1586 to 1654.

19 I have dealt with this psychological process at length in *Two Essays*, pars. 224f., 380f.

20 An allusion to madness. The *afflictio animae* is mentioned in Olympiodorus (Berthelot, *Alch. grecs*, II. iv, 43). Morienus (*Art. aurif.*, II, p. 18), and Maier (*Symb. aur. mens.*, p. 568), and in Chinese alchemy (Wei Po-yang, "An Ancient Chinese Treatise," pp. 241–45).

21 God is the source, river, and sea which all contain the same water. The Trinity is a life that "proceeds from itself to itself, by way of itself"—Vansteenberghe, *Le Cardinal Nicolas de Cues*, pp. 296f.

[1] *Debita materia*, meaning the *prima materia* of the process.

[2] *Rosarium*, p. 219: “Nota bene: In arte nostri magisterii nihil est celatum a Philosophis excepto secreto artis, quod non licet cuiquam revelare: quodsi fieret, ille malediceretur et indignationem Domini incurreret et apoplexia moreretur. Quare omnis error in arte existit ex eo quod debitam materiam non accipiunt. Igitur venerabili utimini natura, quia ex ea et per earn et in ea generatur ars nostra et non in alio: et ideo magisterium nostrum est opus naturae et non opificis.”

[3] Ruska, *Turba*, Sermo XXIX, p. 137.

[4] Cf. *Aurora consurgens*, I, where the parables “Of the Black Earth,” “Of the Flood of Waters and of Death,” “Of the Babylonish Captivity,” are followed by the parable “Of the Philosophic Faith” with its avowal of the *lumen de lumine*. Cf. also Avicenna, “Declaratio lapidis physici,” *Theatr. chem*., IV, p. 990.

[5] A corruption of “alchymia.”

[6] *De incertitudine et vanitate omnium scientiarum*, Ch. XC.

[7] Later, Agrippa (ibid.) says one or two other things about the stone: “As to that unique and blessed substance, besides which there is no other although you may find it everywhere, as to that most sacred stone of the philosophers—almost I had broken my oath and made myself a desecrator of temples by blurting out its name—I shall nevertheless speak in circumlocutions and dark hints, so that none but the sons of the art and the initiates of this mystery shall understand. The thing is one which has neither too fiery nor too earthen a substance.… More I am not permitted to say, and yet there be greater things than these. However. I consider this art—with which I have a certain familiarity—as being the most worthy of that honour which Thucydides pays to an upright woman, when he says that the best is she of whom least is said either in praise or blame.” Concerning the oath of secrecy, see also Senior, *De chemia*, p. 92: “Hoc est secretum, super quo iuraverunt, quod non indicarent in aliquo libro” (This is the secret which they promised on oath not to divulge in any book).

[8] Both texts are supposed to have been in circulation in manuscript from about 1610, according to F. Maack, editor of Rosencreutz’s *Chymische Hochzeit*, pp. xxxviiif. [They are to be found there at pp. 47–84.—EDITORS.]

[9] A kind of “rosie cross” can also be seen in Luther’s crest.

[10] Cf. *Psychology and Alchemy*, par. 436, and Reitzenstein and Schaeder, *Studien zum antiken Synkretismus*.

[11] Waite, *The Secret Tradition*.

[12] Wei Po-yang, p. 241.

[13] The union of “like with like” in the form of homosexual relationships is to be found in the “Visio Arislei” (*Art. aurif*., I, p. 147), marking the stage preceding the brother-sister incest.

[14] According to Freud, these projections are infantile wish-fantasies. But a more thorough examination of neuroses in childhood shows that such fantasies are largely dependent on the psychology of the parents, that is, are caused by the parents’ wrong attitude to the child. Cf. “Analytical Psychology and Education,” pars. 216ff.

[15] Hence *Aurora consurgens*, I, Ch. VI, says: “… and all my bones are troubled before the face of my iniquity.” Cf. Ps. 37 : 4 (D.V.): “… there is no peace for my bones, because of my sins.”

[16] Cf. *Two Essays*, pars. 296ff. [Also “Concerning the Archetypes, with Special Reference to the Anima Concept” and *Aion*, ch. 3.—EDITORS.]

[17] It may be helpful to remind the reader that in Rider Haggard’s *She* there is a description of this “royal” figure. Leo Vincey, the hero, is young and handsome, the acme of perfection, a veritable

Apollo. Beside him there stands his fatherly guardian, Holly, whose resemblance to a baboon is described in great detail. But inwardly Holly is a paragon of wisdom and moral rectitude—even his name hints at “holy.” In spite of their banality both of them have superhuman qualities, Leo as well as the devout “baboon.” (Together they correspond to the *sol et umbra eius.*) The third figure is the faithful servant who bears the significant name of Job. He stands for the long-suffering but loyal companion who has to endure both superhuman perfection and subhuman baboonishness. Leo may be regarded as the sun-god; he goes in quest of “She” who “dwells among the tombs” and who is reputed to kill her lovers one by one—a characteristic also ascribed by Benoit to his “Atlantide”—and to rejuvenate herself by periodically bathing in a pillar of fire. “She” stands for Luna, and particularly for the dangerous new moon. (It is at the *synodus* of the *novilunium*— i.e., at the *coniunctio* of the Sun and Moon at the time of the new moon—that the bride kills her lover.) The story eventually leads, in *Ayesha*, another novel of Haggard’s, to the mystical hierosgamos.

18 The alchemical pairs of opposites are often arranged in such quaternios, as I shall show in a later work. [Cf. *Mysterium Coniunctionis*, pp. 6ff., and *Aion*, pp. 250ff.—EDITORS.]

19 Naumann (ed.), *Isländische Volksmärchen*, No. 8, pp. 47ff.

20 Guterman (trans.), *Russian Fairy Tales*, pp. 351ff.

21 The Russian arch-witch.

22 *The Native Tribes of S.E. Australia*, p. 157; cf. Frazer, *Totemism and Exogamy*, I, p. 306.

23 Layard, *Stone Men of Malekula*, pp. 62ff.

24 Hocart, *Kings and Councillors*, p. 265.

25 [Pars. 433ff. incorporate corrections made by Dr. John Layard in 1955 with reference to his own writings and authorized by Jung in the 1958 Swiss edition. Later corrections made by Dr. Layard (1965) are given in square brackets.—EDITORS.]

26 Ibid., pp. 157, 193.

27 Layard, *Stone Men of Malekula*, pp. 85ff.

28 Hocart, *Kings and Councillors*, pp. 244ff.

29 Ibid., p. 250.

30 Layard, “The Incest Taboo,” pp. 270ff.

31 I would remind the reader that Rex and Regina are usually brother and sister or sometimes mother and son.

32 If we think at all when doing these things, it must be a preconscious or rather an unconscious act of thought. Psychological explanations cannot very well get on without such an hypothesis.

33 *The Northern Tribes of Central Australia*, p. 74.

34 Layard, “The Incest Taboo,” p. 284.

35 Ibid., p. 293.

36 In this system a man marries his [mother’s mother’s brother’s daughter’s daughter].

37 Hocart, *Kings and Councillors*, p. 259.

38 In China, for instance, one can still find vestiges of the twelve-class system.

39 Layard, “The Incest Taboo,” pp. 281ff.

40 Ibid., p. 284. Perhaps I may point out the similar conclusions reached in *Symbols of Transformation*, pars. 464ff.

[1] An Arabic treatise whose origin is still obscure. It is printed in *Ars chemica*, and (with scholia) in *Bibl. chem. curiosa*, I, pp. 400ff.

[2] This passage is rather different in ‘the original text (*Ars chemica*, p. 14): “in quo est nisus tuae dispositionis, et adunatio cuiuslibet sequestrati.” Cf. *Psychology and Alchemy*, par. 385 and n. 87.

[3] *Art. aurif.*, II, pp. 227–38.

[4] Cf. Cant. 5:3: “I have put off my garment.”

[5] Original is illegible: ?vgan.

[6] This is the reading of the 1593 edition. The first edition of 1550 has “vivificat.”

[7] The dove is also the attribute of the goddess of love and was a symbol of *amor coniugalis* in ancient times.

[8] Cf. Joannes Lydus, *De mensibus*, II, 11: “The sixth day they ascribe to Phosphorus [morning star], who is the begetter of warmth and generative moisture [γονίμως ὑγραίνοντι]. Perhaps this is the son of Aphrodite, like Hesperus the evening star, as appeared to the Greeks. Aphrodite we could call the nature of the visible universe, the first-born Hyle which the oracle names star-like [Ἀστερίαν] as well as heavenly. The number 6 is most skilled in begetting [γεννητικώτατος], for it is even and uneven, partaking both of the active nature on account of the uneven [περιττὸν also means “superfluous” or “excessive”], and of the hylical nature on account of the even, for which reason the ancients also named it marriage and harmony. For among those that follow the number 1, it is the only number perfect in all its parts, being composed of these: its halves of the number 3, its thirds of the number 2, and its sixths of the number 1 [6 = 3 + 2 + 1]. And they say also that it is both male and female, like Aphrodite herself, who is of male and female nature and is accordingly called hermaphroditic by the theologians. And another says that the number 6 is soul-producing [or belongs to the ψυχογονία, ψυχογονικός], because it multiplies itself into the worldsphere [ἐπιπεδούμενος = πολλαπλασιασμός], and because in it the opposites are mingled. It leads to like-mindedness [ὁμόνοιαν] and friendship, giving health to the body, harmony to songs and music, virtue to the soul, prosperity to the state, and forethought [πρόνοιαν] to the universe.”

[1] Dorn, “Speculativae philosophiae,” p. 303: “Studio philosophorum comparatur putrefactio chemica…. Ut per solutionem corpora solvuntur, ita per cognitionem resolvuntur philosophorum dubia” (The chemical putrefaction can be compared with the study of the philosophers…. As bodies are dissolved through the *solutio*, so the doubts of the philosophers are resolved through knowledge).

[2] Instead of the meaningless “aqua foetum” I read “aqua foetida” (*Rosarium*, p. 241). Cf. “Cons, coniug.,” *Ars chemica*, p. 64: “Leo viridis, id est… aqua foetida, quae est mater omnium ex qua et per quam et cum qua praeparant.…” (The green lion, that is… the stinking water, which is the mother of all things, and out of it and through it and with it, they prepare…).

[3] *Rosarium*, p. 214. Cf. *Aurora consurgens*, I, Ch. XII, where the bride says of herself in God’s words (Deut. 32 : 39): “I will kill and I will make to live… and there is none that can deliver out of my hand.”

[4] *Rosarium*, p. 213.

[5] Ibid., p. 237. This goes back to Senior, *De chemia*, pp. 19, 31, 33.

[6] Cf. *Psychology and Alchemy*, fig. 159.

[7] “Addam et processum,” *Theatr. chem*., III, pp. 8538. Cf. *Psychology and Alchemy*, pars. 480ff.

[8] *Aurora consurgem*, I, Ch. IX, “qualis pater talis filius, talis et Spiritus Sanctus et hi tres unum sunt, corpus, spiritus et anima, quia omnis perfectio in numero ternario consistit, hoc est mensura, numero et pondere” (Like as the Father is, so is the Son, and so also is the Holy Spirit, and these three are One, body, spirit, and soul, for all perfection consisteth in the number three, that is, in measure, number, and weight.)

[9] “Anima vocatur Rebis.” “Exercitationes in Turbam,” *Art. aurif*., I, p. 180.

[10] According to Firmicus Maternus (*Mathesis* V, pref., ed, Kroll and Skutsch, II, p. 3), Luna is “humanorum corporum mater.”

[11] Psychologically one should read *mens* for *spiritus*.

[12] Sometimes the spirit is the *vinculum*, or else the latter is a *natura ignea* (Zacharius, “Opusculum,” *Theatr. chem*., I, p. 887).

[13] Cf. “De arte chimica.” *Art. aurif*., I, pp. 584ff, and Mylius, *Phil, ref*., p. 9.

[14] Cf. “Turba,” *Art. aurif*., I, p. 180: “… Spiritus et corpus unum sunt mediante anima, quae est apud spiritum et corpus. Quod si anima non esset, tunc spiritus et corpus separarentur ab invicem per ignem, sed anima adiuncta spiritui et corpori, hoc totum non curat ignem nec ullam rem mundi.” (… The spirit and the body are one, the soul acting as a mediator which abides with the spirit and the body. If there were no soul, the spirit and the body would be separated from each other by the fire, but because the soul is joined to the spirit and the body, this whole is unaffected by fire or by any other thing in the world.)

[15] Cf. Winthuis, *Das Zweigeschlechterwesen*.

[16] I do not, of course, mean the synthesis or identification of two individuals, but the conscious union of the ego with everything that has been projected into the “You.” Hence wholeness is the product of an intrapsychic process which depends essentially on the relation of one individual to another. Relationship paves the way for individuation and makes it possible, but is itself no proof of wholeness. The projection upon the feminine partner contains the anima and sometimes the self.

[17] Cf. *Psychology and Alchemy*, index.

[18] *Rosarium*, p. 369.

[19] *Psychology and Alchemy*, pars. 430ff.

[20] P. 251.

[21] Cf. Frobenius, *Das Zeitalter des Sonnengottes*.

[22] “Visio Arislei,” *Art. aurif.*, I, p. 148: “Mansimus in tenebris undarum et intenso aestatis calore ac maris perturbatione” (We remained in the darkness of the waves and in the intense heat of summer and the perturbation of the sea).

[23] Cf. the birth of Mithras “from the sole heat of libido” (de solo aestu libidinis). Jerome, *Adversus Jovinianum* (Migne, *P.L.*, vol. 23, col. 246). In Arabic alchemy, too, the fire that causes the fusion is called “libido.” Cf. “Exercitationes in Turbam.”

Art. aurif., I, p. 181: “Inter supradicta tria (scil., corpus, anima, spiritus) inest libido,” etc. (Between the aforementioned three, i.e., body, soul, spirit, there is a libido).

[24] See the inscription to fig. 5a:

> “But here King Sol is tight shut in,
> And *Mercurius philosophorum* pours over him.”

The sun drowning in the mercurial fountain (*Rosarium*, p. 315) and the lion swallowing the sun (p. 367) both have this meaning, which is also an allusion to the *ignea natura* of Mercurius (Leo is the House of the Sun). For this aspect of Meicurius see “The Spirit Mercurius,” Part II, sec. 3.

[1] *Rosarium*, p. 248. Quotation from Kalid, “Liber secretorum alchemiae,” *Art. aurif.*, I, p. 340. [Cf. par. 353, n. 1.—EDITORS.]

[2] P. 247.

[3] p. 248.

[4] Kalid, “Liber secretorum alchemiae,” *Art. aurif.*, I, p. 340: “Et dixie. Hermes patri suo: Pater timeo ab inimico in mea mansione. Et dixit: Fili, accipe canem masculum Corascenem et caniculam Armeniae et iunge in simul et parient canem coloris coeli et imbibe ipsum una siti ex aqua maris: quia ipse custodiet tuum amicum et custodiet te ab inimico tuo et adiuvabit te ubicumque sis, semper tecum existendo in hoc mundo et in alio.” (And Hermes said to his father: Father, I am afraid of the enemy in my house. And he said: My son, take a Corascene dog and an Armenian bitch, join them together, and they will beget a dog of a celestial hue, and if ever he is thirsty, give him sea water to drink: for he will guard your friend, and he will guard you from your enemy, and he will help you wherever you may be, always being with you, in this world and in the next.)

[5] *Rosarium*, p. 248. The radiant quality (στιλβων) is characteristic of Mercurius and also of the first man, Gayomart or Adam. Cf. Christensen, *Les Types du premier homme*, pp. 22ff., and Kohut, “Die talmudisch-midraschische Adamssage,” pp. 68, 72, 87.

[6] The “Practica Mariae” (*Art. aurif.*, I, p. 321) makes the two into four: “[Kibrich et Zubech]… ipsa sunt duo fumi complectentes duo Iumina” (They are the two vapours enveloping the two lights). These four evidently correspond to the four elements, since we read on p. 320: “… si sunt apud homines omnia 4 elementa, dixit compleri possent et complexionari et coagulari eorum fumi.…” (If there are in men all 4 elements, he says, their vapours could be completed and commingled and coagulated).

[7] See Lambspringk, “Figurae,” *Musaeum hermeticum*.

[8] Frontispiece to Colonna, *Le Songe de Poliphile*. See *Psychology and Alchemy*, fig. 4.

[9] Hence the ambivalent saying in Mylius, *Phil. ref.*, p. 182: “In habentibus symbolum facilis est transitus” (For those who have the symbol the passage is easy).

[10] Cf. Kalid, “Liber trium verborum,” *Art aurif.*, I, pp. 355f.

[11] “No more shall you stay a prisoner
Wrapped in darkest obfuscation;
New desires call you upwards
To the higher copulation.”—*West-östlicher* Divan.

[1] “Tractatulus Avicennae,” *Art. aurif.*, I, p. 426.

[2] Cf. *Aurora*, I, Ch. XII (after John 12:24). Hortulanus (Ruska, *Tabula*, p. 186): “Vocatur [lapis] etiam granum frumenti, quod nisi mortuum fuerit, ipsum solum manet,” etc. (It [the stone] is also called the grain of wheat, which remains itself alone, unless it dies). Equally unhappy is the other comparison, also a favourite: “Habemus exemplum in ovo quod putrescit primo, et tunc gignitur pullus, qui post totum corruptum est animal vivens” (We have an example in the egg: first it putrefies and then the chick is born, a living animal sprung from the corruption of the whole).—*Rosarium*, p. 255.

[3] Cf. Ruska, *Turba*, p. 139: “Tune autem, doctrinae filii, illa res igne indiget, quousque illius corporis spiritus vertatur et per noctes dimittatur, ut homo in suo tumulo, et pulvis fiat. His peractis reddet ei Deus et animam suam et spiritum, ac infirmitate ablata confortatur ilia res… quemadmodum homo post resurrectionem fortior fit,” etc. (But, sons of the doctrine, that thing will need fire, until the spirit of its body is changed and is sent away through the nights, like a man in his grave, and becomes dust. When this has happened, God will give back to it its soul and its spirit and, with all infirmity removed, that thing is strengthened… as a man becomes stronger after the resurrection.)

[4] Cf. the ψυχογονία in Lydus’ account of the hexad, supra, par. 451, n. 8.

[5] Cf. Senior, *De chemia*, p. 16: “… et reviviscit, quod fuerat morti deditum, post inopiam magnam” (What had been given over to death, comes to life again after great tribulation).

[6] For the alchemist, this had a precedent in Gen. 2:17: “for in the day that thou eatest thereof thou shalt surely die.” Adam’s sin is part of the drama of the creation. “Cum peccavit Adam, eius est anima mortua” (When Adam sinned his soul died), says Gregory the Great (Epist. CXIV, Migne, *P.L.*, vol. 77, col. 806).

[7] *Art. aurif.*, II, p. 324.

[8] The *nigredo* appears here not as the initial state but as the product of a prior process. The time-sequence of phases in the *opus* is very uncertain. We see the same uncertainty in the individuation process, so that a typical sequence of stages can only be constructed in very general terms. The deeper reason for this “disorder” is probably the “timeless” quality of the unconscious, where conscious succession becomes simultaneity, a phenomenon I have called “synchronicity.” [Cf. Jung, “Synchronicity: An Acausal Connecting Principle.”] From another point of view we would be justified in speaking of the “elasticity of unconscious time” on the analogy of the equally real “elasticity of space.” For the relations between psychology and atomic physics, see Meier, “Moderne Physik.”

[9] Ezek. 8 : 14: “… behold, there sat women weeping for Tammuz.”

[10] Berthelot, *Alch. grecs*, II, i, 3: ‘H φύσις τῇ φύσει τέρπεται, καὶ ἡ φύσις τὴν φύσιν νικᾷ καὶ ἡ φύσις τὴν φύσιν κρατεῖ·

[11] Merlinus probably has as little to do with Merlin the magician as “King Artus” with King Arthur. It is more likely that Merlinus is “Merculinus,” a diminutive form of Mercurius and the pseudonym of some Hermetic philosopher. “Artus” is the Hellenistic name for Horus. The form “Merqûlius” and “Marqûlius” for Mercurius is substantiated in Arabic sources. Jûnân ben Marqûlius is the Greek Ion, who according to Byzantine mythology is a son of Mercurius (Chwolsohn, *Die Ssabier* I, p. 796). Al-Maqrizi says: “The Merqûlians… are the Edessenes who were in the neighbourhood of Harran,” obviously the Sabaeans (ibid., II, p. 615). The Ion in Zosimos (Berthelot, *Alch. grecs*, III, i, 2) probably corresponds to the above Ion. [Cf. “The Visions of Zosimos,” par. 86, n. 4.—EDITORS.]

[12] Merlinus, “Allegoria de arcano lapidis,” *Art. aurif.*, I, pp. 392ff.: “Rex autem… bibit et rebibit, donee omnia membra sua repleta sunt, et omnes venae eius inflatae” (But the king drinks and drinks

again until all his limbs are full and all his veins inflated). [Cf. *Mysterium Coniunctionis*, pp. 266f.—EDITORS.]

[13] In the "Tractatus aureus" (*Mus. herm*., p. 51) the king drinks the "aqua pernigra," here described as "pretiosa et sana," for strength and health. He represents the new birth, the self, which has assimilated the "black water," i.e., the unconscious. In the Apocalypse of Baruch the black water signifies the sin of Adam, the coming of the Messiah, and the end of the world.

[14] *Aurora*, II, in *Art. aurif*., I, p. 196.

[15] Hence the warning: "Cave ab hydropisi et diluvio Noe" (Beware of dropsy and the flood of Noah).—Ripley, *Omnia opera chemica*, p. 69.

[16] Cf. *Psychology and Alchemy*, pars. 456f.

[17] One of several versions.

[18] This is meant only as a psychological and not as a metaphysical parallel.

[19] Cf. *Psychological Types*, pars. 434ff.

[1] "Tractatus aureus," *Mus. herm.*, p. 47.

[2] Quotation from a source unknown to me, given as "Sorin" in *Rosarium*, p. 264.

[3] One such case is described in Meier, "Spontanmanifestationen," p. 290.

[4] *Art. aurif.*, II, p. 264: "Et eorum aquas sua aqua continere, si qua non est aqua, forma ignea verae aquae."

[5] Remembering the rule that every proposition in psychology may be reversed with advantage, I would point out that it is always a bad thing to accentuate the conscious attitude when this has shown itself to be so strong in the first place as violently to suppress the unconscious.

[6] *Art. aurif.*, II, p. 265.

[7] *The Dark Night of the Soul*.

[8] Ventura, "De ratione conficiendi lapidis," *Theatr. chem.*, II, p. 260. There is in the gold a "quiddam essentiale Divinum" (something of Divine essence) ("Tractatus Aristotelis," *Theatr. chem.*, V, p. 892). "Natura est vis quaedam insita rebus.… Deus est natura et natura Deus, a Deo oritur aliquid proximum ei" (Nature is a certain force innate in things.… God is Nature and Nature is God, and from God originates something very near to him).—Penotus, "Quinquaginta septem canones," *Theatr. chem.*, II, p. 153. God is known in the *linea in se reducto* of the gold (Maier, *De circulo physico quadrato*, p. 16).

[9] Hippolytus, *Elenchos*, VII, 26, 10.

[10] Angelus Silesius, *Cherubinischer Wandersmann*, Book IV, p. 194: "The work that God loves best and most wants done/Is this: that in you he can bear his son." Book II, p. 103: "There where God bends on you his spirit mild/Is born within the everlasting child."

[1] Cf. Judges 6 : 36ff.

[2] Cf. “The Spirit Mercurius,” II, sec. 2.

[3] *Art. aurif.*, II, pp. 275f. Cf. Senior, *De chemia*, pp. 17–18: “Dixit iterum Maria: Aqua, quam iam memoravi, est rex de coelo descendens et terra cum humore suo suscepit eum et retinetur aqua coeli cum aqua terrae propter servitium suum et propter arenam suam honorat earn et congregatur aqua in aquam, Alkia in Alkiam et dealbatur Alkia cum Astuam.” In the Arabic text “Astua” appears also as “Alkia”; “al-kiyān” = “vital principle” (Stapleton, “Three Arabic Treatises,” p. 152). “Alkia” occurs in the “Liber Platonis quartorum” (p. 152) in the sense of “vital principle” or “libido.”

[4] Azoth is the arcane substance (cf. Senior, *De chemia*, p. 95) and the lato is the black substance, a mixture of copper, cadmium, and orichalcum (ἐλατρόν; see Du Cange, *Glossarium*).

[5] *Rosarium*, p. 277. This oft-repeated quotation is to be found in the treatise of Morienus (“Sermo de transmutatione metallorum,” *Art. aurif.*, II, pp. 7ff.), which appears to have been translated from the Arabic by Robert of Chartres in the 12th century. Morienus attributes it to the obsolete author Elbo Interfector. It must be of very early origin, but hardly earlier than the 8th century.

[6] Reference to the “Tab. smarag.”: “Itaque vocatus sum Hermes Trismegistus habens tres partes philosophiae totius mundi” (Therefore I am called Hermes Trismegistus, having the three parts of the philosophy of the whole world).

[7] A classic of Arabic origin, put into Latin between the 11th and 12th centuries. The *Turba* quotation in the *Rosarium* comes from “Rosinus ad Sarratantam,” *Art. aurif.*, I, pp. 284f. The *Turba* (ed. Ruska, p. 158) has only: “Siccum igitur humido miscete, quae sunt terra et aqua; ac igne et aere coquite, unde spiritus et anima desiccantur” (Therefore mix the dry with the moist, which are earth and water, and cook them with fire and air, whence spirit and soul are dried out).

[8] A reference to the saying of Morienus (“De transmutatione metallorum,” *Art. aurif.*, II, p. 21): “.… omnis festinatio [scil, festinantia] ex parte Diaboli est” (… all haste is of the devil). Hence the *Rosarium* says (p. 352): “Ergo qui patientiam non habet ab opere manum suspendat, quia impedit cum ob festinantiam credulitas” (Therefore, he who hath not patience, let him hold back his hand from the work, for credulity will ensnare him if he hasten).

[9] *Rosarium*, p. 277. Identical with *Aurora consurgens*, I, Ch. I.

[10] John 4 : 13–14: “… Whosoever drinketh of this water shall thirst again: But whosoever drinketh of the water that I shall give him shall never thirst; but the water that I shall give him shall be in him a well of water springing up into everlasting life.”

[11] Koch, “Cusanus-Texte,” p. 124: “In puteo Jacob est aqua, quae humano ingenio quaesita et reperta est, et potest significari quoad hoc philosophia humana, quae penetratione laboriosa sensibilium quaeritur. In Verbo autem Dei, quod est in profundo vivi putei, scl. humanitatis Christi, est fons refrigerans spiritum. Et ita notemus puteum sensibilem Jacob, puteum rationalem, et puteum sapientialem. De primo puteo, qui est naturae animalis et altus, bibit pater, filii et pecora; de secundo, qui altior in orizonte naturae, bibunt filii hominum tantum, scl. ratione vigentes, et philosophi vocantur; de tertio, qui altissimus, bibunt filii excelsi, qui dicuntur dii et sunt veri theologi. Christus secundum humanitatem puteus quidem dici potest altissimus.… In illo profundissimo puteo est fons sapientiae, quae praestat felicitatem et immortalitatem… portat vivus puteus fontem suae vitae ad sitientes, vocat sitientes ad aquas salutares, ut aqua sapientiae salutaris reficiantur.”

[12] Ibid., p. 132: “Qui bibit spiritum, bibit fontem scaturientem.”

[13] Ibid., p. 134: “Adhuc nota, quod intellectus nobis datus est cum virtute seminis intellectualis: unde in se habet principium fontale, mediante quo in seipso generat aquam intelligentiae, et fons ille non potest nisi aquam suae naturae producere, scl. humanae intelligentiae, sicut intellectus principii,

‘quod-libet est vel non est’ producit aquas metaphysicales, ex quibus alia flumina scientiarum emanant indesinenter.”

14 Cardan, *Somniorum synesiorum:* “Unumquodque somnium ad sua generalia deducendum est.”

15 “… subtilietur lapis, donec in ultimam subtilitatis puritatem deveniat et ultimo volatilis fiat” (The stone should be subtilized until it reaches the ultimate purity of refinement and becomes, in the end, volatile).—*Rosarium*, p. 351. Or again (ibid., p. 285): “Sublimatio est duplex: Prima est remotio superfluitatis, ut remaneant partes purissimae a faecibus elementaribus segregatae sicque virtutem quintae essentiae possideant. Et haec sublimatio est corporum in spiritum reductio cum scilicet corporalis densitas transit in spiritus subtilitatem.” (Sublimation is twofold: The first is the removal of the superfluous so that the purest parts shall remain, free from elementary dregs, and shall possess the quality of the quintessence. The other sublimation is the reduction of the bodies to spirit, i.e., when the corporeal density is transformed into a spiritual subtlety.)

16 Cf. *Psychological Types*, Definitions 21 (in Baynes edn., Def. 20), 35, 47, 53.

17 [Eugen Steinach (1861–1944), Austrian physiologist who experimented with rejuvenation by grafting animal glands.—EDITORS.]

[1] Cf. Lambspringk’s *Symbols*, *Mus. Herm.*, p. 355, with the verses:

“Nidus in sylva reperitur in quo Hermes suos pullos habet, Unus semper conatur volatum, Alter in nido manere gaudet, Et alter alterum non dimittit.”	(A nest is found in the forest in which Hermes has his birds. One always tries to fly away, The other rejoices in the nest to stay And will not let the other go.)

This image comes from Senior, *De chemia*, p. 15: “Abscisae sunt ab eo alae et pennae et est manens, non recedens ad superiora” (Its wings are cut off and its feathers, and it is stationary, not returning to the heights). Likewise Stolcius de Stolcenberg, *Viridarium chymicum*, Fig. XXXIII. In Maier, *De circulo*, p. 127, the opposites are represented as “vultur in cacumine montis et corvus sine alis” (a vulture on the peak of the mountain and a raven without wings). Cf. “Tractatus aureus,” *Ars chem.*, pp. 11–12, and “Rosinus ad Sarratantam,” *Art. aurif.*, I, p. 316.

[2] Cf. “Paracelsus as a Spiritual Phenomenon,” pars. 201f.

[3] *Psychology and Alchemy*, fig. 235.

[4] *Art. aurif.*, II, p. 377: “De Tinctura alba: Si parentes dilecti mei de vita gustaverint et lacte mero lactati fuerint et meo albo inebriati fuerint et in lectulo meo nupserint, generabunt filium Lunae, qui totam parentelam suam praevalebit. Et si dilectus meus de tumulo rubeo petrae potaverit et fontem matris suae gustaverit et inde copulatus fuerit et vino meo rubeo et mecum inebriatus fuerit et in lecto [meo] mihi amicabiliter concubuerit, et in amore meo sperma suum cellulam meam subintraverit, concipiam et ero praegnans et tempore meo pariam filium potentissimum, dominantem et regnantem prae cunctis regibus et principibus terrae, coronatum aurea corona victoriae, ad omnia a Deo altissimo, qui vivit et regnat in seculorum secula.” Cf. “Cons, coniug.,” *Ars chem.*, p. 129, and “Rosinus ad Sarratantam,” pp. 291ff.

[5] The style of the pictures dates them to the 16th cent., but the text may be a century older. Ruska (*Tab. smarag.*, p. 193) assigns the text to the 14th cent. The later dating, 15th cent. (Ruska, *Turba*, p. 342), is probably the more accurate.

[6] *Psychology and Alchemy*, par. 500.

[7] See ibid., fig. 220.

[8] Cant. 3:11: “… see king Solomon in the diadem, wherewith his mother crowned him in the day of his espousals.” Gregory the Great comments that the mother is Mary “quae coronavit eum diademate, quia humanitatem nostram ex ea ipsa assumpsit.… Et hoc in die desponsationis eius… factum esse dicitur: quia quando unigenitus filius Dei divinitatem suam humanitati nostrae copulare voluit, quando.… Ecclesiam sponsam suam sibi assumere placuit: tunc… carnem nostram ex matre Virgine suscipere voluit” (who crowned him with the crown because he assumed our human nature from her. … And that is said to have been done on the day of his espousals, because, when the only-begotten son of God wished to join his divinity with our human nature, he decided to take unto himself, as his bride, the Church. Then it was that he willed to assume our flesh from his virgin mother).–St Gregory, *Super Cantica Canttcorum expositio*, ch. III (Migne, *P.L.*, vol. 79, col. 507.)

[9] “Gloria mundi,” *Mus. herm.*, p. 213.

[10] *Liber etymologiarum*, XIII, 14.

[11] *Psychology and Alchemy*, par. 92.

[12] Philalethes, “Introitus apertus,” *Mus. herm.*, p. 654.

[13] *De chemia*, p. 17.

[14] It is just possible that the idea of the *diadema* is connected with the cabalistic *Kether* (corona). The *Diadema purpureum* is *Malchuth*, “the female,” “the bride.” Purple relates to the *vestimentum*, an attribute to the Shekinah (the Divine Presence), which “enim est Vestis et Palatium Modi Tiphereth,

non enim potest fieri mentio Nominis Tetragrammati nisi in Palatio eius, quod est Adonai. Apellaturque nomine *Diadematis*, quia est Corona in capite mariti sui”(… is the Garment and the Palace of the Modus Tiphereth [Glory], for no mention can be made of the Four-Letter Name which is Adonai, except in His Palace. And it is called by the name of Diadem because it is the crown on the head of the husband)—Knorr von Rosenroth, *Kabbala denudala*, I, p. 131. “… Malchuth vocatur Kether nempe corona legis,” etc. (Malchuth is called Kether since it is the crown of the Law). “Sephirah decima vocatur Corona: quia est mundus Dilectionum, quae omnia circumdant,” *etc*. (The tenth Sephira [number] is called the crown, because it is the world of delights which surround all things).—Ibid., p. 487. “[Corona] sic vocatur Malchuth, quando ascendit usque ad Kether; ibi *enim existens est* Corona super caput mariti sui” ([The Crown] is called Malchuth when its ascends up to Kether; for there is the crown upon the head of the husband).—Ibid., p. 624. Cf. Goodenough, “The Crown of Victory in Judaism.”

15 Norton’s “Ordinall” (*Theatr, chem. britannicum*, p. 40) says:

“For greatly doubted evermore all suche,
That of this Scyence they may write too muche:
Every each of them tought but one pointe or twayne,
Whereby his fellowes were made certayne:
How that he was to them a Brother,
For every of them understoode each other;
Alsoe they wrote not every man to teache,
But to shew themselves by a secret speache:
Trust not therefore to reading of one Boke,
But in many Auctors works ye may looke;
Liber librum apperit saith Arnolde the great Clerke.”

“The Book of Krates” (Berthelot, *Moyen âge*, III, p. 52) says: “Your intentions are excellent, but your soul will never bring itself to divulge the truth, because of the diversities of opinion and of wretched pride.” Hoghelande (“De alch. diff.,” *Theatr. chem*., I, p. 155) says: “At haec [scientia]… tradit opus suum immiscendo falsa veris et vera falsis, nunc diminute nimium, nunc superabundanter, et sine ordine, et saepius praepostero ordine, et nititur obscure tradere et occultare quantum potest” (This [science] transmits its work by mixing the false with the true and the true with the false, sometimes very briefly, at other times in a most prolix manner, without order and quite often in the reverse order; and it endeavours to transmit [the work] obscurely, and to hide it as much as possible). Senior (De *chemia*, p. 55) says: “Verum dixerunt per omnia, Homines vero non intelligunt verba eorum… unde falsificant veridicos, et verificant falsificos opinionibus suis.… Error enim eorum est ex ignorantia intentionis eorum, quando audiunt diversa verba, sed ignota intellectui eorum, cum sint in intellectu occulto.” (They told the truth in regard to all things, but men do not understand their words… whence through their assumptions they falsify the verities and verify the falsities.… The error springs from ignorance of their [the writers’] meaning, when they hear divers words unknown to their understanding, since these have a hidden meaning.) Of the secret hidden in the words of the wise, Senior says: “Est enim illud interius subtiliter perspicientis et cognoscentis” (For this belongs to him who subtly perceives and is cognizant of the inner meaning). The *Rosarium* (p. 230) explains: “Ego non dixi omnia apparentia et necessaria in hoc opere, quia sunt aliqua quae non licet homini loqui” (So I have not declared all that appears and is necessary in this work, because there are things of which a man may not speak). Again (p. 274): “Talis materia debet tradi mystice, sicut poèsis fabulose et parabolice” (Such matters must be transmitted in mystical terms, like poetry employing fables and parables). Khunrath (*Von hyl. Chaos*, p. 21) mentions the saying: “Arcana publicata vilescunt” (secrets that are published become cheap)—words which Andreae used as a motto for his *Chymical Wedding*. Abū'l Qâsim Muhammad ibn Ahmad al-Simāwī, known as al-Irāqī, says in his "Book of the Seven Climes" (see Holmyard, "Abū'l-Qāsim," p. 410) regarding Jābir ibn Hayyān's method of instruction: "Then he spoke enigmatically concerning the composition of the External and the Internal.… Then he spoke darkly… that in the External there is no complete tincture and that the complete tincture is to be found only in the Internal. Then he spoke darkly… saying, Verily we have made the External nothing more than a veil over the Internal… that the Internal is like this and like that and he did not cease from this kind of behaviour until he had completely confused all except the most quick-witted of his pupils. …" Wei Po-yang (c. 142 A.D.) says: "It would be a great sin on my part not to transmit the Tao which would otherwise be lost to the world forever. I shall not write on silk lest the divine secret be unwittingly spread abroad. In hesitation I sigh.…" ("An Ancient Chinese Treatise," p. 243).

16 The parallel to this is the paradoxical relation of Malchuth to Kether, the lowest to the highest (see note 14 above).

17 P. 270.

18 He is thought to be identical with Joannes de Garlandia, who lived in the second half of the 12th cent. and wrote the "Commentarius in Tabulam smaragdinam," in *De alchemia* (1541).

19 Ibid., p. 365. Since the alchemists were, as "philosophers," the empiricists of the psyche, their terminology is of secondary importance compared with their experience, as is the case with empiricism generally. The discoverer is seldom a good classifier.

20 Thus Dom ("Physica Trismegisti," *Theatr. chem.*, I, p. 409) says: "Spagirica foetura terrestris caelicam naturam induat per ascensum, et deinceps suo descensu centri naturam terreni recipiat" (This earthly, spagyric birth clothes itself with heavenly nature by its ascent, and then by its descent visibly puts on the nature of the centre of the earth).

21 This explains why the projection usually has some influence on the carrier, which is why the alchemists in their turn expected the "projection" of the stone to bring about a transmutation of base metals.

22 The alchemists regarded the arrow as the *telum passionis* of Mercurius.

23 Rosencreutz, *The Chymical Wedding*, p. 212.

24 Waite, *Real History of the Rosicrucians*.

25 Intoxicants that induce delirious states can also release these processes, for which purpose datura (Jimson weed) and peyotl are used in primitive rites. See Hastings, *Encyclopedia*, IV, pp. 735f.

26 As this book was written in 1943, I leave this sentence as it stands, in the hope of a better world to come.

27 This process is described in the second of my *Two Essays*.

28 Cf. "Tractatulus Aristotelis," *Art. aurif.*, I, p. 371.

29 A good example of this is to be found in Angelus Silesius, *Cherubinischer Wandersmann*, Book III, no. 238:

> "God is made man and now is born—rejoice!
> Where then? In me, the mother of his choice.
> How should that be? My soul that Virgin Maid,
> My heart the manger and my limbs the shed.…"

30 In woman the animus produces very similar illusions, the only difference being that they consist of dogmatic opinions and prejudices which are taken over at random from somebody else and are never the product of her own reflection.

31 She is the Euthicia of the treatise of Rosinus (= Zosimos) in *Art. aurif.*, I, pp. 277ff.

32 The *Mutus liber* is reproduced as an appendix to Vol. I of the *Bibl. chem. curiosa*, 1702. For illustrations from the *Mutus Liber*, see figs. 11–13 of the present volume, and *Psychology and Alchemy*, index. We might mention John Pordage and Jane Leade (17th cent.) as another pair of alchemists. See infra.

33 *A Suggestive Inquiry into the Hermetic Mystery*.

34 John Pordage (1607–1681) studied theology and medicine in Oxford. He was a disciple of Jakob Boehme and a follower of his alchemical theosophy. He became an accomplished alchemist and astrologer. One of the chief figures in his mystical philosophy is Sophia. ("She is my divine, eternal, essential self-sufficiency. She is my wheel within my wheel," etc.—Pordage's *Sophia*, p. 21.)

35 The letter is printed in Roth-Scholz, *Deutsches Theatrum chemicum*, I, pp. 557–97. The first German edition of this "Philosophisches Send-Schreiben vom Stein der Weissheit" seems to have been published in Amsterdam in 1698. [The letter was evidently written in English, since the German version in Roth-Scholz, 1728–32, is stated to be "aus dem Englischen übersetzet." But no English edition or MS. can be traced at the British Museum, the Library of Congress, or any of the other important British and American libraries. Pordage's name does not occur among the alumni at Oxford. —EDITORS.]

36 One of the favourite allusions to the Song of Songs 7:2: "Thy navel is like a round goblet, which wanteth not liquor." Cf. also *Aurora consurgens*, I, Ch. XII.

37 The concluding passages are very reminiscent of the teachings of the "secta liberi spiritus," which were propagated as early as the 13th century by the Béguines and Beghards.

38 Hence Pordage's view is more or less in agreement with woman's conscious psychology, but not with her unconscious psychology.

39 Pordage, *Sophia*, Ch. I.

40 There is a modern work that gives an excellent account of the feminine world of symbols: Esther Harding's *Woman's Mysteries*.

41 Florence, Ashburnham 1166, 14th cent. They are reproduced as figs. 131 and 135 in *Psychology and Alchemy*.

42 The arrow refers to the *telum passionis* of Mercurius. Cf. "Cantilena Riplaei" in ibid., par. 491, and *Mysterium Coniunctionis*, pp. 285fr. Cf. also "The Spirit Mercurius," Part II, sec. 8, and St. Bernard of Clairvaux, *Sermones in Cantica*, XXX, 8 (Migne, *P.L.*, vol. 183, cols. 932–33): "Est et sagitta sermo Dei vivus et efficax et penetrabilior omni gladio ancipiti.… Est etiam sagitta electa amor Christi, quae Mariae animam non modo confixit, sed etiam pertransivit, ut nullam in pectore virginali particulam vacuam amore relinqueret." (God's word is an arrow; it is lively and effective and more penetrating than a double-edged sword.… And the love of Christ is a choice arrow too, which not only entered, but transfixed, the soul of Mary, so that it left no particle of her virgin heart free of love.)—Trans. by a priest of Mount Melleray, I, p. 346.

43 Cf. the Alaskan Eskimo tale "The Woman Who Became a Spider," in Rasmussen, *Die Gabe des Adlers*, pp. 121ff., and the Siberian tale "The Girl and the Skull," in Kunike (ed.), *Märchen aus Sibirien*, No. 31, where a woman marries a skull.

44 Ed. Macaulay, II, p. 35: motto of Book I. Cf. St. Bernard of Clairvaux, *Sermones in Cant.*, XXIX, 8 (Migne, *P.L.*, vol. 183, col. 933) (of Mary): "Et illa quidem in tota se grande et suave amoris vulnus accepit…" (And she indeed received a great and sweet wound of love in all her being).

1 “Numerus perfectus est denarius” (the perfect number is ten).—Mylius, *Phil. ref.*, p. 134. The Pythagoreans regarded the δεκάς as the τέλειος ἀριθμός.—Hippolytus, *Elenchos*, I, 2, 8. Cf. Joannes Lydus, *De mensibus*, 3, 4, and Proclus, *In Platonis Timaeum Commentaria*, 21 AB. This view was transmitted to alchemy through the *Turba* (pp. 300ff., “Sermo Pythagorae”). Dorn (“Congeries,” *Theatr. chem*. I, p. 622) says: “Quando quidem ubi Quaternarius et Ternarius ad Denarium ascendunt, eorum fit ad unitatem regressus. In isto concluditur arcano omnis occulta rerum sapientia.” (When the number four and the number three ascend to the number ten, they return to the One. In this secret all the hidden wisdom of things is contained.) But he denies (“Duellum animi,” (*Theatr. chem*., I, p. 545) that 1 + 2 + 3 + 4 = 10, since 1 is not a number, maintaining that the denarius comes from 2 + 3 + 4 = 9 + 1. He insists on the elimination of the devilish binarius (ibid., pp. 542ff.). John Dee (“Monas hieroglyphica,” *Theatr. chem*., II, p. 220) derives the denarius in the usual way: the *antiquissimi Latini philosophi* assumed that the *crux rectilinea* meant the denarius. The old author Artefius (probably an Arab) also derives the denarius by adding together the first four numbers (“Clavis”, *Theatr. chem*., IV, p. 222). But later he says that 2 is the first number, and he proceeds to make the following operation: 2 + 1 = 3, 2 + 2 = 4, 4 + 1 = 5, 4 + 3 = 7, 7 + 1 = 8, 8 + 1 = 9, 8 + 2 = 10, and says that “eodem modo centenarii ex denariis, millenarii vero ex centenariis procreantur” (in the same way the hundreds are produced out of the tens, and the thousands out of the hundreds). This operation can be regarded as either enigmatic or childish.

2 According to Hippolytus (*Elenchos*, IV, 43, 4), the Egyptians said that God was a μονὰς ἀδιαίρετος (an indivisible unity), and that 10 was a monad, the beginning and end of all number.

3 The denarius as an *allegoria Christi* is to be found in Rabanus Maurus, *Allegoriae in universam sanctam Scripturam* (Migne, *P.L.*, vol. 112, col. 907).

4 “Audi atque attende: Sal antiquissimum Mysterium! Cuius nucleum in Denario, Harpocratice, sile.” (Listen and pay heed: Salt is the oldest mystery. Hide its nucleus in the number ten, after the manner of Harpocrates.)—Khunrath, *Amphitheatrum*, p. 194. The salt is the salt of wisdom. Harpocrates is the genius of the secret mysteries. Cf. *Psychology and Alchemy*, figs. 52 and 253.

5 There is a parallel to this in the system of Monoïmos (Hippolytus, *Elenchos*, VIII, 12, 2ff.). The son of Oceanus (the Anthropos) is an indivisible monad and yet divisible: he is mother and father, a monad that is also a decad. “Ex denario divino statues unitatem” (Out of the divine number ten you will constitute unity).—Quotation from Job. Dausten in Aegidius de Vadis, “Dialogus,” *Theatr. chem*., II, p. 115. Dausten, or Dastyne, was probably an Englishman; certain authorities date him at the beginning of the 14th cent., others much later. See Ferguson, *Bibl. chem*., I, s.v. “Dausten.”

6 Norton’s “Ordinall,” *Theatr. chem, britannicum*, p. 48. Philalethes (“Fons chemicae veritatis,” *Mus. herm*., p. 802) says: “Qui semel adeptus est, ad Autumnum sui laboris pervenit” (He who has once found it has reached the harvest time of his work). This is a quotation from Johannes Pontanus, who lived about 1550 and was a physician and professor of philosophy at Königsberg. Cf. Ferguson, *Bibl. chem*., II, p. 212.

7 It is worth noting that St. John of the Cross pictures the ascent of the soul in ten stages.

8 “Ipsa omnia sunt ex uno et de uno et cum uno, quod est radix ipsius” (They are all from the One, and of the One, and with the One, which is the root of itself).—*Art. aurif*., II, p. 369.

9 Nicholas of Cusa, in his *De docta ignorantia*, regarded antinomial thought as the highest form of reasoning.

10 Cf. “Rosinus ad Sarratantam,” *Art. aurif*., I, p. 309: “Cuius [lapidis] mater virgo est, et pater non concubuit” (Its [the stone’s] mother is a virgin, and the father lay not with her).

11 Cf. Petrus Bonus, “Pretiosa margarita novella,” *Theatr. chem.*, V, p. 649: “Cuius mater virgo est, cuius pater foeminam nescit. Adhuc etiam noverunt, quod Deus fieri debet homo, quia in die novissima huius artis, in qua est operis complementum, generans et generatum fiunt omnino unum: et senex et puer et pater et filius fiunt omnino unum. Ita quod omnia vetera fiunt nova.” (Whose mother is a virgin and whose father knew not woman. They knew also that God must become man, because on the last day of this art, when the completion of the work takes place, begetter and begotten become altogether one. Old man and youth, father and son, become altogether one. Thus all things old are made new.)

12 Cf. Dante, *Paradiso*, XXXIII, i: “O Virgin Mother, daughter of thy son.”

13 “Sermo de transmutatione metallorum,” *Art, aurif.*, II, p. 37.

14 Cf. “Psychology and Religion,” pars. 95ff., 153ff.; and *Psychology and Alchemy*, pars. 342ff.

15 It goes without saying that these concepts offer no solution of any metaphysical problem. They neither prove nor disprove the immortality of the soul.

16 *Art. aurif.*, II, pp. 356f.: “Patet ergo quod Philosophorum Magister lapis est, quasi diceret, quod naturaliter etiam per se facit quod tenetur facere: et sic Philosophus non est Magister lapidis, sed potius minister. Ergo qui quaerit per artem extra naturam per artificium inducere aliquid in rem, quod in ea naturaliter non est, errat et errorem suum deflebit.” [The above translation follows the author’s German version. An equally likely translation of the “quasi diceret” clause would be: “as if it (the stone) were to say that it does of its own nature that which it is held to do.”—A.S.B.G.]

17 The Persian Gayomart is as broad as he is long, hence spherical in shape like the world-soul in Plato’s *Timaeus*. He is supposed to dwell in each individual soul and in it to return to God. See Reitzenstein and Schaeder, *Studien zum antiken Synkretismus*, p. 25.

18 Cf. “The Spirit Mercurius.”

19 Possibly from βαφὴ (*tinctura*) and μῆτις (skill, sagacity), thus roughly corresponding to the Krater of Hermes filled with *voũs*. Cf. Nicolai, *Versuch über die Beschuldigungen, welche dem Tempelherrenorden gemacht wurden*, p. 120; Hammer-Purgstall, *Mysterium Baphometis*, pp. 3ff.

20 Cf. *Psychology and Alchemy*, fig. 70, showing a snake ritual. There is no certain connection of snake worship with the Templars (Hammer-Purgstall, *Mémoire sur deux coffrets gnostiques*).

21 Anastasius Sinaïta, *Anagogicae contemplationes:* “Et cum vel suffocatus esset et perisset tenebrosus corvus Satan…” (And when the dark raven Satan [or: of Satan] was suffocated or had perished…). St. Ambrose, *De Noe et Arca*, I, 17 (Migne, *P.L.*, vol. 14, col. 411): “Siquidem omnis impudentia atque culpa tenebrosa est et mortuis pascitur sicut corvus…” (If indeed all shamelessness and guilt is dark and feeds on the dead like a raven…). Again, the raven signifies the sinners: St. Augustine, *Annotationes in Job*, I, xxviii, 41 (Migne, *P.L.*, vol. 34, col. 880): “Significantur ergo nigri [scl. corvi] hoc est peccatores nondum dealbati remissione peccatorum” (They signify the black [raven], i.e., the sinners not yet whitened by remission of their sins). Paulinus of Aquileia, *Liber exhortationis* (Migne, *P.L.*, vol. 99, col. 253): “anima peccatoris… quae nigrior corvo est” (The soul of a sinner… which is blacker than a raven).

22 *Art. aurif.*, II, p. 359. See *Psychology and Alchemy*, fig. 54.

23 For further pictures of the Rebis see ibid., Index, s.v. “hermaphrodite.”

24 The identification of the *prima materia* with God occurs not only in alchemy but in other branches of medieval philosophy as well. It derives from Aristotle and its first appearance in alchemy is in the Harranite “Treatise of Platonic Tetralogies” (“Liber Platonis Quartorum,” *Theatr. chem.*, V). Mennens (“Aureum vellus,” *Theatr. chem.*, V, p. 334) says: “Nomen itaque quadriliterum Dei sanctissimam Trinitatem designare videtur et materiam, quae et umbra eius dicitur et a Moyse Dei

posteriora vocatur” (Therefore the four-letter name of God seems to signify the Most Holy Trinity and the Materia, which is also called his shadow, and which Moses called his back parts). Subsequently this idea crops up in the philosophy of David of Dinant, who was attacked by Albertus Magnus. “Sunt quidam haeretici dicentes Deum et materiam primam et νοῦν sive mentem idem esse” (There are some heretics who say that God and the prima materia and the nous or mind are the same thing).—*Summa Theologica*, I, 6, qu. 29, memb. 1 art. 1, par. 5 (*Opera*, ed. Borgnet, vol. 31, p. 294). Further details in Krönlein, “Amalrich von Bena,” pp. 303ff.

25 The idea of the hermaphrodite is seemingly to be met with in later Christian mysticism. Thus Pierre Poiret (1646–1719), the friend of M*me* Guyon, was accused of believing that, in the millennium, propagation would take place hermaphroditically. The accusation was refuted by Cramer (Hauck, *Realencyklopädie*, XV, p. 496), who showed that there was nothing of this in Poiret’s writings.

26 It is interesting to see how this theory once more joined forces with alchemy in Herbert Silberer’s book, *Problems of Mysticism and Its Symbolism*.

27 *De docta ignorantia*, II, 3: “Maximum autem est, cui nihil opponitur, ubi et Minimum est Maximum.”

28 “Ultra hanc coincidentiam creare cum creari es tu Deus.”

29 *De conjecturis*, II, 14: “Homo enim Deus est, sed non absolute, quoniam homo. Humane igitur est Deus. Homo etiam mundus est, sed non contracte omnia, quoniam homo. Est igitur homo μικρόκοσμος.”

30 *Of Learned Ignorance* (trans. Heron), p. 173: “Debet autem in his profundis omnis nostri humani ingenii conatus esse, ut ad illam se elevet simplicitatem, ubi contradictoria coincidunt.”

[1] Of these I would draw attention only to the series contained in *Mutus liber*, where the adept and his *soror mystica* are shown performing the *opus*. The first picture (fig. 11) shows an angel waking the sleeper with a trumpet; in the second picture (fig. 12), the pair of alchemists kneel on either side of the Athanor (furnace) with the sealed phial inside it, and above them are two angels holding the same phial, which now contains Sol and Luna, the spiritual equivalents of the two adepts. The third picture (fig. 13) shows, among other things, the sotor catching birds in a net and the adept hooking a nixie with rod and line: birds, being volatile creatures, stand for thoughts or the pluralistic animus, and the nixie corresponds to the anima. The undisguisedly psychic character of this portrayal of the *opus* is probably due to the fact that the book was written comparatively late—1677.

EDITORIAL NOTE

Personality as the expression of the wholeness of man is defined by Jung as an adult ideal whose conscious realization through individuation is the aim of human development in the second half of life. It is to the study of this aim that Jung has devoted his main attention in all his later work. It is manifest that in childhood and adolescence the ego is brought into being and firmly established; no account of individuation, therefore, would be complete without a psychological outline of the early formative period of development.

The present volume is a collection of Professor Jung's papers on child psychology and education, of which the three lectures on "Analytical Psychology and Education" are the chief item. Jung regards the psychology of parents and educators as of the greatest importance in the maturation and growth to consciousness of the children—especially so in the case of those who are unusually gifted. He emphasizes that an unsatisfactory psychological relationship between the parents may be an important cause of psychogenic disorders in childhood. It has been thought relevant to include Jung's paper on "Marriage as a Psychological Relationship" and, finally, to link up the problems of childhood with those of individuation in the adult by adding the essay which gives the present volume its title.

The essay "Child Development and Education" is presented here for the first time under this title. It previously appeared as one of the four lectures on "Analytical Psychology and Education," published in *Contributions to Analytical Psychology;* yet it had been delivered on a different occasion from the three others, its subject-matter is different, and it is not included by Jung in *Psychologie und Erziehung*, which contains the three other lectures. It contains a significant textual change by the author: an important statement in paragraph 106 on the subject of archetypal images in the dreams of children. Editorial reference is given to the privately printed record of Jung's seminars on the subject.

Only the essay “The Gifted Child” and the introduction to Frances Wickes’s book *Analyse der Kinderseele* have not previously been translated into English, apart from the brief alteration mentioned above. But the author has considerably revised the essays on education, so that much new matter is to be found in this volume, which will, it is hoped, help to set forth Jung’s position in regard to child psychology.

TRANSLATOR’S NOTE

With the exception of the “Introduction to Wickes’s *Analyse der Kinderseele*” and “The Gifted Child,” all the papers in the present volume were previously translated by various hands and published in *Collected Papers on Analytical Psychology* (2nd edition, London, 1917, and New York, 1920), *Contributions to Analytical Psychology* (London and New York, 1928), and *The Integration of the Personality* (New York, 1939; London, 1940). Several of them, as indicated in the footnotes at the beginning of each paper, have since been revised and expanded by the author. I would like to express my thanks to the late Dr. A. A. Brill, Mr. Stanley Dell, and in particular to Mrs. Cary F. Baynes, for permission to make full use of the earlier texts in preparing the present revised versions.

PSYCHIC CONFLICTS IN A CHILD

[**The third of a series of lectures on “The Association Method**,” delivered on the 20th anniversary of the opening of Clark University, Worcester, Massachusetts, September, 1909. The original version was published under the title “Über Konflikte der kindlichen Seele,” *Jahrbuch für psychoanalytische und psychoputhologische Forschungen*, II (1910), 33ff. It was translated by A. A. Brill and published in the *American Journal of Psychology*, XXI (1910), in a Clark University anniversary volume (1910), and in *Collected Papers on Analytical Psychology* (1st edn., London, 1916; 2nd edn., London, 1917, and New York, 1920). The revised version, of which this present essay is a translation, appeared in *Psychologie und Erziehung* (Zurich, 1946). The first two lectures comprising “The Association Method” were never published in German but were included in the aforementioned 1910 and 1916 publications. See Vol. 2 of the *Coll. Works.*—EDITORS.]

FOREWORD TO THE SECOND EDITION

I am publishing this little study just as it is, without making any alterations for the second edition. Although in point of fact our conceptions have been considerably modified and extended since these observations first appeared in 1910, I do not feel that the subsequent modifications would justify me in describing the views put forward in the first edition as basically false, an imputation that has been laid against me in certain quarters. On the contrary, just as the observations here recorded have retained their value as facts, so also have the conceptions themselves. But no conception is ever all-embracing, for it is always dominated by a point of view. The point of view adopted in this work is psycho-biological. It is naturally not the only one possible, indeed there are several others. Thus, more in accord with the spirit of Freudian psychology, this little piece of child psychology could be regarded from the purely hedonistic standpoint, the psychological process being conceived as a movement dominated by the pleasure principle. The main motives would then be the desire for and the striving towards the most pleasurable, and hence the most satisfying, realization of fantasy. Or, following Adler's suggestion, one could regard the same material from the standpoint of the power principle, an approach which is psychologically just as legitimate as that of the hedonistic principle. Or one could employ a purely logical approach, with the intention of demonstrating the development of logical processes in the child. One could even approach the matter from the standpoint of the psychology of religion and give prominence to the earliest beginnings of the God-concept. I have been content to steer a middle course that keeps to the psycho-biological method of observation, without attempting to subordinate the material to this or that hypothetical key principle. In so doing I am not, of course, contesting the legitimacy of such principles, for they are all included in our human nature; but only a very one-sided specialist would think of declaring as universally valid the heuristic principle that had proved its particular value for his discipline or for his individual method of observation. The essence of human psychology, precisely because so many different possible principles exist, can never be fully comprehended under any one of them, but only under the totality of individual aspects.

The basic hypothesis of the view advanced in this work is that sexual interest plays a not inconsiderable role in the nascent process of infantile thinking, an hypothesis that should meet with no serious opposition. A contrary hypothesis would certainly come up against too many well-observed facts, quite apart from its being extraordinarily improbable that a fundamental instinct of such cardinal importance for human psychology should not make itself felt in the infantile psyche from the very beginning.

On the other hand I also lay stress on the significance of *thinking* and the importance of concept-building for the solution of psychic conflicts. It should be sufficiently clear from what follows that the initial sexual interest strives only figuratively towards an immediate sexual goal, but far more towards the development of thinking. Were this not so, the solution of the conflict could be reached solely through the attainment of a sexual goal, and not through the mediation of an intellectual concept. But precisely the latter is the case, from which we may conclude that infantile sexuality is not to be identified outright with adult sexuality, since adult sexuality cannot be adequately replaced by concept-building, but is in most cases only satisfied with the real sexual goal, namely the tribute of normal sexual functioning which nature exacts. On the other hand, we know from experience that the infantile beginnings of sexuality can also lead to real sexual functioning—masturbation—when the conflicts are not resolved. The building of concepts, however, opens out to the libido a channel that is capable of further development, so that its continual, active realization is assured. Given a certain intensity of conflict, the absence of concept-building acts as a hindrance which thrusts the libido back into its initial sexuality, with the result that these beginnings or buddings are brought prematurely to an abnormal pitch of development. This produces an infantile neurosis. Gifted children in particular, whose mental demands begin to develop early on account of their intelligent disposition, run a serious risk of premature sexual realization through the suppression of what their parents and teachers would call an unsuitable curiosity.

As these reflections show, I do not regard the thinking function as just a makeshift function of sexuality which sees itself hindered in its pleasurable realization and is therefore compelled to pass over into the thinking function; but, while perceiving in infantile sexuality the beginnings of a future sexual function, I also discern there the seeds of higher spiritual functions. The fact that infantile conflicts can be resolved through concept-building speaks in favour of this, and also the fact that even in adult life the vestiges of infantile sexuality are the seeds of vital spiritual functions. The fact that adult sexuality grows out of this polyvalent germinal disposition does not prove that infantile sexuality is "sexuality" pure and simple. I therefore dispute the rightness of Freud's idea of the "polymorphous-perverse" disposition of the child. It is simply a *polyvalent* disposition. If we proceeded according to the Freudian formula, we should have to speak, in embryology, of the ectoderm as the brain, because from it the brain is ultimately developed. But much also develops from it besides the brain, for instance the sense organs and other things.

FOREWORD TO THE THIRD EDITION

Since this paper first appeared, almost thirty years have gone by. Yet it would seem that this little work has not given up the ghost, but is in increasing demand with the public. In one or two respects, certainly, it has never grown stale, firstly because it presents a simple series of facts such as occur repeatedly and are found to be much the same everywhere; secondly because it demonstrates something of great practical and theoretical importance, namely the characteristic striving of the child's fantasy to outgrow its "realism" and to put a "symbolic" interpretation in the place of scientific rationalism. This striving is evidently a natural and spontaneous expression of the psyche, which for that very reason cannot be traced back to any "repression" whatsoever. I stressed this particular point in my Foreword to the second edition, and my mention of it there has not lost its topicality, since the myth of the polymorphous sexuality of the child is still sedulously believed in by the majority of specialists. The repression theory is as grossly overestimated as ever, while the natural phenomena of psychic transformation are accordingly underestimated, if not entirely ignored. In 1912, I made these phenomena the subject of a compendious study, which cannot be said even now to have penetrated the intellects of psychologists as a class. I trust therefore that the present modest and factual report will succeed in rousing the reader to reflection. Theories in psychology are the very devil. It is true that we need certain points of view for their orienting and heuristic value; but they should always be regarded as mere auxiliary concepts that can be laid aside at any time. We still know so very little about the psyche that it is positively grotesque to think we are far enough advanced to frame general theories. We have not even established the empirical extent of the psyche's phenomenology: how then can we dream of general theories? No doubt theory is the best cloak for lack of experience and ignorance, but the consequences are depressing: bigotedness, superficiality, and scientific sectarianism.

To document the polyvalent germinal disposition of the child with a sexual terminology borrowed from the stage of fully-fledged sexuality is a dubious undertaking. It means drawing everything else in the child's make-up into the orbit of sexual interpretation, so that on the one hand the concept of sexuality is blown up to fantastic proportions and becomes nebulous, while on the other hand spiritual factors are seen as warped and stunted instincts. Views of this kind lead to a rationalism which is not even remotely capable of doing justice to the essential polyvalence of the infantile disposition. Even though a child may be preoccupied with matters which, for adults, have an undoubtedly sexual complexion, this does not prove that the nature of the child's preoccupation is to be regarded as equally sexual. For the cautious and conscientious investigator sexual terminology, as applied to infantile phenomena, can be deemed at most a professional *façon de parler*. I have my qualms about its appropriateness.

Apart from a few small improvements I am allowing this paper to appear once again in unaltered form.

December, 1938

C. G. J.

PSYCHIC CONFLICTS IN A CHILD

[1] About the time when Freud published his report on the case of "Little Hans,"[1] I received from a father who was acquainted with psychoanalysis a series of observations concerning his little daughter, then four years old.

[2] These observations have so much that bears upon, and supplements, Freud's report on "Little Hans" that I cannot refrain from making this material accessible to a wider public. The widespread incomprehension, not to say indignation, with which "Little Hans" was greeted, was for me an additional reason for publishing my material, although it is nothing like as extensive as that of "Little Hans." Nevertheless, it contains points which seem to confirm how typical the case of "Little Hans" is. So-called "scientific" criticism, so far as it has taken any notice at all of these important matters, has once more proved overhasty, seeing that people have still not learned first to examine and then to judge.

[3] The little girl to whose sagacity and intellectual sprightliness we are indebted for the following observations is a healthy, lively child of emotional temperament. She has never been seriously ill, nor had she ever shown any trace of "nervous" symptoms.

[4] Livelier systematic interests awakened in the child about her third year; she began to ask questions and to spin wishful fantasies. In the report which now follows we shall, unfortunately, have to give up the idea of a consistent exposition, for it is made up of anecdotes which treat of one isolated experience out of a whole cycle of similar ones, and which cannot, therefore, be dealt with scientifically and systematically, but must rather take the form of a story. We cannot dispense with this mode of exposition in the present state of our psychology, for we are still a long way from being able in all cases to separate with unerring certainty what is curious from what is typical.

[5] When the child, whom we will call Anna, was about three years old, she had the following conversation with her grandmother:

"Granny, why are your eyes so dim?"
"Because I am old."
"But you will become young again?"
"Oh dear, no. I shall become older and older, and then I shall die."
"And what then?"
"Then I shall be an angel."
"And then you will be a baby again?"

[6] The child found here a welcome opportunity for the provisional solution of a problem. For some time she had been in the habit of asking her mother whether she would ever have a real live doll, a baby brother, which naturally gave rise to the question of where babies come from. As such questions were asked quite spontaneously and unobtrusively, the parents attached no significance to them, but responded to them as lightly as the child herself seemed to ask them. Thus one day she was told the pretty story that children are brought by the stork. Anna had already heard somewhere a slightly more serious version, namely that children are little angels who live in heaven and are then brought down by the said stork. This theory seems to have become the point of departure for the little one's investigating activities. From the conversation with the grandmother it could be seen that this theory was capable of wide application; for it solved in a comforting manner not only the painful thought of dying, but at the same time the riddle of where children come from. Anna seemed to be saying to herself: "When somebody dies he becomes an angel, and then he becomes a child." Solutions of this sort, which kill at least two birds with one stone, used to be tenaciously adhered to even in science, and cannot be undone in the child's mind without a certain amount of shock. In this simple conception there lie the seeds of the reincarnation theory, which, as we know, is still alive today in millions of human beings.[2]

[7] Just as the birth of a little sister was the turning point in the history of "Little Hans," so in this case it was the arrival of a baby brother, which took place when Anna had reached the age of four. The problem of

where children come from, hardly touched upon so far, now became topical. The mother's pregnancy had apparently passed unnoticed; that is to say, Anna had never made any observations on this subject. On the evening before the birth, when labour pains were just beginning, the child found herself in her father's room. He took her on his knee and said, "Tell me, what would you say if you got a little brother tonight?" "I would kill him," was the prompt answer. The expression "kill" looks very alarming, but in reality it is quite harmless, for "kill" and "die" in child language only mean to "get rid of," either actively or passively, as has already been pointed out a number of times by Freud. I once had to treat a fifteen-year-old girl who, under analysis, had a recurrent association, and kept on thinking of Schiller's "Song of the Bell." She had never really read the poem, but had once glanced through it, and could only remember something about a cathedral tower. She could recall no further details. The passage goes:

From the tower
The bell-notes fall
Heavy and sad
For the funeral. …

Alas it is the wife and mother,
Little wife and faithful mother,
Whom the dark prince of the shadows
Snatches from her spouse's arms….

[8] She naturally loved her mother dearly and had no thought of her death, but on the other hand the present position was this: she had to go away with her mother for five weeks, staying with relatives; the year before, the mother had gone by herself, and the daughter (an only and spoilt child) was left at home alone with her father. Unfortunately this year it was the "little wife" who was being snatched from the arms of her spouse, whereas the daughter would greatly have preferred the "faithful mother" to be parted from her child.

[9] On the lips of a child, therefore, "kill" is a perfectly harmless expression, especially when one knows that Anna used it quite

promiscuously for all possible kinds of destruction, removal, demolition, etc. All the same this tendency is worth noting. (Compare the analysis of “Little Hans.”)

[10] The birth occurred in the early morning. When all traces of the birth had been removed, together with the bloodstains, the father went into the room where Anna slept. She awoke as he entered. He told her the news of the arrival of a little brother, which she took with a surprised and tense expression on her face. The father then picked her up and carried her into the bedroom. Anna threw a rapid glance at her rather wan-looking mother and then displayed something like a mixture of embarrassment and suspicion, as if thinking, “What’s going to happen now?” She evinced hardly any pleasure at the sight of the new arrival, so that the cool reception she gave it caused general disappointment. For the rest of the morning she kept very noticeably away from her mother; this was the more striking, as normally she was always hanging around her. But once, when her mother was alone, she ran into the room, flung her arms round her neck and whispered hurriedly, “Aren’t you going to die now?”

[11] Something of the conflict in the child’s soul is now revealed to us. The stork theory had obviously never caught on properly, but the fruitful rebirth hypothesis undoubtedly had, according to which a person helps a child into life by dying. Mama ought therefore to die. Why, then, should Anna feel any pleasure over the new arrival, of whom she was beginning to feel childishly jealous anyway? Hence, she had to assure herself at a favourable opportunity whether Mama was going to die or not. Mama did not die. With this happy issue, however, the rebirth theory received a severe setback. How was it now possible to explain little brother’s birth and the origins of children in general? There still remained the stork theory, which, though never expressly rejected, had been implicitly waived in favour of the rebirth hypothesis.[3] The next attempts at explanation unfortunately remained hidden from the parents, as the child went to stay with her grandmother for a few weeks. From the latter’s report, however, it appears that the stork theory was much discussed, there being of course a tacit agreement to support it.

[12] When Anna returned home she again displayed, on meeting her mother, the same mixture of embarrassment and suspicion as after the birth. The impression was quite explicit to both parents, though not explicable. Her behaviour towards the baby was very nice. Meantime a nurse had arrived, who made a deep impression on little Anna with her uniform—an extremely negative impression at first, as she evinced the greatest hostility towards her in all things. Thus nothing would induce her to let herself be undressed in the evenings and put to bed by this nurse. The reason for this resistance soon became clear in a stormy scene by the bedside of the little brother, when Anna shouted at the nurse, "That's not your little brother, he is mine!" Gradually, however, she became reconciled to the nurse and began to play nurse herself; she had to have her white cap and apron, nursing her little brother and her dolls in turn. In contrast to her former mood the present one was unmistakably elegiac and dreamy. She often sat for hours crouched under the table singing long stories to herself and making rhymes, partly incomprehensible, but consisting partly of wishful fantasies on the "nurse" theme ("I am a nurse of the green cross"), and partly of distinctly painful feelings which were struggling for expression.

[13] Here we meet with an important new feature in the little one's life: reveries, the first stirrings of poetry, moods of an elegiac strain—all of them things which are usually to be met with only at a later phase of life, at a time when the youth or maiden is preparing to sever the family tie, to step forth into life as an independent person, but is still inwardly held back by aching feelings of homesickness for the warmth of the family hearth. At such a time they begin weaving poetic fancies in order to compensate for what is lacking. To approximate the psychology of a four-year-old to that of the boy or girl approaching puberty may at first sight seem paradoxical; the affinity lies, however, not in the age but in the mechanism. The elegiac reveries express the fact that part of the love which formerly belonged, and should belong, to a real object, is now *introverted*, that is, it is turned inwards into the subject and there produces an increased fantasy activity.[4] Whence comes this introversion? Is it a psychological manifestation peculiar to this period, or does it come from a conflict?

[14] On this point the following episode is enlightening. Anna disobeyed her mother more and more often, saying insolently, “I shall go back to Granny!”

“But I shall be sad if you leave me.”

“Ah, but you’ve got baby brother.”

[15] The mother’s reaction shows us what the child was really getting at with her threats to go away again: she obviously wanted to hear what her mother would say to her proposal, what her attitude was in general, and whether the little brother had not ousted her altogether from her mother’s affection. One must not, however, fall for this transparent piece of trickery. The child could see and feel perfectly well that she was not stinted of anything essential in her mother’s love, despite the existence of her baby brother. The veiled reproach she levels at her mother on that score is therefore unjustified, and to the trained ear this is betrayed by the slightly affected tone of voice. One often hears similar tones even with grown-up people. Such a tone, which is quite unmistakable, does not expect to be taken seriously and obtrudes itself all the more forcibly for that reason. Nor should the reproach be taken to heart by the mother, for it is merely the forerunner of other and this time more serious resistances. Not long after the conversation narrated above, the following scene took place:

Mother: “Come, we’ll go into the garden.”

Anna: “You’re lying to me. Watch out if you’re not telling the truth!”

Mother: “What are you thinking of? Of course I’m telling the truth.”

Anna: “No, you are not telling the truth.”

Mother: “You’ll soon see whether I’m telling the truth: we are going into the garden this minute.”

Anna: “Is that true? You’re quite sure it’s true? You’re not lying?”

[16] Scenes of this kind were repeated a number of times. But this time the tone was more vehement and insistent, and also the accent on the word “lie” betrayed something special which the parents did not understand; indeed they attributed far too little significance at first to the child’s spontaneous utterances. In this they were only doing what all official education does. We do not usually listen to children at any stage of their

careers; in all the essentials we treat them as *non compos mentis* and in all the unessentials they are drilled to the perfection of automatons. Behind resistances there always lies a question, a conflict, of which we hear soon enough at another time and on another occasion. But usually we forget to connect the thing heard with the resistances. Thus, on another occasion, Anna faced her mother with the awkward questions:

"I want to be a nurse when I grow up."

"That's what I wanted to be when I was a child."

"Why aren't you a nurse, then?"

"Well, because I am a mother instead, and so I have children of my own to nurse."

Anna (thoughtfully): "Shall I be a different woman from you? Shall I live in a different place? Shall I still talk with you?"

[17] The mother's answer again shows where the child's question was leading.[5] Anna would obviously like to have a child to nurse, just as the nurse has. Where the nurse got the child from is quite clear, and Anna could get a child in the same way when she grew up. Why then wasn't Mama such a nurse—that is, how did she get the child if she didn't get it in the same way as the nurse? Anna could get a child just as the nurse had done, but how all that was going to be different in the future, or rather how she was going to be like her mother in the matter of getting children, was not so easy to see. Hence the thoughtful question "Shall I be a different woman from you?" Shall I be different in every way? The stork theory is evidently no good, the dying theory no less so, therefore one gets a child as the nurse, for example, got hers. In this natural way she, too, could get one; but how about the mother, who is no nurse and yet has children? Looking at the matter from this angle, Anna asks, "Why aren't you a nurse?"—meaning: why haven't you got your child in the plain, straightforward, natural way? This strangely indirect mode of interrogation is typical and may be connected with the child's hazy grasp of the problem, unless we are to assume a certain "diplomatic vagueness" prompted by a desire to evade direct questioning. Later we shall find evidence of this possibility.

[18] Anna is therefore confronted with the question "Where does the child come from?" The stork did not bring it; Mama did not die; nor did

Mama get it in the same way as the nurse. She has, however, asked this question before and was informed by her father that the stork brings children; but this is definitely not so, she has never been deceived on this point. Therefore Papa and Mama and all the others lie. This readily explains her mistrustful attitude at the birth and the reproaches levelled against her mother. But it also explains another point, namely the elegiac reveries which we have attributed to a partial introversion. We now know the real object from which love had to be withdrawn and introverted for lack of an aim: it was withdrawn from the parents who deceived her and refused to tell her the truth. (What can this be which must not be uttered? What goes on here? Such are the parenthetic questions which the child later formulated to herself. Answer: It must be something that needs hushing up, perhaps something dangerous.) Attempts to make the mother talk and to draw out the truth by means of artful questions were futile, so resistance meets with resistance and the introversion of love begins. Naturally the capacity for sublimation in a four-year-old child is still too meagrely developed for it to render more than symptomatic service; hence she has to rely on another compensation, that is, she resorts to one of the already abandoned infantile devices for securing love by force, preferably that of crying and calling the mother at night. This had been diligently practised and exploited during her first year. It now returns and, in keeping with her age, has become well motivated and equipped with recent impressions.

[19] We should mention that the Messina earthquake had just occurred, and this event was much discussed at table. Anna was extraordinarily interested in everything to do with it, getting her grandmother to tell her over and over again how the earth shook and the houses tumbled down and how many people lost their lives. That was the beginning of her nocturnal fears; she could ot be left alone, her mother had to go to her and stay with her, otherwise she was afraid that the earthquake would come and the house fall in and kill her. By day, too, she was intensely occupied with such thoughts; when out walking with her mother she would pester her with such questions as “Will the house be standing when we get home? Will Papa still be alive? Are you sure there’s no earthquake at home?” At every stone in the road she would ask whether

it was from the earthquake. A house under construction was a house destroyed by the earthquake, and so on. Finally she used to cry out at night that the earthquake was coming, she could hear it rumbling. Every evening she had to be solemnly promised that no earthquake would come. Various ways of calming her were tried, for instance she was told that earthquakes only occur where there are volcanoes. But then she had to be satisfied that the mountains surrounding the town were not volcanoes. This reasoning gradually led the child to an intense and, at her age, unnatural craving for knowledge, until finally all the geological pictures and atlases had to be fetched from her father's library. For hours she would rummage through them looking for pictures of volcanoes and earthquakes, and asking endless questions.

[20] We see here an energetic attempt being made to sublimate fear into a desire for knowledge, which strikes us as decidedly premature at this age. But how many gifted children, suffering from exactly the same problem, do we not see being spoon-fed on this untimely sublimation, and by no means to their advantage. For if one fosters sublimation at this age one is only strengthening a neurosis. The root of the child's desire for knowledge is fear, and the fear is the expression of converted libido, that is, of an introversion that has become neurotic and is neither necessary nor favourable to the development of the child at this age. Where this desire for knowledge is ultimately leading is made clear by a series of questions which arose almost daily: “Why is Sophie [a younger sister] younger than I? Where was Freddie [her little brother] before? Was he in heaven and what was he doing there? Why did he only come down now, why not before?”

[21] Such being the state of affairs, the father decided that the mother ought to tell the child the truth about her little brother at the first favourable opportunity.

[22] This presented itself when, soon afterwards, Anna again inquired about the stork. Her mother told her that the story of the stork was not true, but that Freddie grew inside his mother as the flower grows out of the earth. At first he was very little, and then he grew bigger and bigger like a plant. The child listened attentively without the least surprise and then asked:

"But did he come all by himself?"

"Yes."

"But he can't walk yet!"

Sophie: "Then he crawled out."

Anna (overhearing Sophie's remark): "Is there a hole here" —pointing to her chest—"or did he come out of the mouth? Who came out of the nurse?"

[23] At this point she interrupted herself and exclaimed, "No, I know the stork brought him down from heaven!" Then, before the mother could answer her questions, she dropped the subject and again asked to see pictures of volcanoes. The evening following this conversation was calm. The sudden explanation had evidently produced in the child a whole chain of ideas, which announced themselves in a spate of questions. New and unexpected vistas were opened, and she rapidly approached the main problem: "Where did the baby come out? Was it from a hole in the chest or from the mouth?" Both suppositions qualify as acceptable theories. We even meet with young married women who still entertain the theory of the hole in the abdominal wall or of Caesarean section; this is supposed to betray a very unusual degree of innocence. As a matter of fact it is not innocence; in such cases we are practically always dealing with infantile sexual activities which in later life have brought the *vias naturales* into ill repute.

[23a] It may be asked where the child got the absurd idea that there is a hole in the chest, or that the birth takes place through the mouth. Why did she not pick on one of the natural openings in the pelvis, from which things come out daily? The explanation is simple. It was not so very long since our little one had challenged all the educative arts of her mother by her heightened interest in both these openings and their remarkable products—an interest not always in accord with the demands of cleanliness and decorum. Then for the first time she became acquainted with the exceptional laws relating to these bodily regions and, being a sensitive child, she soon noticed that there was something taboo about them. Consequently this region had to be left out of her calculations, a trivial error of thought which may be forgiven in a child when one considers all those people who, despite the most powerful

spectacles, can never see anything sexual anywhere. In this matter Anna reacted far more docilely than her little sister, whose scatological interests and achievements were certainly phenomenal and who even misbehaved in that way at table. She invariably described her excesses as “funny,” but Mama said no, it was not funny, and forbade such fun. The child seemed to take these incomprehensible educational sallies in good part, but she soon had her revenge. Once when a new dish appeared on the table she categorically refused to have anything to do with it, remarking that it was “not funny.” Thereafter all culinary novelties were declined on the ground that they were “not funny.”

[24] The psychology of this negativism is quite typical and is not hard to fathom. The logic of feeling says simply: “If you don’t find my little tricks funny and make me give them up, then I won’t find your tricks funny either, and won’t play with you.” Like all childish compensations of this kind, this works on the important infantile principle “It serves you right when I’m hurt.”

[25] After this digression, let us return to our theme. Anna had merely shown herself docile and had so adjusted herself to the cultural demands that she thought (or at least spoke) of the simplest things last. The incorrect theories that have been substituted for the correct ones sometimes persist for years, until brusque enlightenment comes from without. It is therefore no wonder that such theories, the formation of and adherence to which is favoured even by parents and educationists, should later become determinants of important symptoms in a neurosis, or of delusions in a psychosis, as I have shown in my “Psychology of Dementia Praecox.”[6] Things that have existed in the psyche for years always remain somewhere, even though they may be hidden under compensations of a seemingly different nature.

[26] But even before the question is settled as to where the child actually comes out a new problem obtrudes itself: children come out of Mama, but how about the nurse? Did someone come out of her too? Then follows the abrupt exclamation, “No, I know the stork brought him down from heaven!” What is there so peculiar about the fact that nobody came out of the nurse? We recall that Anna has identified herself with the nurse and plans to become a nurse later, for she too

would like to have a child, and she could get one just as easily as the nurse had done. But now, when it is known that little brother grew in Mama, what is to be done?

[27] This disquieting question is averted by a quick return to the stork-angel theory, which had never really been believed and which after a few trials is definitely abandoned. Two questions, however, remain in the air. The first is: where does the child come out? and the second, a considerably more difficult one: how is it that Mama has children while the nurse and the servants do not? Neither question is asked for the time being.

[28] The next day at lunch, Anna announced, apparently out of the blue, “My brother is in Italy and has a house made of cloth and glass and it doesn’t fall down.”

[29] Here as always it was impossible to ask for an explanation; the resistances were too great, and Anna would not have let herself be pinned down. This unique and rather officious announcement is very significant. For some three months the children had been spinning a stereotyped fantasy of a “big brother” who knew everything, could do everything, and had everything. He had been to all the places where they had not been, was allowed to do all the things they were not allowed to do, was the owner of enormous cows, horses, sheep, dogs, etc.[7] Each of them had such a big brother. The source of this fantasy is not far to seek: its model is the father, who seems to be rather like a brother to Mama. So the children too must have an equally powerful brother. This brother is very brave, he is at present in dangerous Italy and lives in an impossibly fragile house which does not fall down. For the child this is an important wish-fulfilment: the earthquake is no longer dangerous. In consequence the fear and anxiety were banished and did not return. The fear of earthquakes now entirely disappeared. Instead of calling her father to her bedside every evening to conjure away the fear, she now became more affectionate and begged him to kiss her good night. In order to test this new state of affairs, the father showed her more pictures of volcanoes and earthquakes, but Anna remained indifferent and examined the pictures coldly: “Dead people! I’ve seen all that before.” Even the photograph of a volcanic eruption no

longer held any attractions for her. Thus all her scientific interest collapsed and vanished as suddenly as it had come. However, during the days that followed her enlightenment Anna had more important matters to attend to, for she had her newly found knowledge to disseminate among her circle of acquaintances. She began by recounting, at great length, how Freddie had grown in Mama, and herself and her younger sister likewise; how Papa grew in *his* mother and Mama in *her* mother, and the servants in their respective mothers. By dint of numerous questions she also tested whether her knowledge was firmly founded in truth, for her suspicions had been aroused in no small degree, so that repeated corroboration was needed to dissipate all her misgivings. In between times the children brought up the stork-angel theory again, but in a less believing tone, and even lectured the dolls in a singsong voice.

[30] The new knowledge, however, obviously held its ground, for the phobia did not return.

[31] Only once did her certainty threaten to go to pieces. About a week after the enlightenment her father had to spend the morning in bed with an attack of influenza. The children knew nothing of this, and Anna, coming into her parents' bedroom, saw the unexpected sight of her father lying in bed. She made an oddly surprised face, remained standing far away from the bed, and would not come nearer, evidently feeling shy and mistrustful again. Suddenly she burst out with the question "Why are you in bed? Have you got a plant in your inside too?"

[32] Naturally her father had to laugh, and assured her that children never grew in their fathers, that as a matter of fact men did not have children, but only women, whereupon the child instantly became friendly again. But though the surface was calm the problems went on working in the depths. A few days later Anna again announced at lunch, "I had a dream last night about Noah's Ark." The father then asked her what she had dreamed, to which Anna only let out a stream of nonsense. In such cases one must simply wait and pay attention. Sure enough, after a few minutes Anna said to her grandmother, "I had a dream last night about Noah's Ark and there were lots of little animals in it." Another pause. Then she began the story for the third time: *"I had a dream last night*

about Noah's Ark and there were lots of little animals in it and underneath there was a lid which opened and all the little animals fell out." Knowledgeable persons will understand the fantasy. The children really did have a Noah's Ark, but the opening, a lid, was in the roof and not underneath. This is a delicate hint that the story about children being born from the mouth or chest was wrong, and that she had a pretty good idea of where they did come out—namely, from underneath.

[33] Several weeks now passed without any noteworthy occurrences. There was one dream: *"I dreamt about Papa and Mama, they were sitting up late in the study and we children were there too."*

[34] On the face of it this is just the well-known wish of children to be allowed to stay up as long as the parents. This wish is here realized, or rather it is used to mask a much more important wish, the wish to be present in the evenings when the parents are alone, and—naturally and innocently enough—in the *study* where she had seen all those interesting books and had satisfied her thirst for knowledge. In other words, she was really seeking an answer to the burning question of where little brother came from. If the children were there they would find out.

[35] A few days later Anna had a nightmare, from which she awoke screaming, "The earthquake is coming, the house is beginning to shake!" Her mother went to her and comforted her, saying that there was no earthquake, everything was quiet and everybody was asleep. Then Anna said in an urgent tone, "I'd just like to see the spring, how all the little flowers come out and how all the fields are full of flowers; I want to see Freddie, he has such a dear little face. What is Papa doing—what did he say?" Her mother told her he was asleep and hadn't said anything. Anna then remarked, with a sarcastic smile, "He will probably be sick again in the morning!"

[36] This text must be read backwards. The last sentence is not intended seriously, as it was uttered in a sarcastic tone of voice. The last time father was sick Anna suspected him of having "a plant in his inside." The sarcasm therefore means "He will probably have a child in the morning!" But this is not intended seriously, for Papa cannot have a child, only Mama has children; perhaps she will have another tomorrow,

but where from? “What is Papa doing?” Here we have an unmistakable formulation of the difficult problem: what does Papa do if he does not produce children? Anna would very much like to find the clue to all her problems; she would like to know how Freddie came into the world, she would like to see how the flowers come out of the earth in the spring, and these wishes all hide behind her fear of earthquakes.

[37] After this intermezzo Anna slept peacefully until morning. In the morning her mother asked her what was the matter with her last night. Anna had forgotten everything and thought she had only had a dream: *“I dreamt I could make the summer and then someone threw a golliwog down the toilet.”*

[38] This singular dream is made up of two different scenes, which are separated by the word “then.” The second part derives its material from a recent wish to have a golliwog, i.e., to have a masculine doll just as Mama has a little boy. Someone throws the golliwog down the toilet—but usually one lets quite other things drop down the toilet. The inference is that children come out just like the things into the toilet. Here we have an analogy to the *Lumpf*-theory of Little Hans. Whenever several scenes are found in one dream, each scene ordinarily represents a special variation of the working out of the complex. Thus the first part is only a variation of the theme found in the second part. We have noted above what is meant by “seeing the spring” or “seeing the flowers come out.” Anna now dreams that she *can make the summer*, i.e., can cause the flowers to come out; she herself can make a little child, and the second part of the dream represents this as analogous to the making of a motion. Here we put our finger on the egoistic wish which lies behind the seemingly objective interest of the previous night’s conversation.

[39] A few days later the mother received a visit from a lady who was looking forward to her confinement. The children apparently noticed nothing. But the next day they amused themselves, under the guidance of the elder girl, by taking all the old newspapers out of their father’s waste-paper basket and stuffing them under their frocks in front, so that the imitation was unmistakable. That night Anna again had a dream: *“I dreamt about a lady in the town, she had a very fat stomach.”* As the

chief actor in a dream is always the dreamer himself under a definite aspect, the game of the day before finds complete interpretation,

[40] Not long after, Anna surprised her mother with the following performance: she stuck her doll under her clothes and slowly pulled it out head downwards, saying, “Look, the baby is coming out, now it is all out.” Anna was telling her mother: thus I conceive the problem of birth. What do you think of it? is it right? The game is really meant as a question, for, as we shall see later, this conception still had to be officially confirmed.

[41] Rumination on the problem by no means ended here, as is apparent from the ideas Anna conceived during the following weeks. Thus she repeated the same game a few days later with her Teddy bear, which had the function of a specially beloved doll. Another day, pointing to a rose, she said to her grandmother, “Look, the rose is getting a baby.” As the grandmother did not quite take her meaning, the child pointed to the swollen calyx: “Don’t you see, it’s all fat here!”

[42] One day she was quarrelling with her younger sister, when the latter exclaimed angrily, “I’ll kill you!” Whereupon Anna replied, “When I am dead you will be all alone, and then you’ll have to pray to God for a live baby.” And immediately the scene changed: Anna was the angel, and the younger sister had to kneel down before her and beg her to send a living child. In this way Anna became the child-giving mother.

[43] Once they had oranges for supper. Anna impatiently asked for one and said, “I’ll take an orange and I’ll swallow it all down into my stomach, and then I shall get a baby.”

[44] This instantly reminds us of the fairytales in which childless women finally make themselves pregnant by swallowing fruit, fish and the like.[8] Anna was here trying to solve the problem of how children actually get into the mother. In so doing she takes up a position of inquiry which had never been formulated before so precisely. The solution follows in the form of an analogy, which is characteristic of the archaic thinking of the child. (Thinking in analogies is also found in the adult, in the stratum lying immediately below consciousness. Dreams bring the analogies to the surface, as also does dementia praecox.) In German and numerous other foreign fairytales one frequently finds such

childish comparisons. Fairytales seem to be the myths of childhood and they therefore contain among other things the mythology which children weave for themselves concerning sexual processes. The poetry of fairytale, whose magic is felt even by the adult, rests not least upon the fact that some of the old theories are still alive in our unconscious. We experience a strange and mysterious feeling whenever a fragment of our remotest youth stirs into life again, not actually reaching consciousness, but merely shedding a reflection of its emotional intensity on the conscious mind.

[45] The problem of how the child gets into the mother is a difficult one to solve. As the only way of getting things into the body is through the mouth, it stands to reason that the mother ate something like a fruit, which then grew inside her. But here another difficulty presents itself: one knows what comes out of the mother, but what is the use of the father? Now, it is an old rule of the mental economy to connect two unknowns and to use one to solve the other.

[46] Hence the conviction rapidly fastened on the child that the father is somehow involved in the whole business, particularly in view of the fact that the problem of where children come from still leaves the question open of how they get into the mother.

[47] What does the father do? This question occupied Anna to the exclusion of all else. One morning she ran into her parents' bedroom while they were still dressing, jumped into her father's bed, lay flat on her face, and flailed with her legs, crying out, "Look, is that what Papa does?" Her parents laughed and did not answer, as it only dawned on them afterwards what this performance probably signified. The analogy with the horse of Little Hans, which made such a commotion with its legs, is surprisingly close.

[48] Here, with this latest achievement, the matter seemed to rest; at any rate the parents found no opportunity to make any pertinent observations. That the problem should come to a standstill at this point is not really surprising, for this is the most difficult part. The child knows nothing about sperms and nothing about coitus. There is but one possibility: the mother must eat something, for only in that way can anything get into the body. But what does the father do? The frequent

comparisons with the nurse and other unmarried people were obviously to some purpose. Anna was bound to conclude that the existence of the father was in some way significant. But what on earth does he do? Anna and Little Hans are agreed that it must have something to do with the legs.

[49] This standstill lasted about five months, during which time no phobias or any other signs of a working through of the complex appeared. Then came the first premonition of future events. Anna's family were at that time living in a country house near a lake, where the children could bathe with their mother. As Anna was afraid to go more than knee-deep into the water, her father once took her right in with him, which led to a great outburst of crying. That evening, when going to bed, Anna said to her mother, "Papa wanted to drown me, didn't he?"

[50] A few days later there was another outburst. She had continued to stand in the gardener's way until finally, for a joke, he picked her up and put her in a hole he had just dug. Anna started to cry miserably, and declared afterwards that the man had tried to bury her.

[51] The upshot was that Anna woke up one night with fearful screams. Her mother went to her in the adjoining room and quieted her. Anna had dreamed that *"a train went by overhead and fell down."*

[52] Here we have a parallel to the "stage coach" story of Little Hans. These incidents show clearly enough that fear was again in the air, i.e., that there was some obstacle preventing the transference of love to the parents and that therefore a large part of it was converted into fear. This time the mistrust was directed not against the mother, but against the father, who she was sure must know the secret, but would never let anything out. What could the father be doing or keeping up his sleeve? To the child this secret appeared to be something very dangerous, so obviously she felt that the worst might be expected of the father. (This childish fear of the father is to be seen particularly clearly in adults in cases of dementia praecox, which takes the lid off many unconscious processes as though it were acting on psychoanalytical principles.) Hence Anna arrived at the apparently nonsensical notion that her father wanted to drown her.

[53] Meanwhile Anna had grown a little older and her interest in her father took on a special tinge which is rather hard to describe. Language has no words for the peculiar kind of tender curiosity that shone in the child's eyes.

[54] It is probably no accident that the children began playing a pretty game about this time. They called the two biggest dolls their "grandmothers" and played at hospital with them, a tool-shed being taken over as a hospital. There the grandmothers were brought, interned, and left to sit overnight. "Grandmother" in this connection is distinctly reminiscent of the "big brother" earlier. It seems very likely that the "grandmother" deputizes for the mother. So the children were already conspiring to get the mother out of the way.[9] This intention was assisted by the fact that the mother had again given Anna cause for displeasure.

[55] It came about in the following way: The gardener had laid out a large bed which he was sowing with grass. Anna helped him in this work with much pleasure, apparently without guessing the profound significance of her childish play. About a fortnight later she began to observe with delight the young grass sprouting. On one of these occasions she went to her mother and asked, "How did the eyes grow into the head?"

[56] Her mother told her she didn't know. But Anna went on to ask whether God knew, or her father, and why God and her father knew everything? The mother then referred her to her father, who might be able to tell her how the eyes grew into the head. Some days later there was a family gathering at tea. After the meal had broken up, the father remained at the table reading the paper, and Anna also stayed behind. Suddenly approaching her father she said, "Tell me, how did the eyes grow into the head?"

Father: "They did not grow into the head; they were there from the beginning and grew with the head."

Anna: "Weren't the eyes planted?"

Father: "No, they just grew in the head like the nose."

Anna: "But did the mouth and the ears grow like that? And the hair?"

Father: "Yes, they all grew the same way."

Anna: “Even the hair? But the baby mice come into the world all naked. Where was the hair before? Aren’t there little seeds for it?”

Father: “No. The hair, you see, comes out of little granules which are like seeds, but they are already in the skin and nobody sowed them there.”

[57] The father was now getting into a fix. He guessed where the little one was leading him, therefore he did not want to upset, on account of a single false application, the diplomatically introduced seed theory which she had most fortunately picked up from nature; for the child spoke with an unwonted earnestness which compelled consideration.

[58] Anna (visibly disappointed, and in a distressed voice): “But how did Freddie get into Mama? Who stuck him in? And who stuck you into your mama? Where did he come out?”

[59] From this sudden storm of questions the father chose the last for his first answer:

“Think, now, you know that Freddie is a boy; boys grow into men and girls into women, and only women can have children. Now, just think, where could Freddie have come out?”

Anna (laughing joyfully and pointing to her genitals): “Did he come out here?”

Father: “But of course. Surely you must have thought of that before?”

Anna (overlooking the question): “But how did Freddie get into Mama? Did anybody plant him? Was the seed sown?”

[60] This extremely precise question could no longer be evaded by the father. He explained to the child, who listened with the greatest attention, that the mother is like the soil and the father like the gardener; that the father provides the seed which grows in the mother and thus produces a baby. This answer gave her extraordinary satisfaction; she immediately ran to her mother and said, “Papa has told me everything, now I know it all.” But what it was she knew, she never told to anyone.

[61] The new knowledge was, however, put into practice the following day. Anna went up to her mother and said brightly: “Just think, Mama, Papa told me that Freddie was a little angel and was brought down from heaven by the stork.” Her mother was naturally astounded, and said, “I

am quite certain your father never told you anything of the sort.” Whereupon the little one skipped away laughing.

[62] This was her revenge. Her mother evidently would not or could not tell her how the eyes grew into the head; she didn’t even know how Freddie had got into her. Therefore she could easily be led up the garden path with that old story about the stork. She might believe it still.

* * *

[63] The child was now satisfied, for her knowledge had been enriched and a difficult problem solved. An even greater advantage, however, was the fact that she had won a more intimate relationship with her father, which did not prejudice her intellectual independence in the least. The father of course was left with an uneasy feeling, for he was not altogether happy about having passed on to a four-and-a-half-year-old child a secret which other parents carefully guard. He was disquieted by the thought of what Anna might do with her knowledge. What if she was indiscreet and exploited it? She might so easily instruct her playmates or gleefully play the *enfant terrible* with grown-ups. But these fears proved to be groundless. Anna never breathed a word about it, either then or at any time. The enlightenment had, moreover, brought a complete silencing of the problem, so that no more questions presented themselves. Yet the unconscious did not lose sight of the riddle of human creation. A few weeks after her enlightenment Anna recounted the following dream: *She was “in the garden and several gardeners stood making wee-wee against the trees, and Papa was also doing it.”*

[64] This recalls the earlier unsolved problem: what does the father do?

[65] Also about this time a carpenter came into the house in order to repair an ill-fitting cupboard; Anna stood by and watched him planing the wood. That night she dreamt that the carpenter “planed off” her genitals.

[66] The dream could be interpreted to mean that Anna was asking herself: will it work with me? oughtn’t one to do something like what the carpenter did, in order to make it work? Such an hypothesis would indicate that this problem is particularly active in the unconscious at the moment, because there is something not quite clear about it. That this is so was shown by the next incident, which did not, however, occur until

several months later, when Anna was approaching her fifth birthday. Meantime the younger sister, Sophie, was taking a growing interest in these matters. She had been present when Anna received enlightenment at the time of the earthquake phobia, and had even thrown in an apparently understanding remark on that occasion, as the reader may remember. But in actual fact the explanation was not understood by her at the time. This became clear soon afterwards. She had days when she was more than usually affectionate with her mother and never left her skirts; but she could also be really naughty and irritable. On one of these bad days she tried to tip her little brother out of the pram. Her mother scolded her, whereupon she set up a loud wailing. Suddenly, in the midst of her tears, she said, “I don’t know anything about where children come from!” She was then given the same explanation that her elder sister had received earlier. This seemed to allay the problem for her, and for several months there was peace. Then once more there were days when she was whining and bad-tempered. One day, quite out of the blue, she turned to her mother with the question “Was Freddie really in your inside?”

Mother: “Yes.”

Sophie: “Did you push him out?”

Mother: “Yes.”

Anna (butting in): “But was it down below?”

[67] Here Anna employed a childish term which is used for the genitals as well as for the anus.

Sophie: “And then you let him drop down?”

[68] The expression “drop down” comes from that toilet mechanism, of such absorbing interest to children, whereby one lets the excreta drop down into the bowl.

Anna: “Or was he sicked up?”

[69] The evening before, Anna had been sick owing to a slightly upset stomach.

[70] After a pause of several months Sophie had suddenly caught up and now wished to make sure of the explanation previously vouchsafed to her. This making doubly sure seems to indicate that doubts had arisen

concerning the explanation given by her mother. To judge by the content of the questions, the doubts arose because the process of birth had not been adequately explained. "Push" is a word children sometimes use for the act of defecation. It tells us along what lines the theory will develop with Sophie, too. Her further remark, as to whether one had let Freddie "drop down," betrays such a complete identification of her baby brother with excrement that it borders on the ludicrous. To this Anna makes the singular remark that perhaps Freddie was "sicked up." Her own vomiting of the day before had made a deep impression on her. It was the first time she had been sick since her earliest childhood. That was one way in which things could leave the body, though she had obviously not given it serious thought until now. (Only once had it occurred to her, and that was when they were discussing the body openings and she had thought of the mouth.) Her remark is a firm pointer away from the excrement theory. Why did she not point at once to the genitals? Her last dream gives us a clue to the probable reasons: there is something about the genitals which Anna still does not understand; something or other has to be done there to make it "work." Maybe it wasn't the genitals at all; maybe the seed for little children got into the body through the mouth, like food, and the child came out like "sick."

[71] The detailed mechanism of birth, therefore, was still puzzling. Anna was again told by her mother that the child really does come out down below. About a month later, Anna suddenly had the following dream: *"I dreamt I was in the bedroom of Uncle and Auntie. Both of them were in bed. I pulled the bedclothes off Uncle, lay on his stomach, and joggled up and down on it."*

[72] This dream came like a bolt from the blue. The children were then on holiday for several weeks and the father, who had been detained in town on business, had arrived on that same day for a visit. Anna was especially affectionate with him. He asked her jokingly, "Will you travel up to town with me this evening?" Anna: "Yes, and then I can sleep with you?" All this time she hung lovingly on her father's arm as her mother sometimes did. A few moments later she brought out her dream. Some days previously she had been staying as a guest with the aunt mentioned in the dream (the dream, too, was some days old). She had

looked forward particularly to that visit, because she was certain she would meet two small cousins—boys—in whom she showed an unfeigned interest. Unfortunately, the cousins were not there, and Anna was very disappointed. There must have been something in her present situation that was related to the content of the dream for it to be remembered so suddenly. The relation between the manifest content and the conversation with her father is clear enough. The uncle was a decrepit old gentleman and only known to the child from a few rare encounters. In the dream he is patently a substitute for her father. The dream itself creates a substitute for the disappointment of the day before: she is in bed with her father. Here we have the *tertium comparationis* with the present. Hence the sudden remembrance of the dream. The dream recapitulates a game which Anna often played in her father's (empty) bed, the game of joggling about and kicking with her legs on the mattress. From this game stemmed the question "Is this what Papa does?" Her immediate disappointment is that her father answered her question with the words, "You can sleep by yourself in the next room." Then follows the remembrance of the same dream which has already consoled her for a previous erotic disappointment (with the cousins). At the same time the dream is essentially an illustration of the theory that "it" takes place in bed, and by means of the aforementioned rhythmical movements. Whether the remark that she lay on her uncle's stomach had anything to do with her being sick cannot be proved.

[73] Such is the extent of our observations up to the present. Anna is now a little over five years old and already in possession, as we have seen, of a number of the most important sexual facts. Any adverse effect of this knowledge upon her morals and character has yet to be observed. Of the favourable therapeutic effect we have spoken already. It is also quite clear from the report that the younger sister is in need of a special explanation for herself, as and when the problem arises for her. If the time is not ripe, no amount of enlightenment, it would seem, is of the slightest use.

[74] I am no apostle of sex education for schoolchildren, or indeed of any standardized mechanical explanations. I am therefore not in a position to offer any positive and uniformly valid advice. I can only draw one

conclusion from the material here recorded, which is, that we should try to see children as they really are, and not as we would wish them; that, in educating them, we should follow the natural path of development, and eschew dead prescriptions.

Supplement

[75] As already mentioned in the foreword, our views have undergone a considerable change since this paper was first published. There is, in the observations, one point in particular which has not been sufficiently appreciated, namely the fact that again and again, despite the enlightenment they received, the children exhibited a distinct preference for some fantastic explanation. Since the first appearance of the present work this tendency, contrary to my expectations, has increased: the children continue to favour a fantastic theory. In this matter I have before me a number of incontestable observations, some of them concerning the children of other parents. The four-year-old daughter of one of my friends, for instance, who does not hold with useless secrecy in education, was allowed last year to help her mother decorate the Christmas tree. But this year the child told her mother, “It wasn’t right last year. This time I’ll not look and you will lock the door with the key.”

[76] As a result of this and similar observations, I have been left wondering whether the fantastic or mythological explanation preferred by the child might not, for that very reason, be more suitable than a “scientific” one, which, although factually correct, threatens to clamp down the latch on fantasy for good. In the present instance the latch could be unclamped again, but only because the fantasy brushed “science” aside.

[77] Did their enlightenment harm the children? Nothing of the sort was observed. They developed healthily and normally. The problems they broached apparently sank right into the background, presumably as a result of the manifold external interests arising out of school life, and the like. The fantasy activity was not harmed in the least, nor did it pursue paths that could be described as in any way abnormal.

Occasional remarks or observations of a delicate nature were made openly and without secrecy.

[78] I have therefore come to hold the view that the earlier free discussions took the wind out of the children's imagination and thus prevented any secretive fantasy from developing which would have cast a sidelong glance at these things, and would, in consequence, have been nothing but an obstacle to the free development of thinking. The fact that the fantasy activity simply ignored the right explanation seems, in my view, to be an important indication that all freely developing thought has an irresistible need to emancipate itself from the realism of fact and to create a world of its own.

[79] Consequently, however little advisable it is to give children false explanations which would only sow the seeds of mistrust, it is, so it seems to me, no less inadvisable to insist on the acceptance of the right explanation. For the freedom of the mind's development would merely be suppressed through such rigid consistency, and the child forced into a concretism of outlook that would preclude further development. Side by side with the biological, the spiritual, too, has its inviolable rights. It is assuredly no accident that primitive peoples, even in adult life, make the most fantastic assertions about well-known sexual processes, as for instance that coitus has nothing to do with pregnancy.[10] From this it has been concluded that these people do not even know there is such a connection. But more accurate investigation has shown that they know very well that with animals copulation is followed by pregnancy. Only for human beings is it denied—not *not known*, but flatly *denied*—that this is so, for the simple reason that they prefer a mythological explanation which has freed itself from the trammels of concretism. It is not hard to see that in these facts, so frequently observed among primitives, there lie the beginnings of *abstraction*, which is so very important for culture. We have every reason to suppose that this is also true of the psychology of the child. If certain South American Indians really and truly call themselves red cockatoos and expressly repudiate a figurative interpretation of this fact, this has absolutely nothing to do with any sexual repression on "moral" grounds, but is due to the law of independence inherent in the thinking function and to its emancipation

from the concretism of sensuous perceptions. We must assign a separate principle to the thinking function, a principle which coincides with the beginnings of sexuality only in the polyvalent germinal disposition of the very young child. To reduce the origins of thinking to mere sexuality is an undertaking that runs counter to the basic facts of human psychology.

II

INTRODUCTION TO WICKES'S "ANALYSE DER KINDERSEELE"

INTRODUCTION TO WICKES'S "ANALYSE DER KINDERSEELE"[1]

[80] What this book provides is not theory, but experience. That is just what gives it its special value for anyone really interested in child psychology. We cannot fully understand the psychology of the child or that of the adult if we regard it as the subjective concern of the individual alone, for almost more important than this is his relation to others. Here, at all events, we can begin with the most easily accessible and, practically speaking, the most important part of the psychic life of the child. Children are so deeply involved in the psychological attitude of their parents that it is no wonder that most of the nervous disturbances in childhood can be traced back to a disturbed psychic atmosphere in the home. This book shows, from a series of remarkable examples, just how disastrous the parental influence can be for the child. Probably no father or mother will be able to read these chapters without realizing the devastating truths of this book. *Exempla docent*—example is the best teacher! Once more this proves to be a well-worn yet pitiless truth. It is not a question of good and wise counsels, but solely of deeds, of the actual life of the parents. Nor is it a matter of living in accordance with accepted moral values, for the observance of customs and laws can very easily be a cloak for a lie so subtle that our fellow human beings are unable to detect it. It may help us to escape all criticism, we may even be able to deceive ourselves in the belief of our obvious righteousness. But deep down, below the surface of the average man's conscience, he hears a voice whispering, "There is something not right," no matter how much his rightness is supported by public opinion or by the moral code. Certain instances in this book show very clearly that there exists a terrible law which stands beyond man's morality and his ideas of rightness—a law which cannot be cheated.

[81] Besides the problem of environmental influence, the book also gives due weight to psychic factors which have more to do with the irrational values of the child than with his rational psychology. The latter can be made the object of scientific research, while the spiritual values, the

qualities of the soul, elude purely intellectual treatment. It is no good having sceptical ideas about this—nature does not care a pin for our ideas. If we have to deal with the human soul we can only meet it on its own ground, and we are bound to do so whenever we are confronted with the real and crushing problems of life.

[82] I am glad the author has not shrunk from opening the door to intellectual criticism. Genuine experience has nothing to fear from objections, whether justified or unjustified, for it always holds the stronger position.

[83] Although this book does not pretend to be "scientific," it is scientific in a higher sense, because it gives a true picture of the difficulties that actually occur in the upbringing of children. It merits the serious attention of everybody who has anything to do with children, either by vocation or from duty. But it will also be of interest to those who, neither for reasons of duty nor from educational inclination, wish to know more about the beginnings of human consciousness. Even though many of the views and experiences set forth in this book have nothing fundamentally new to offer to the doctor and psychological educator, the curious reader will now and then come upon cases which are strange and will give pause to his critical understanding—cases and facts which the author, with her essentially practical turn of mind, does not pursue in all their complexities and theoretical implications. What is the thoughtful reader to make, for instance, of the puzzling but undeniable fact of the identity of the psychic state of the child with the unconscious of the parents? One is dimly aware here of a region full of incalculable possibilities, a hydra-headed monster of a problem that is as much the concern of the biologist and psychologist as of the philosopher. For anyone acquainted with the psychology of primitives there is an obvious connection between this "identity" and Lévy-Bruhl's idea of "participation mystique." Strange to say, there are not a few ethnologists who still kick against this brilliant idea, for which the unfortunate expression "mystique" may have to shoulder no small part of the blame. The word "mystical" has indeed become the abode of all unclean spirits, although it was not meant like that originally, but has been debased by sordid usage. There is nothing "mystical" about identity, any more than

there is anything mystical about the metabolism common to mother and embryo. Identity derives essentially from the notorious unconsciousness of the small child. Therein lies the connection with the primitive, for the primitive is as unconscious as a child. Unconsciousness means non-differentiation. There is as yet no clearly differentiated ego, only events which may belong to me or to another. It is sufficient that *somebody* should be affected by them. The extraordinary infectiousness of emotional reactions then makes it certain that everybody in the vicinity will involuntarily be affected. The weaker ego-consciousness is, the less it matters who is affected, and the less the individual is able to guard against it. He could only do that if he could say: you are excited or angry, but I am not, for I am not you. The child is in exactly the same position in the family: he is affected to the same degree and in the same way as the whole group.

[84] For all lovers of theory, the essential fact behind all this is that the things which have the most powerful effect upon children do not come from the conscious state of the parents but from their unconscious background. For the ethically minded person who may be a father or mother this presents an almost frightening problem, because the things we can manipulate more or less, namely consciousness and its contents, are seen to be ineffectual in comparison with these uncontrollable effects in the background, no matter how hard we may try. One is afflicted with a feeling of extreme moral uncertainty when one takes these unconscious processes with the seriousness they deserve. How are we to protect our children from ourselves, if conscious will and conscious effort are of no avail? There can be no doubt that it is of the utmost value for parents to view their children's symptoms in the light of their own problems and conflicts. It is their duty as parents to do so. Their responsibility in this respect carries with it the obligation to do everything in their power not to lead a life that could harm the children. Generally far too little stress is laid upon how important the conduct of the parents is for the child, because it is not words that count, but deeds. Parents should always be conscious of the fact that they themselves are the principal cause of neurosis in their children.

[85] We must not, however, exaggerate the importance of unconscious effects, even though the mind’s love of causes finds dangerous satisfaction in doing precisely this. Nor should we exaggerate the importance of causality in general. Certainly causes exist, but the psyche is not a mechanism that reacts of necessity and in a regular way to a specific stimulus. Here as elsewhere in practical psychology we are constantly coming up against the experience that in a family of several children only one of them will react to the unconscious of the parents with a marked degree of identity, while the others show no such reaction. The specific constitution of the individual plays a part here that is practically decisive. For this reason, the biologically trained psychologist seizes upon the fact of organic heredity and is far more inclined to regard the whole mass of genealogical inheritance as the elucidating factor, rather than the psychic causality of the moment. This standpoint, however satisfying it may be by and large, is unfortunately of little relevance to individual cases because it offers no practical clue to psychological treatment. For it also happens to be true that psychic causality exists between parents and children regardless of all the laws of heredity; in fact, the heredity point of view, although undoubtedly justified, diverts the interest of the educator or therapist away from the practical importance of parental influence to some generalized and more or less fatalistic regard for the dead hand of heredity, from the consequences of which there is no escape.

[86] It would be a very grave omission for parents and educators to ignore psychic causality, just as it would be a fatal mistake to attribute all the blame to this factor alone. In every case both factors have a part to play, without the one excluding the other.

[87] What usually has the strongest psychic effect on the child is the life which the parents (and ancestors too, for we are dealing here with the age-old psychological phenomenon of original sin) have not lived. This statement would be rather too perfunctory and superficial if we did not add by way of qualification: that part of their lives which *might have been* lived had not certain somewhat threadbare excuses prevented the parents from doing so. To put it bluntly, it is that part of life which they

have always shirked, probably by means of a pious lie. That sows the most virulent germs.

[88] Our author's exhortation to clear-eyed self-knowledge is therefore altogether appropriate. The nature of the case must then decide how much of the blame really rests with the parents. One should never forget that it is a question of "original sin," a sin against life and not a contravention of man-made morality, and that the parents must therefore be viewed as children of the grandparents. The curse of the House of Atreus is no empty phrase.

[89] Nor should one fall into the error of thinking that the form or intensity of the child's reaction necessarily depends upon the peculiar nature of the parent's problems. Very often these act as a catalyst and produce effects which could be better explained by heredity than by psychic causality.

[90] The causal significance of parental problems for the psyche of the child would be seriously misunderstood if they were always interpreted in an exaggeratedly personal way as moral problems. More often we seem to be dealing with some fate-like ethos beyond the reach of our conscious judgment. Such things as proletarian inclinations in the scions of noble families, outbursts of criminality in the offspring of the respectable or over-virtuous, a paralysing or impassioned laziness in the children of successful business men, are not just bits of life that have been left deliberately unlived, but compensations wrought by fate, functions of a natural ethos which casts down the high and mighty and exalts the humble. Against this neither education nor psychotherapy is of any avail. The most they can do, if reasonably applied, is to encourage the child to fulfil the task imposed upon him by the natural ethos. The guilt of the parents is impersonal, and the child should pay for it no less impersonally.

[91] Parental influence only becomes a moral problem in face of conditions which might have been changed by the parents, but were not, either from gross negligence, slothfulness, neurotic anxiety, or soulless conventionality. In this matter a grave responsibility often rests with the parents. And nature has no use for the plea that one "did not know."

[92] Not knowing acts like guilt.

[93] Frances Wickes's book also raises the following problem in the mind of the thoughtful reader:

> The psychology of "identity," which precedes ego-consciousness, indicates what the child is by virtue of his parents. But what he is as an individuality distinct from his parents can hardly be explained by the causal relationship to the parents. We ought rather to say that it is not so much the parents as their ancestors—the grandparents and great-grandparents—who are the true progenitors, and that these explain the individuality of the children far more than the immediate and, so to speak, accidental parents. In the same way the true psychic individuality of the child is something new in respect of the parents and cannot be derived from their psyche. It is a combination of collective factors which are only potentially present in the parental psyche, and are sometimes wholly invisible. Not only the child's body, but his soul, too, proceeds from his ancestry, in so far as it is individually distinct from the collective psyche of mankind.

[94] The child's psyche, prior to the stage of ego-consciousness, is very far from being empty and devoid of content. Scarcely has speech developed when, in next to no time, consciousness is present; and this, with its momentary contents and its memories, exercises an intensive check upon the previous collective contents. That such contents exist in the child who has not yet attained to ego-consciousness is a well-attested fact. The most important evidence in this respect is the dreams of three- and four-year-old children, among which there are some so strikingly mythological and so fraught with meaning that one would take them at once for the dreams of grown-ups, did one not know who the dreamer was. They are the last vestiges of a dwindling collective psyche which dreamingly reiterates the perennial contents of the human soul. From this phase there spring many childish fears and dim, unchildlike premonitions which, rediscovered in later phases of life, form the basis of the belief in reincarnation. But from this sphere also spring those flashes of insight and lucidity which give rise to the proverb: Children and fools speak the truth.

[95] Because of its universal distribution the collective psyche, which is still so close to the small child, perceives not only the background of the

parents, but, ranging further afield, the depths of good and evil in the human soul. The unconscious psyche of the child is truly limitless in extent and of incalculable age. Behind the longing to be a child again, or behind the anxiety dreams of children, there is, with all due respect to the parents, more than the joys of the cradle or a bad upbringing.

[96] Primitive peoples often hold the belief that the soul of the child is the incarnation of an ancestral spirit, for which reason it is dangerous to punish children, lest the ancestral spirit be provoked. This belief is only a more concrete formulation of the views I have outlined above.

[97] The infinity of the child's preconscious soul may disappear with it, or it may be preserved. The remnants of the child-soul in the adult are his best and worst qualities; at all events they are the mysterious *spiritus rector* of our weightiest deeds and of our individual destinies, whether we are conscious of it or not. It is they which make kings or pawns of the insignificant figures who move about on the checker-board of life, turning some poor devil of a casual father into a ferocious tyrant, or a silly goose of an unwilling mother into a goddess of fate. For behind every individual father there stands the primordial image of the Father, and behind the fleeting personal mother the magical figure of the Magna Mater. These archetypes of the collective psyche, whose power is magnified in immortal works of art and in the fiery tenets of religion, are the dominants that rule the preconscious soul of the child and, when projected upon the human parents, lend them a fascination which often assumes monstrous proportions. From that there arises the false aetiology of neurosis which, in Freud, ossified into a system: the Oedipus complex. And that is also why, in the later life of the neurotic, the images of the parents can be criticized, corrected, and reduced to human dimensions, while yet continuing to work like divine agencies. Did the human father really possess this mysterious power, his sons would soon liquidate him or, even better, would refrain from becoming fathers themselves. For what ethical person could possibly bear so gigantic a responsibility? Far better to leave this sovereign power to the gods, with whom it had always rested before man became "enlightened."

III

CHILD DEVELOPMENT AND EDUCATION

CHILD DEVELOPMENT AND EDUCATION[1]

[98] It is with a certain hesitation that I undertake the task of presenting to you, in a brief lecture, the connection between the findings of analytical psychology and the general problems of education. In the first place, it is a large and extensive field of human experience which cannot possibly be covered in a few pithy sentences. Furthermore, analytical psychology deals with a method and a system of thought neither of which can be assumed to be generally known. Hence their applicability to educational problems is not easily demonstrated. An historical introduction to the way in which this youngest of the psychological sciences has developed is almost indispensable, for it enables us to understand many things which, if we met them today for the first time, would be most difficult to grasp.

[99] Developing out of therapeutic experiences with hypnotism, psychoanalysis, as Freud termed it, became a specific medical technique for investigating the causes of functional, or non-organic, nervous disorders. It was primarily concerned with the sexual origins of these disorders, and its value as a method of therapy was based on the assumption that a permanent curative effect would result from bringing the sexual causes to consciousness. The entire Freudian school still takes this view of psychoanalysis and refuses to recognize any causation of nervous disorders other than the sexual. Although originally subscribing to this method, I have, during the course of years, developed the conception of *analytical psychology*, which lays stress on the fact that psychological investigation along psychoanalytic lines has left the narrow confines of a medical technique, with its restriction to certain theoretical assumptions, and has passed over into the general field of normal psychology. Therefore, when I speak of the connection between analytical psychology and education, I am leaving Freudian analysis out of account. Since the latter is a psychology which deals exclusively with the ramifications of the sexual instinct in the psyche, it would be pertinent to the discussion only if we were dealing exclusively

with the sexual psychology of the child. But at the outset I must make it perfectly clear that I in no way support those views which maintain that the relation of the child to the parents, or to his brothers, sisters, comrades, is to be explained simply as the immature beginnings of the sexual function. Those views, surely not unknown to you, are in my opinion premature and one-sided generalizations which have already given rise to the most absurd misinterpretations. When pathological phenomena are present to a degree which would justify a psychological explanation along sexual lines, it is not the child's own psychology that is fundamentally responsible, but the sexually disturbed psychology of the parents. The mind of the child is extremely susceptible and dependent, and is steeped for a long time in the atmosphere of his parental psychology, only freeing itself from this influence relatively late, if at all.[2]

100] I will now try to give you some idea of the fundamental viewpoints of analytical psychology which are useful in considering the mind of the child, especially at school age. You must not think that I am in a position to offer you a list of hints for immediate application. All I can do is to provide a deeper insight into the general laws which underlie the psychic development of the child. But I shall be content if, from what I am able to give you, you carry away a sense of the mysterious evolution of the highest human faculties. The great responsibility which devolves upon you as educators of the next generation will prevent you from forming hasty conclusions; for there are certain viewpoints which need to germinate, often for a long time, before they can profitably be put into practice. The deepened psychological knowledge of the teacher should not, as unfortunately sometimes happens, be unloaded directly on the child; rather it should help the teacher to adopt an understanding attitude towards the child's psychic life. This knowledge is definitely for adults, not for children. What *they* are given must always be something elementary, and suited to the immature mind.

101] One of the most important achievements of analytical psychology is undoubtedly the recognition of the biological structure of the mind, but it is not easy to put into a few words something that has taken many years to discover. Therefore if at first I seem to range rather far afield, I do so only in order to bring certain general reflections to bear upon the particular problem of the child-mind.

102] Experimental psychology, represented at its best by the school of Wundt, has, as you know, occupied itself exclusively with the psychology of normal consciousness, as though the mind consisted solely of conscious phenomena. But medical psychology, especially the French school, was soon forced to recognize the existence of unconscious psychic phenomena. We know today that the conscious mind consists only of those ideational complexes which are directly associated with the ego. Those psychic factors which possess only a slight degree of intensity, or those which once had intensity but have lost it again, are "under the threshold," that is, they are subliminal, and belong to the sphere of the unconscious. By virtue of its indefinite extension the unconscious might be compared to the sea, while consciousness is like an island rising out of its midst. This comparison, however, must not be pushed too far; for the relation of conscious to unconscious is essentially different from that of an island to the sea. It is not in any sense a stable relationship, but a ceaseless welling-up, a constant shifting of content; for, like the conscious, the unconscious is never at rest, never stagnant. It lives and works in a state of perpetual interaction with the conscious. Conscious contents that have lost their intensity, or their actuality, sink into the unconscious, and this we call forgetting. Conversely, out of the unconscious, there rise up new ideas and tendencies which, as they emerge into consciousness, are known to us as fantasies and impulses. The unconscious is the matrix out of which consciousness grows; for consciousness does not enter the world as a finished product, but is the end-result of small beginnings.

103] This development takes place in the child. During the first years of life there is hardly any consciousness, though the existence of psychic processes manifests itself at a very early stage. These processes, however, are not grouped round an organized ego; they have no centre and therefore no continuity, lacking which a conscious personality is impossible. Consequently the child has in our sense no memory, despite the plasticity and susceptibility of its psychic organ. Only when the child begins to say "I" is there any perceptible continuity of consciousness. But in between there are frequent periods of unconsciousness. One can actually see the conscious mind coming into existence through the gradual unification of fragments. This process continues throughout life, but from puberty onwards it becomes slower, and fewer and fewer fragments of the unconscious are added to consciousness. The greatest and most extensive development takes place during the period between birth and the end of psychic puberty, a period that may normally extend, for a man of our climate and race, to the twenty-fifth year. In the case of a woman it usually ends when she is about nineteen or twenty. This development establishes a firm connection between the ego and the previously unconscious psychic processes, thus separating them from their source in the unconscious. In this way the conscious rises out of the unconscious like an island newly risen from the sea. We reinforce this process in children by education and culture. School is in fact a means of strengthening in a purposeful way the integration of consciousness.

104] Now if we were to ask what would happen if there were no schools, and children were left entirely to themselves, we should have to answer that they would remain largely unconscious. What kind of a state would this be? It would be a primitive state, and when such children came of age they would, despite their native intelligence, still remain primitive—savages, in fact, rather like a tribe of intelligent Negroes or Bushmen. They would not necessarily be stupid, but merely intelligent by instinct. They would be ignorant, and therefore unconscious of themselves and the world. Beginning life on a very much lower cultural level, they would differentiate themselves only slightly from the primitive races. This possibility of regression to the primitive stage is explained by the fundamental biogenetic law which holds good not only for the development of the body, but also in all probability for that of the psyche.

105] According to this law the evolution of the species repeats itself in the embryonic development of the individual. Thus, to a certain degree, man in his embryonic life passes through the anatomical forms of primeval times. If the same law holds for the mental development of mankind, it follows that the child develops out of an originally unconscious, animal condition into consciousness, primitive at first, and then slowly becoming more civilized.

106] The condition during the first two or three years of his life, when the child is unconscious of himself, may be compared to the animal state. Just as the child in embryo is practically nothing but a part of the mother's body, and wholly dependent on her, so in early infancy the psyche is to a large extent part of the maternal psyche, and will soon become part of the paternal psyche as well. The prime psychological condition is one of fusion with the psychology of the parents, an individual psychology being only potentially present. Hence it is that the nervous and psychic disorders of children right up to school age depend very largely on disturbances in the psychic world of the parents. All parental difficulties reflect themselves without fail in the psyche of the child, sometimes with pathological results. The dreams of small children often refer more to the parents than to the child itself. Long ago I observed some very curious dreams in early childhood, for instance the first dreams patients could remember. They were "big dreams," and their content was often so very unchildlike that at first I was convinced they could be explained by the psychology of the parents. There was the case of a boy who dreamt out the whole erotic and religious problem of his father. The father could remember no dreams at all, so for some time I analysed the father through the dreams of his eight-year-old son. Eventually the father began to dream himself, and the dreams of the child stopped. Later on I realized that the peculiar dreams of small children are genuine enough, since they contain archetypes which are the cause of their apparently adult character.[3]

107] A marked change occurs when the child develops consciousness of his ego, a fact which is registered by his referring to himself as "I." This change normally takes place between the third and fifth year, but it may begin earlier. From this moment we can speak of the existence of an individual psyche, though normally the psyche attains relative independence only after puberty. Up till then it has been largely the plaything of instinct and environment. The child who enters school at six is still for the most part the psychic product of his parents, endowed, it is true, with the nucleus of ego-consciousness, but incapable of asserting his unconscious individuality. One is often tempted to interpret children who are peculiar, obstinate, disobedient, or difficult to handle as especially individual or self-willed. This is a mistake. In such cases we should always examine the parental milieu, its psychological conditions and history.[4] Almost without exception we discover in the parents the only valid reasons for the child's difficulties. His disquieting peculiarities are far less the expression of his own inner life than a reflection of disturbing influences in the home. If the physician has to deal with nervous disorders in a child of this age, he will have to pay serious attention to the psychic state of the parents; to their problems, the way they live and do not live, the aspirations they have fulfilled or neglected, and to the predominant family atmosphere and the method of education. All these psychic conditions influence a child profoundly. In his early years the child lives in a state of *participation mystique* with his parents. Time and again it can be seen how he reacts immediately to any important developments in the parental psyche. Needless to say both the parents and the child are unconscious of what is going on. The infectious nature of the parents' complexes can be seen from the effect their mannerisms have on their children. Even when they make completely successful efforts to control themselves, so that no adult could detect the least trace of a complex, the children will get wind of it somehow. I remember a very revealing case of three girls who had a *most* devoted mother. When they were approaching puberty they confessed shamefacedly to each other that for years they had suffered from horrible dreams about her. They dreamt of her as a witch or a dangerous animal, and they could not understand it at all, since their mother was so lovely and so utterly devoted to them. Years later the mother became insane, and in her insanity would exhibit a sort of lycanthropy in which she crawled about on all fours and imitated the grunting of pigs, the barking of dogs, and the growling of bears.

107a] This is an expression of primitive identity, from which the individual consciousness frees itself only gradually. In this battle for freedom the school plays a not unimportant part, as it is the first milieu the child finds outside his home. School comrades take the place of brothers and sisters; the teacher, if a man, acts as a substitute for the father, and, if a woman, for the mother. It is important that the teacher should be conscious of the role he is playing. He must not be satisfied with merely pounding the curriculum into the child; he must also influence him through his personality. This latter function is at least as important as the actual teaching, if not more so in certain cases. Though it is a misfortune for a child to have no parents, it is equally dangerous for him to be too closely bound to his family. An excessively strong attachment to the parents is a severe handicap in his later adaptation to the world, for a growing human being is not destined to remain forever the child of his parents. There are, unfortunately, many parents who keep their children infantile because they themselves do not wish to grow old and give up their parental authority and power. In this way they exercise an extremely bad influence over their children, since they deprive them of every opportunity for individual responsibility. These disastrous methods of upbringing result either in dependent personalities, or in men and women who can achieve their independence only by furtive means. There are other parents, again, who on account of their own weaknesses are not in a position to meet the child with the authority it needs if it is to take its proper place in the world. The teacher, as a personality, is then faced with the delicate task of avoiding repressive authority, while at the same time exercising that just degree of authority which is appropriate to the adult in his dealings with children. This attitude cannot be produced artificially; it can only come about in a natural way when the teacher does his duty as a man and a citizen. He must be an upright and healthy man himself, for good example still remains the best pedagogic method. But it is also true that the very best method avails nothing if its practitioner does not hold his position on his personal merits. It would be different if the only thing that mattered in school life were the methodical teaching of the curriculum. But that is at most only half the meaning of school. The other half is the real psychological education made possible through the personality of the teacher. This education means guiding the child into the larger world and widening the scope of parental training. For however careful the latter is, it can never avoid a certain one-sidedness, as the milieu always remains the same. School, on the other hand, is the first impact of the greater world which the child has to meet, and it ought to help him to free himself progressively from the parental environment. The child naturally brings to the teacher the kind of adaptation he has learned from his father; he projects the father-image upon him, with the added tendency to assimilate the personality of the teacher to the father-image. It is therefore necessary for the teacher to adopt the personal approach, or at any rate to leave the door open for such a contact. If the personal relationship of child to teacher is a good one, it matters very little whether the method of teaching is the most up to date. Success does not depend on the method, any more than it is the exclusive aim of school life to stuff the children's heads with knowledge, but rather to make them real men and women. We need not concern ourselves so much with the amount of specific information a child takes away with him from school; the thing of vital importance is that the school should succeed in freeing the young man from unconscious identity with his family, and should make him properly conscious of himself. Without this consciousness he will never know what he really wants, but will always remain dependent and imitative, with the feeling of being misunderstood and suppressed.

108] In what I have just said I have tried to give you a general picture of the child psyche from the standpoint of analytical psychology; but so far I have remained only on the surface. We can go very much deeper if we apply the methods of investigation used in analytical psychology. The practical application of these would be out of the question for the ordinary teacher, and an amateurish or half-serious use of them is to be severely discouraged, although some knowledge of them on the part of the teacher is certainly desirable. It is by no means desirable, however, that he should apply them directly to the education of the children. It is his own education that needs them, and this will eventually redound to the good of his pupils.

109] You may perhaps be surprised to hear me speak of the education of the educator, but I must tell you that I am far from thinking that a man's education is completed when he leaves school, even if he has achieved the university grade. There should be not only continuation courses for young people, but continuation schools for adults. At present we educate people only up to the point where they can earn a living and marry; then education ceases altogether, as though a complete mental outfit had been acquired. The solution of all the remaining complicated problems of life is left to the discretion—and ignorance—of the individual. Innumerable ill-advised and unhappy marriages, innumerable professional disappointments, are due solely to this lack of adult education. Vast numbers of men and women thus spend their entire lives in complete ignorance of the most important things. Many childish vices are believed to be ineradicable, largely because they are often found in adults whose education is supposed to be finished, and who are therefore thought to be long past the educable period. There was never a greater mistake. The adult *is* educable, and can respond gratefully to the art of individual education; but naturally his education cannot be conducted along the lines suitable to the child. He has lost the extraordinary plasticity of the child's mind, and has acquired a will of his own, personal convictions, and a more or less definite consciousness of himself, so that he is far less amenable to systematic influence. To this must be added the fact that the child, in his psychic development, passes through the ancestral stages and is only educated up to the modern level of culture and consciousness. The adult, however, stands firmly on this level and feels himself to be the upholder of contemporary culture. He therefore has little inclination to submit to a teacher like a child. As a matter of fact, it is important that he should not submit, otherwise he might easily slip back into a childish state of dependence.

110] The educational method, then, that will best meet the needs of the adult must be indirect rather than direct; that is to say, it must put him in possession of such psychological knowledge as will permit him to educate himself. Such an effort could not and should not be expected from a child, but we can expect it from an adult, especially if he is a teacher. The teacher must not be a merely passive upholder of culture; he must actively promote that culture through his own self-education. His culture must never remain at a standstill, otherwise he will start correcting in the children those faults which he has neglected in himself. This is manifestly the antithesis of education.

111] Analytical psychology has given considerable thought to the methods for aiding the adult in his psychic growth, but if I speak to you about them now, it is for the sole purpose of making clear the possibilities of continued self-education. I must warn you again most emphatically that it would be very unsound to apply these methods directly to children. The indispensable basis of self-education is self-knowledge. We gain self-knowledge partly from a critical survey and judgment of our own actions, and partly from the criticism of others. Self-criticism, however, is all too prone to personal prejudice, while criticism from others is liable to err or to be otherwise displeasing to us. At all events, the self-knowledge accruing to us from these two sources is incomplete and confused like all human judgments, which are seldom free from the falsifications of desire and fear. But is there not some objective critique which will tell us what we really are, somewhat after the fashion, say, of a thermometer, which confronts the fever patient with the indisputable fact that he has a temperature of exactly 103.1°? Where our bodies are concerned we do not deny the existence of objective criteria. If, for example, we are convinced that we can eat strawberries, like everybody else, without ill effects, and the body nevertheless reacts with a violent rash, this is objective proof that despite our idea to the contrary we are allergic to strawberries.

112] But when it comes to psychology, it seems to us that everything is voluntary and subject to our choice. This universal prejudice arises from our tendency to identify the whole psyche with the conscious phase of it. There are, however, many extremely important psychic processes which are unconscious, or only indirectly conscious. Of the unconscious we can know nothing directly, but indirectly we can perceive the effects that come into consciousness. If everything in consciousness were, as it seems, subject to our will and choice, then we could not discover anywhere an objective criterion by which to test our self-knowledge. Yet there is something independent of desire and fear, something as impersonal as a product of nature, that enables us to know the truth about ourselves. This objective statement is to be found in a product of psychic activity which is the very last thing we would credit with such a meaning, namely the dream.

113] What are dreams? Dreams are products of unconscious psychic activity occurring during sleep. In this condition the mind is to a large extent withdrawn from our voluntary control. With the small portion of consciousness that remains to us in the dream state we apperceive what is going on, but we are no longer in a position to guide the course of psychic events according to our wish and purpose; hence we are also robbed of the possibility of deceiving ourselves. The dream is a spontaneous process resulting from the independent activity of the unconscious, and is as far removed from our conscious control as, shall we say, the physiological activity of digestion. Therefore, we have in it an absolutely objective process from the nature of which we can draw objective conclusions about the situation as it really is.

114] That is all very well, you will say, but how in the world is it possible to draw trustworthy conclusions from the fortuitous and chaotic confusion of a dream? To this I hasten to reply that dreams are only apparently fortuitous and chaotic. On closer inspection we discover a remarkable sequence in the dream-images, both in relation to one another and in relation to the content of waking consciousness. This discovery was made by means of a relatively simple procedure, which works as follows: The body of the dream is divided into its separate portions or images, and all the free associations to each portion are collected. In doing this, we soon become aware of an extremely intimate connection between the dream-images and the things that occupy our thoughts in the waking state, although the meaning of this connection may not be immediately apparent. By collecting all the associations we complete the preliminary part of the dream analysis, thus establishing the context, which shows the manifold connections of the dream with the contents of consciousness and the intimate way in which it is bound up with the tendencies of the personality.

115] When we have illuminated the dream from all sides we can begin the second part of our task, namely the interpretation of the material before us. Here as everywhere in science, we must rid ourselves of prejudice as far as possible, and let the material speak for itself. In very many cases a single glance at the dream and the assembled material suffices to give us at least an intuition of its meaning, and no special effort of thought is needed to interpret it. In other cases it requires much labour and considerable experience. Unfortunately I cannot enter here into the far-reaching question of dream-symbolism. Massive tomes have been written on this subject, and although in practice we cannot do without the experience stored up in these volumes, there are many cases where sound common sense is enough.

116] By way of illustration I shall now give you a short dream, together with its meaning.

117] The dreamer was a man with an academic education, about fifty years of age. I knew him only slightly, and our occasional meetings consisted mostly of humorous gibes on his part at what we called the “game” of dream interpretation. On one of these occasions he asked me laughingly if I was still at it. I replied that he obviously had a very mistaken idea of the nature of dreams. He then remarked that he had just had a dream which I must interpret for him. I said I would do so, and he told me the following dream:

> *He was alone in the mountains, and wanted to climb a very high, steep mountain which he could see towering in front of him. At first the ascent was laborious, but then it seemed to him that the higher he climbed the more he felt himself being drawn towards the summit. Faster and faster he climbed, and gradually a sort of ecstasy came over him. He felt he was actually soaring up on wings, and when he reached the top he seemed to weigh nothing at all, and stepped lightly off into empty space*. Here he awoke.

118] He wanted to know what I thought of his dream. I knew that he was not only an experienced but an ardent mountain-climber, so I was not surprised to see yet another vindication of the rule that dreams speak the same language as the dreamer. Knowing that mountaineering was such a passion with him, I got him to talk about it. He seized on this eagerly and told me how he loved to go alone without a guide, because the very danger of it had a tremendous fascination for him. He also told me about several dangerous tours, and the daring he displayed made a particular impression on me. I asked myself what it could be that impelled him to seek out such dangerous situations, apparently with an almost morbid enjoyment. Evidently a similar thought occurred to him, for he added, becoming at the same time more serious, that he had no fear of danger, since he thought that death in the mountains would be something very beautiful. This remark threw a significant light on the dream. Obviously he was looking for danger, possibly with the unavowed idea of suicide. But why should he deliberately seek death? There must be some special reason. I therefore threw in the remark that a man in his position ought not to expose himself to such risks. To which he replied very emphatically that he would never "give up his mountains," that he had to go to them in order to get away from the city and his family. "This sticking at home does not suit me," he said. Here was a clue to the deeper reason for his passion. I gathered that his marriage was a failure, and that there was nothing to keep him at home. Also he seemed disgusted with his professional work. It occurred to me that his uncanny passion for the mountains must be an avenue of escape from an existence that had become intolerable to him.

119] I therefore privately interpreted the dream as follows: Since he still clung on to life in spite of himself, the ascent of the mountain was at first laborious. But the more he surrendered himself to his passion, the more it lured him on and lent wings to his feet. Finally it lured him completely out of himself: he lost all sense of bodily weight and climbed even higher than the mountain, out into empty space. Obviously this meant death in the mountains.

120] After a pause, he said suddenly, "Well, we've talked about all sorts of other things. You were going to interpret my dream. What do you think about it?" I told him quite frankly what I thought, namely that he was seeking his death in the mountains, and that with such an attitude he stood a remarkably good chance of finding it.

121] "But that is absurd," he replied, laughing. "On the contrary, I am seeking my health in the mountains."

122] Vainly I tried to make him see the gravity of the situation. Six months later, on the descent from a very dangerous peak, he literally stepped off into space. He fell on the head of a companion who was standing on a ledge below him, and both were killed.[5]

123] From this dream we can observe the general function of dreams. It reflects certain vital tendencies of the personality, either those whose meaning embraces our whole life, or those which are momentarily of most importance. The dream presents an objective statement of these tendencies, a statement unconcerned with our conscious wishes and beliefs. After this you will probably agree with me that a dream may in certain circumstances be of inestimable value for conscious life, even when it is not, as here, a matter of life and death.

124] How much of moral and practical value this dreamer would have gained if only he had known of his dangerous lack of restraint!

125] That is why, as physicians of the soul, we have to turn to the ancient art of dream interpretation. We have to educate adults who are no longer willing, like children, to be guided by authority. We have to do with men and women whose way of life is so individual that no counsellor, however wise, could prescribe the way that is uniquely right for them. Therefore we have to teach them to listen to their own natures, so that they can understand from within themselves what is happening.

126] So far as is possible within the limits of a lecture, I have tried to give you some insight into the world of analytical psychology and its ideas. I for my part shall be satisfied if what I have said is of help to you in your profession.

IV

ANALYTICAL PSYCHOLOGY AND EDUCATION

[The following three lectures were delivered at the International Congress of Education, in London in 1924. They were originally drafted in English by the author and revised by Roberts Aldrich. They were then published in German as *Analytische Psychologie und Erziehung* (Heidelberg, 1926), and the English version was subsequently published in *Contributions to Analytical Psychology* (London and New York, 1928) together with the preceding lecture. The present new translation is made from the revised and enlarged edition of *Psychologie und Erziehung* (Zurich, 1946), on the basis of careful comparison between it and the earlier English version.—EDITORS.]

LECTURE ONE

127] Psychology is one of the youngest sciences. The word “psychology” has been in use for a long time, but formerly it was only the title of a certain chapter in philosophy—that chapter in which the philosopher more or less laid down the law as to what the human soul had to be according to the premises of his own particular philosophy. I remember, as a young student, that I used to enjoy the privilege of hearing from one professor how little was known about the real nature of psychic processes, and from another exactly what the psyche had to be as a logical necessity. If one studies the origins of modern empirical psychology one is profoundly impressed by the fight which the earliest investigators had to wage against the firmly entrenched scholastic way of thinking. Philosophic thought, powerfully influenced by theology (“queen of sciences”), had a decidedly deductive tendency, and over it there reigned a mass of naïve, idealistic preconceptions which were bound sooner or later to lead to a reaction. This reaction took the form of the materialism of the nineteenth century, from whose outlook we are not yet completely freed even today. The success of the empirical method is so undeniable that the splendour of its victory has even begotten a materialistic philosophy, which in reality is more a psychological reaction than a justifiable scientific theory. The materialistic outlook is an exaggerated reaction against the medieval idealism and has nothing to do with the empirical method as such.

128] Thus modern empirical psychology was cradled in an atmosphere of rank materialism. It was first and foremost a physiological psychology, thoroughly empirical in its experimental basis, viewing the psychic process exclusively from outside and mainly with an eye to its physiological manifestations. Such a state of affairs was fairly satisfactory so long as psychology was a department of philosophy or of the natural sciences. So long as it was restricted to the laboratory, psychology could remain purely experimental and could regard the psychic process entirely from outside. Instead of the old dogmatic psychology we now had a philosophical psychology no less academic in its origins. However, the peace of the academic laboratory was soon to be disturbed by the demands of those who needed psychology for practical purposes. These intruders were the doctors. The neurologist as well as the psychiatrist has to concern himself with psychic disorders and therefore feels the urgent need of a psychology that can be practically applied. Quite independently of the developments of academic psychology medical men had already discovered a means of access to the human mind and to the psychological treatment of its disorders. This was hypnotism, which grew out of what had been called "mesmerism" in the latter part of the eighteenth century, and "animal magnetism" at the beginning of the nineteenth. The development of hypnotism led, via Charcot, Liébeault, and Bernheim, to the kind of medical psychology represented by Pierre Janet. Another of Charcot's pupils, Freud, in Vienna,[1] used the hypnotic method at first very much in the same way as Janet, but he soon struck out on a different path. Whereas Janet remained for the most part descriptive, Freud penetrated further and more deeply into matters which, to the medical science of those days, hardly seemed worth investigating, namely the morbid fantasies of the patient and their activity in the realm of the unconscious mind. It would be unjust to imply that Janet overlooked this; indeed the contrary is the case. It is his great merit to have pointed out the existence and the importance of unconscious processes in the psychological structure of nervous and mental disorders. Freud's particular merit lies not in the actual discovery of unconscious activity, but in unveiling the real nature of this activity, and above all in working out a practical method for exploring the unconscious. Independently of Freud, I too had approached the problem of a practical psychology firstly from the side of experimental psychopathology, employing chiefly the association method, and then from the study of the personality.[2] As Freud made the hitherto neglected morbid fantasies of the patient his special field of research,[3] so I directed my attention more particularly to the reasons why people made certain mistakes in the course of the association experiment. Like the fantasies of hysterics, the disturbances in the association experiment were regarded as valueless and meaningless, a purely fortuitous phenomenon, in a word, as so much *materia vilis*. I discovered,[4] however, that these disturbances were due to the operation of unconscious processes which I called "feeling-toned complexes."[5] After having, so to speak, put my finger on the same psychological mechanisms as Freud, it was natural that I should become his pupil and collaborator over a period of many years. But while I always recognized the truth of his conclusions so far as the facts were concerned, I could not conceal my doubts as to the validity of his theories. His regrettable dogmatism was the main reason why I felt obliged to part company from him. My scientific conscience would not allow me to lend support to an almost fanatical dogma based on a one-sided interpretation of the facts.

129] Freud's achievement is by no means inconsiderable. But while he shares with others the discovery of the unconscious in relation to the aetiology and structure of neuroses and psychoses, his great and unique merit, to my mind, lies in his discovery of a method for exploring the unconscious and, more particularly, dreams. He was the first to make the bold attempt to throw open the secret doors of the dream. The discovery that dreams have a meaning, and that there is a way to an understanding of them, is perhaps the most significant and most valuable part of this remarkable edifice called psychoanalysis. I do not wish to belittle Freud's achievement, but I feel I must be fair to all those who have wrestled with the great problems of medical psychology and who, through their labours, have laid the foundations without which neither Freud nor myself would have been able to accomplish our tasks. Thus Pierre Janet, Auguste Forel, Théodore Flournoy, Morton Prince, Eugen Bleuler, deserve gratitude and remembrance whenever we speak of the first steps of medical psychology.

130] Freud's work has shown that the functional neuroses are causally based on unconscious contents whose nature, when understood, allows us to see how the disease came about. The value of this discovery is as great as the discovery of the specific cause of tuberculosis and other infectious diseases. Moreover, quite apart from the therapeutic importance of analytical psychology, the psychology of the normal has been tremendously enriched, for the understanding of dreams has opened up an almost limitless vista, showing how consciousness develops out of the remotest and darkest depths of the unconscious, while the practical application of the analytical method has enabled us to distinguish typical functions and attitudes in the behaviour of normal individuals. In so far as psychoanalysis is a branch of medical psychology, it concerns itself solely with abnormal cases and should therefore be reserved for the physician; but dream psychology, studied for the light it throws upon normal human behaviour, will be of ever-increasing interest to thoughtful people generally, and especially to those with educational inclinations. It is in fact highly desirable that the educator, if he wishes really to understand the mentality of his pupils, should pay attention to the findings of analytical psychology. That, however, presupposes some knowledge of psychopathology, for the abnormal child is far harder to understand than the normal. Abnormality and disease are not far apart, and just as one expects some knowledge of the physical ailments of children from the all-round educated teacher, so one might expect from him a little knowledge of their psychic ailments.

131] There are five main groups of psychic disturbances in children:

BACKWARD CHILDREN. A common form of backward child is the mental defective, characterized chiefly by low intelligence and a general incapacity to understand.

132] The most obvious type is the phlegmatic, slow, dull-witted, stupid child. Among these cases may be found children who, for all their poverty of intellect, are distinguished by a certain richness of heart, and who are capable of loyalty, affection, devotion, reliability, and self-sacrifice. The less obvious and rarer type is the excitable, easily irritated child, whose mental incapacity is no less indubitable than that of the defective, but is often markedly one-sided.

133] From these congenital and practically incurable, though not ineducable, types we must distinguish the child with arrested mental development. His development is very slow, at times almost imperceptible, and it often needs the expert diagnosis of a skilled psychiatrist to decide whether it is a case of mental defect or not. Such children frequently have the emotional reactions of imbeciles. I was once consulted about a boy of six years old who suffered from violent fits of rage, during which he used to smash his toys and threaten his parents and his nurse in quite a dangerous way. In addition he “refused to speak,” as his parents put it. He was a little fellow, well-fed, but terribly suspicious, malevolent, obstinate, and altogether negative. It was perfectly obvious that he was an imbecile and simply *could* not speak. He had never learnt how to do so. But his imbecility was not bad enough to account entirely for his inability to speak. His general behaviour pointed to a neurosis. Whenever a young child exhibits the symptoms of a neurosis one should not waste too much time examining his unconscious. One should begin one’s investigations elsewhere, starting with the mother; for almost invariably the parents are either the direct cause of the child’s neurosis or at least the most important element in it. Thus I found that the child was the only boy among seven girls. The mother was an ambitious, self-willed woman, who took it as an insult when I told her that her son was not normal. She had deliberately repressed all knowledge of the boy’s infirmity; he simply *had* to be intelligent, and if he was stupid, it was all due to his evil will and malicious obstinacy. Naturally the boy learnt far less than he would have done had he been lucky enough to possess a reasonable mother; in fact he learnt nothing at all. What is more, he duly became the very things his mother’s own ambition drove him to, namely, malicious and self-willed. Totally misunderstood, and therefore isolated within himself, he developed his fits of rage out of sheer despair. I know of another boy, of fourteen, in much the same family circumstances. He killed his stepfather with an axe during a paroxysm of rage. He too had been pushed too far.

134] Arrested mental development is found not infrequently in first children, or in children whose parents are estranged through psychic incompatibilities. It may also result from the mother’s illness during pregnancy, or from prolonged labour, or from deformation of the skull and hemorrhage during delivery. If such children are not ruined by educational forcing, they normally attain a relative mental maturity in the course of time, though it may be later than with ordinary children.

135] The second group comprises PSYCHOPATHIC CHILDREN. In cases of moral insanity the disorder is either congenital or due to organic injury of parts of the brain by wounding or disease. Such cases are incurable. Occasionally they become criminals and they have in them the seeds of habitual criminality.

136] From this group one must carefully distinguish the child with arrested moral development, the morbidly autoerotic type. These cases often display an alarming amount of egotism and premature sexual activity; in addition they are untruthful and unreliable, and almost completely lacking in human feeling and love. As a rule they are illegitimate or adopted children who have unfortunately never been warmed and nourished by the psychic atmosphere of a real father and mother. They suffer from an almost organic lack of something that every child needs as a vital necessity, namely the psychically nourishing care of parents, and especially of a mother. As a result, illegitimate children in particular are always exposed to psychic danger, and it is the moral sphere that suffers first and foremost. Many children can adapt to foster parents, but not all; and those who cannot, develop an extremely self-centred and ruthlessly egotistical attitude for the unconscious purpose of getting for themselves what the real parents have failed to give them. Such cases are not always incurable. I once saw a boy who violated his four-year-old sister when he was five, tried to kill his father when he was nine, but at the age of eighteen was developing into satisfactory normality, despite a diagnosis of incurable moral insanity. If the unbridled licentiousness to which such cases are sometimes prone is coupled with a good intelligence, and if there is no irreparable break with society, these patients can give up their criminal tendencies by using their heads. Nevertheless, it is to be observed that reason is a very flimsy barrier against pathological proclivities.

137] The third group consists of EPILEPTIC CHILDREN. These cases are unfortunately not uncommon. It is easy enough to recognize a true epileptic attack, but what is called “petit mal” is an exceedingly obscure and complicated condition. Here there are no obvious attacks, only very peculiar and often hardly perceptible alterations of consciousness, which nevertheless pass over into the severe mental disorder of the epileptic with his irritability ferocity, greediness, his sticky sentimentality, his morbid passion for justice, his egotism, and his narrow range of interests. It is of course impossible to enumerate here all the manifold forms of epilepsy; but, in order to illustrate its symptomatology, I will mention the case of a small boy who began to behave strangely when he was about seven years old. The first thing to be noticed was that he used to disappear abruptly, and was then found hiding in the cellar or in a dark corner of the attic. It was impossible to get him to explain why he ran away so suddenly and hid himself. Sometimes he would leave off playing and bury his face in his mother's skirts. At first these things happened so rarely that no attention was paid to his odd behaviour, but when he began to do the same thing at school, suddenly leaving his desk and running to the teacher, his family became alarmed. Nobody, however, had thought of the possibility of a serious disease. Occasionally, too, he would stop short for a few seconds in the middle of a game, or even in the middle of a sentence, without any explanation and apparently without even knowing that the lapse had occurred. Gradually he developed a rather disagreeable and irritable character. Sometimes he had fits of rage, and on one occasion he threw a pair of scissors at his little sister with such force that the point pierced the bone of the skull just above the eyes, nearly killing her. As the parents did not think of consulting a psychiatrist, the disease remained unrecognized, and he was treated simply as a bad boy. At the age of twelve he had his first observed epileptic fit, and only then was his disease understood. Despite great difficulties I was able to find out from the boy that when he was about six he began to be seized with terror of some unknown being. When he was alone, he had the feeling that someone unseen was present. Later he came to see a short man with a beard, a man he had never seen before, but whose features he could describe in great detail. This man suddenly appeared before him and frightened him so much that he ran away and hid himself. It was difficult to discover why the man was so terrifying. The boy was obviously upset about something, which he treated as a dreadful secret. It took me hours to win his confidence, but eventually he confessed. "This man tried to make me take something terrible from him. I can't tell you what it was, it was frightful. He came nearer and nearer and kept on insisting that I must take it, but I was so frightened that I always ran away and did not take it." As he said this he turned pale and began to tremble with fear. When at last I succeeded in calming him down, he said, “This man tried to make me take a *sin.*” “But what sort of a sin?” I asked. The boy stood up, looked suspiciously all round him, and then whispered, “It was murder.” When he was eight years old he had, as I mentioned above, made a violent attack on his sister. Later, the attacks of fear continued, but the vision changed. The terrible man did not return; but in his stead there appeared the figure of a nun, a sort of nurse. At first her face was veiled, but later it was unveiled, revealing a most terrifying expression, a pale, deathlike face. Between the ages of nine and twelve he was haunted by this figure. The fits of rage, despite his growing irritability, ceased, but the manifest epileptic attacks began to appear instead. Clearly, the vision of the nun signified the changing of the incompatible criminal tendency symbolized by the bearded man into obvious disease.[6]

138] Sometimes such cases are still mainly functional and not yet organic, so that it is possible to do something for them with psychotherapy. That is why I have mentioned this case in some detail. It may give some idea of what goes on in the child’s mind behind the scenes.

139] The fourth group comprises the various forms of PSYCHOSIS. Although such cases are not common among children, one can find at least the first stages of that pathological mental development which later, after puberty, leads to schizophrenia in all its manifold forms. As a rule these children behave in a strange and even bizarre way; they are incomprehensible, often quite un-get-at-able, hypersensitive, shut in, emotionally abnormal, being either torpid or liable to explode over the most trifling causes.

140] I once had to examine a boy of fourteen in whom sexual activity had begun suddenly and somewhat prematurely in a rather disquieting way, so that it disturbed his sleep and upset his general health. The trouble began when the boy went to a dance and a certain girl refused to dance with him. He went away in high dudgeon. When he got home he tried to learn his school lessons, but found it was impossible because of a mounting and indescribable emotion compounded of fear, rage, and despair, which took hold of him more and more until at last he rushed out into the garden and rolled on the ground in an almost unconscious condition. After a couple of hours the emotion passed and the sexual trouble began. There were several cases of schizophrenia in this boy's family. This is a typical pathological emotion characteristic of children with a bad family inheritance.

141] The fifth group consists of NEUROTIC CHILDREN. It is of course quite beyond the scope of a single lecture to describe all the symptoms and forms of a childhood neurosis. Anything may be found, ranging from abnormally naughty behaviour to definitely hysterical attacks and states. The trouble can be apparently physical, for instance hysterical fever or abnormally low temperature, convulsions, paralysis, pain, digestive disturbances, etc., or it can be mental and moral, taking the form of excitement or depression, lying, sexual perversion, stealing, and so forth. I remember the case of a little girl of four who had suffered from the most chronic constipation since the first year of her life. She had already undergone every imaginable and unimaginable kind of physical treatment. All were useless, because the doctors overlooked the one important factor in the child's life, namely her mother. As soon as I saw the mother I realized that she was the real cause, and so I suggested treating her and advised her at the same time to give up the child. Another person took the mother's place, and the next day the trouble was gone, and did not return, as I was able to follow up the case for many years afterward. The solution of this problem was quite simple as regards the child, though of course it would not have been so had not the pathogenic influence coming from the mother been removed through analysis. The little girl was a youngest child, the regular pet of a neurotic mother. The latter projected all her phobias onto the child and surrounded her with so much anxious care that she was never free from tension, and such a state is notoriously unfavourable to the peristaltic function.

142] It is my conviction that it is absolutely essential for any teacher who wishes to apply the principles of analytical psychology to have a first-hand knowledge of the psychopathology of childhood and its attendant dangers. Unfortunately, there are certain books on psychoanalysis which give the impression that it is all very simple and that success can be had for the asking. No competent psychiatrist could endorse such superficial notions, and no warning can be too emphatic against unskilled and frivolous attempts to analyse children. There is no doubt that it is of the greatest value to the educator to know what modern psychology has contributed to the understanding of the child mind. But anyone who wishes to apply analytical methods to children must have thorough knowledge of the pathological conditions he will be called upon to deal with. I must confess that I do not see how anyone, except a responsible physician, can dare to analyse children without special knowledge and medical advice.

143] To analyse children is a most difficult and delicate task. The conditions under which we have to work are altogether different from those governing the analysis of grown-ups. The child has a special psychology. Just as its body during the embryonic period is part of the mother's body, so its mind is for many years part of the parents' mental atmosphere. That explains why so many neuroses of children are more symptoms of the mental condition of the parents than a genuine illness of the child. Only a very little of the child's psychic life is its own; for the most part it is still dependent on that of the parents. Such dependence is normal, and to disturb it is injurious to the natural growth of the child's mind. It is therefore understandable that premature and indelicate enlightenment on the facts of sex can have a disastrous effect on his relations with his parents, and such an effect is almost inevitable if you base your analysis on the dogma that the relations between parents and children are necessarily sexual.

144] It is no less unjustifiable to give the so-called Oedipus complex the status of a prime cause. The Oedipus complex is a symptom. Just as any strong attachment to a person or a thing may be described as a "marriage," and just as the primitive mind can express almost anything by using a sexual metaphor, so the regressive tendency of a child may be described in sexual terms as an "incestuous longing for the mother." But it is no more than a figurative way of speaking. The word "incest" has a definite meaning, and designates a definite thing, and as a general rule can only be applied to an adult who is psychologically incapable of linking his sexuality to its proper object. To apply the same term to the difficulties in the development of a child's consciousness is highly misleading.

145] This is not to say that sexual precocity does not exist. But such cases are distinctly exceptional and abnormal, and there is nothing to justify the doctor in extending the concepts of pathology to the sphere of the normal. Just as it is hardly permissible to call blushing a skin disease, or joy a fit of madness, so cruelty is not necessarily sadism, pleasure is not necessarily lust, and firmness is not necessarily sexual repression.

146] In studying the history of the human mind one is impressed again and again by the fact that its growth keeps pace with a widening range of consciousness, and that each step forward is an extremely painful and laborious achievement. One could almost say that nothing is more hateful to man than to give up the smallest particle of unconsciousness. He has a profound fear of the unknown. Ask anybody who has ever tried to introduce new ideas! If even the allegedly mature man is afraid of the unknown, why shouldn't the child hesitate also? The *horror novi* is one of the most striking qualities of primitive man. This is a natural enough obstacle, as obstacles go; but excessive attachment to the parents is unnatural and pathological, because a too great fear of the unknown is itself pathological. Hence one should avoid the one-sided conclusion that hesitation in advancing is necessarily due to sexual dependence on the parents. Often it may be simply a *reculer pour mieux sauter*. Even in cases where children do exhibit sexual symptoms—where, in other words, the incestuous tendency is perfectly obvious—I should recommend a careful examination of the parents' psyche. One finds astonishing things, such as a father unconsciously in love with his own daughter, a mother who is unconsciously flirting with her son, imputing under the cover of unconsciousness their own adult emotions to their children, who, again unconsciously, act the parts allotted to them. Children will not of course play these strange and unnatural roles unless unconsciously forced into them by their parents' attitude.

147] I will now describe one such case. There was a family of four children, two daughters and two sons. All four were neurotic. The girls had shown neurotic symptoms since before puberty. I shall avoid unnecessary details, sketching the fate of the family only in broad outline.

148] The elder daughter, when she was twenty, fell in love with an eminently suitable young man of good family and a university education. The marriage, however, was put off for one reason or another, and, as though hypnotized, she started an affair with one of her father's office employees. She seemed to love her fiancé very much, but was so prudish with him that she never allowed him even to kiss her, while she went very far with the other man without the slightest hesitation. She was excessively naïve and childish, and totally unconscious at first of what she was doing. Then, to her unspeakable horror, the full consciousness of it came over her. She broke down completely, and for years she suffered from hysteria. She severed her connection with the employee and also with her fiancé without explaining her conduct to anyone.

149] The second daughter got married, apparently with no difficulties, but to a man below her mental level. She was frigid and remained childless. In less than a year she had fallen so passionately in love with a friend of her husband's that it developed into a long-drawn-out love affair.

150] The elder son, in himself a talented young man, showed the first signs of neurotic indecision when it came to choosing a career. Eventually he decided to study chemistry, but he had no sooner begun than he was overwhelmed with such a homesickness that he left the university and went straight home to mother. There he fell into a peculiar state of mental confusion with hallucinations, and when this state subsided again after about six weeks, he resolved to take up medicine. He actually went so far as to sit for the examination. Soon afterwards he became engaged. Hardly was the engagement a fact than he began to doubt the rightness of his choice; then came anxiety states and the engagement was broken off. Thereupon he went right off his head and had to be shut up in an asylum for several months.

151] The second son was a psychasthenic neurotic, a woman-hater who seriously planned to remain a bachelor all his life and clung to his mother in the most sentimental way.

152] I was called in to deal with all four children. In each case the history pointed back unmistakably to the mother's secret. Eventually I learned her story. She was a talented, vivacious woman, who in her young days had received a strict, very one-sided and narrow education. With the utmost severity towards herself and with remarkable strength of character she had adhered all her life to the principles implanted in her, and allowed herself no exceptions. She had not long been married when she got to know a friend of her husband's, and fell obviously in love with him. It was equally obvious to her that this love was fully reciprocated. But her principles made no provision for such an eventuality, therefore it had no right to exist. She always behaved as if nothing were amiss, and she kept up the part for over twenty years until the death of this man, with never a word spoken on either side. Her relations with her husband were distant and correct. In later years she suffered from periodic melancholia.

153] Naturally such a state of affairs could not fail to create a very oppressive atmosphere in the home, and nothing influences children more than these silent facts in the background. They have an extremely contagious effect on the children. The daughters unconsciously imitated their mother's attitude,[7] while the sons sought compensation by remaining, as it were, unconscious lovers, the unconscious love being over-compensated by their conscious rejection of women.

154] As one can imagine, it is not at all easy in practice to deal with such cases. Treatment should really have begun with the mother, or rather with the relations between the father and the mother. I think that an all-round conscious realization of the situation and its implications would have had a salutary effect. Conscious realization prevents the unmentionable atmosphere, the general cluelessness, the blank disregard of the troublesome object; in short, it stops the painful content from being repressed. And though this may seem to cause the individual more suffering, he is at least suffering meaningfully and from something real. Repression has the apparent advantage of clearing the conscious mind of worry, and the spirit of all its troubles, but, to counter that, it causes an indirect suffering from something unreal, namely a neurosis. Neurotic suffering is an unconscious fraud and has no moral merit, as has real suffering. Apart, however, from producing a neurosis the repressed cause of the suffering has other effects: it radiates out into the environment and, if there are children, infects them too. In this way neurotic states are often passed on from generation to generation, like the curse of Atreus. The children are infected indirectly through the attitude they instinctively adopt towards their parents' state of mind: either they fight against it with unspoken protest (though occasionally the protest is vociferous) or else they succumb to a paralysing and compulsive imitation. In both cases they are obliged to do, to feel, and to live not as *they* want, but as their parents want. The more "impressive" the parents are, and the less they accept their own problems (mostly on the excuse of "sparing the children"), the longer the children will have to suffer from the unlived life of their parents and the more they will be forced into fulfilling all the things the parents have repressed and kept unconscious. It is not a question of the parents having to be "perfect" in order to have no deleterious effects on their children. If they really were perfect, it would be a positive catastrophe, for the children would then have no alternative but moral inferiority, unless of course they chose to fight the parents with their own weapons, that is, copy them. But this trick only postpones the final reckoning till the third generation. The repressed problems and the suffering thus fraudulently avoided secrete an insidious poison which seeps into the soul of the child through the thickest walls of silence and through the whited sepulchres of deceit, complacency, and evasion. The child is helplessly exposed to the psychic influence of the parents and is bound to copy their self-deception, their insincerity, hypocrisy, cowardice, self-righteousness, and selfish regard for their own comfort, just as wax takes up the imprint of the seal. The only thing that can save the child from unnatural injury is the efforts of the parents not to shirk the psychic difficulties of life by deceitful manoeuvres or by remaining artificially unconscious, but rather to accept them as tasks, to be as honest with themselves as possible, and to shed a beam of light into the darkest corners of their souls. If they can confess to an understanding ear, so much the better. If for certain reasons they cannot, that is admittedly an aggravation, but not a disadvantage—on the contrary, it is often an advantage, for they are then forced to cope unaided with the thing that is most difficult for them. Public confession, as in the Salvation Army or the Oxford Group, is extremely effective for simple souls who can unbosom themselves *ex profundis*. But such souls are not exactly at home in a fashionable drawing-room, nor are such confessions to be heard there, however indiscreet. Confession, as we know, can also be used for self-deception. The more intelligent and cultured a man is, the more subtly he can humbug himself. No moderately intelligent person should believe himself either a saint or a sinner. Both would be a conscious lie. Rather he should keep shamefacedly silent about his moral qualities, ever mindful of his abysmal sinfulness on the one hand, and of his meritoriously humble insight into this desolate state of affairs on the other. All that the younger Blumhardt[8] remarked to an acquaintance of mine, on his making an agonizingly contrite confession of sin, was: “Do you think God is interested in your miserable muck?” Blumhardt had evidently noted the trick that makes drawing-room confession so attractive.

155] It is not, let me repeat, a question of the parents committing no faults—that would be humanly impossible—but of their recognizing them for what they are. It is not life that must be checked, but unconsciousness; above all, the unconsciousness of the educator. But that means our own unconsciousness, because each one of us is, for better or worse, the educator of his fellow man. For so morally bound up with one another are we human beings that a leader leads the led, and the led mislead the leader.

LECTURE TWO

156] Scientific psychology, to begin with, was either physiological psychology, or a rather unorganized accumulation of observations and experiments dealing with isolated facts and functions. Freud's hypothesis, though certainly one-sided, gave it a liberating push towards a psychology of psychic complexities. His work is really a psychology of the ramifications of the sexual instinct in the human psyche. But despite the undeniable importance of sex, one should not suppose that sex is everything. Such a broad hypothesis is like wearing coloured spectacles: it obliterates the finer shades so that everything is seen under the same lurid hue. It is therefore significant that Freud's first pupil, Alfred Adler, framed an entirely different hypothesis of equally broad applicability. The Freudians usually fail to mention Adler's merits, as they make a fanatical creed of their sex-hypothesis. But fanaticism is always a compensation for hidden doubt. Religious persecutions occur only where heresy is a menace. There is no instinct in man that is not balanced by another instinct. Sex would be absolutely unchecked in man were there not a balancing factor in the form of an equally important instinct destined to counteract an unbridled and therefore destructive functioning of the sexual instinct. The structure of the psyche is not unipolar. Just as sex is a force that sways man with its compelling impulses, so there is a natural force of self-assertion in him which enables him to resist emotional explosions. Even among primitives we find the severest restrictions imposed not only on sex but on other instincts too, without there being any need of the Ten Commandments or of the precepts of the catechism. All restrictions on the blind operation of sex derive from the instinct of self-preservation, which is what Adler's self-assertion amounts to in practice. Unfortunately, Adler in his turn goes too far and, by almost entirely neglecting the Freudian point of view, falls into the same error of one-sidedness and exaggeration. His psychology is the psychology of all the self-assertive tendencies in the human psyche. I admit that a one-sided truth has the advantage of simplicity, but whether it is an adequate hypothesis is another matter. We ought to be able to see that there is much in the psyche that depends on sex—sometimes, indeed, everything; but that at other times very little depends on sex and nearly everything on the instinct of self-preservation, or the power instinct, as Adler called it. Both Freud and Adler make the mistake of assuming the continuous operation of one and the same instinct, as though it were a chemical component that was always present in the same quantity, like the two hydrogen atoms in water. If that were the case, man would be mainly sexual, according to Freud, and mainly self-assertive, according to Adler. But he cannot be both at the same time. Everyone knows that the instincts vary in intensity. Sometimes sex predominates, sometimes self-assertion or some other instinct. That is the simple fact which both investigators have overlooked. When sex predominates, everything becomes sexualized, since everything then expresses or serves the sexual purpose. When hunger predominates, practically everything has to be explained in terms of food. Why do we say, “Don’t take him seriously, it’s his bad day today”? Because we know that a man’s psychology can be profoundly altered by a bad mood. This is even more true when dealing with powerful instincts. Freud and Adler can easily be reconciled if only we will take the trouble to regard the psyche not as a rigid and unalterable system, but as a fluid stream of events which change kaleidoscopically under the alternating influence of different instincts. Hence we may have to explain a man on the Freudian basis before his marriage, and on the Adlerian basis afterwards, which common sense has done all along.[1] Such a combination, however, leaves us in a rather uncomfortable situation. Instead of enjoying the apparent certainty of a single, simple truth, we feel ourselves castaways on a boundless sea of ever-changing conditions, helplessly tossed from one vagary to the next. The protean life of the psyche is a greater, if more inconvenient, truth than the rigid certainty of the one-eyed point of view. It certainly does not make the problems of psychology any easier. But it does free us from the incubus of “nothing but,” which is the insistent leitmotiv of all one-sidedness.

157] As soon as the discussion comes to grips with the problem of instinct, everything gets into a dreadful muddle. How are we to distinguish the instincts from one another? How many instincts are there? What are instincts anyway? Thus you immediately get involved in biology and find yourself in more of a muddle than ever. I would therefore advise restriction to the psychological sphere without any assumptions as to the nature of the underlying biological process. The day may come when the biologist, and maybe even the physiologist, will be able to reach out his hand to the psychologist at the point where they meet after tunnelling from opposite sides through the mountain of the unknown.[2] In the meantime, we must learn to be a little more modest in the face of the psychological facts: instead of knowing so exactly that certain things are "nothing but" sex or "nothing but" the will to power, we should take them more at their face value. Consider religious experience, for instance. Can science be so sure that there is no such thing as a "religious instinct"? Can we really suppose that the religious phenomenon is nothing but a secondary function based on the repression of sex? Can anyone show us those "normal" peoples or races who are free from such silly repressions? But if no one can point to any race, or even a tribe, which is quite free from religious phenomena, then I really do not see how one can justify the argument that religious phenomena are not genuine and are merely repressions of sex. Moreover, has not history provided us with plenty of examples where sex is actually an integral part of religious experience? The same is true of art, which is likewise supposed to be the result of sexual repressions, although even animals have aesthetic and artistic instincts. This ridiculous and well-nigh pathological exaggeration of the importance of sex is itself a symptom of the contemporary spiritual unbalance, owing chiefly to the fact that our age lacks a true understanding of sexuality.[3] Whenever an instinct has been underrated, an abnormal overvaluation is bound to follow. And the more unjust the undervaluation the more unhealthy the subsequent overvaluation. As a matter of fact, no moral condemnation could make sex as hateful as the obscenity and blatant vulgarity of those who exaggerate its importance. The intellectual crudeness of the sexual interpretation makes a right valuation of sex impossible. Thus, probably very much against the personal aspirations of Freud himself, the literature that has followed in his wake is effectively carrying on the work of repression. Before Freud nothing was allowed to be sexual, now everything is nothing but sexual.

158] The preoccupation with sex in psychotherapy is due firstly to the assumption that fixation to the parental imagos is by nature sexual, and secondly to the fact that with many patients sexual fantasies, or those that appear to be such, predominate. Freudian doctrine explains all this in the well-known sexual manner with the laudable intent of freeing the patient from his so-called “sexual” fixation to the parental imagos and initiating him into “normal” life. It speaks, plainly enough, the same language as the patient,[4] and in suitable cases this is of course a distinct advantage, though it becomes a disadvantage as time goes on, because the sexual terminology and ideology bind the problem down to the very level on which it has shown itself to be insoluble. The parents are not just “sexual objects” or “pleasure objects” to be dismissed out of hand; they are, or they represent, vital forces which accompany the child on the winding path of destiny in the form of favourable or dangerous factors, from whose influence even the adult can escape only in limited degree, analysis or no analysis. Father and mother are, whether we know it or not, replaced by something analogous to them—if, that is to say, we succeed in detaching ourselves from them at all. The detachment is possible only if we can step on to the next level. For example, the place of the father is now taken by the doctor, a phenomenon which Freud called the “transference.” But in the place of the mother there is substituted the wisdom of a doctrine. And indeed the great prototype in the Middle Ages was the substitution of Mother Church for the family. In recent times worldly allegiances have taken the place of the spiritual organization of society, for to remain a permanent member of the family has very undesirable psychic consequences and is for that reason rendered impossible even in primitive society by the initiation ceremonies. Man needs a wider community than the family, in whose leading-strings he will be stunted both spiritually and morally. If he is burdened with too much family, if, in later life, his tie to the parents is too strong, he will simply transfer the parental tie to the family he himself has raised (if he ever gets that far), thus creating for his own progeny the same suffocating psychic atmosphere from which he suffered in his youth.

159] No psychic allegiance to any kind of secular organization can ever satisfy the spiritual and emotional demands previously made on the parents. Moreover, it is by no means to the advantage of a secular organization to possess members who make such demands. One can see this clearly enough from the thoughtless expectations which the spiritually immature cherish in regard to “Father State”; and where such misguided yearnings ultimately lead is shown by those countries whose leaders, skilfully exploiting the infantile hopes of the masses by suggestion, have actually succeeded in arrogating to themselves the power and authority of the father. Spiritual impoverishment, stultification, and moral degeneracy have taken the place of spiritual and moral fitness, and produced a mass psychosis that can only lead to disaster. A man cannot properly fulfil even the biological meaning of human existence if this and this only is held up to him as an ideal. Whatever the shortsighted and doctrinaire rationalist may say about the meaning of culture, the fact remains that there is a culture-creating spirit. This spirit is a living spirit and not a mere rationalizing intellect. Accordingly, it makes use of a religious symbolism superordinate to reason, and where this symbolism is lacking or has met with incomprehension, things can only go badly with us. Once we have lost the capacity to orient ourselves by religious truth, there is absolutely nothing which can deliver man from his original biological bondage to the family, as he will simply transfer his infantile principles, uncorrected, to the world at large, and will find there a father who, so far from guiding him, leads him to perdition. Important as it is for a man to be able to earn his daily bread and if possible to support a family, he will have achieved nothing that could give his life its full meaning. He will not even be able to bring his children up properly, and will thus have neglected to take care of the brood, which is an undoubted biological ideal. A spiritual goal that points beyond the purely natural man and his worldly existence is an absolute necessity for the health of the soul; it is the Archimedean point from which alone it is possible to lift the world off its hinges and to transform the natural state into a cultural one.

160] Our psychology takes account of the cultural as well as the natural man, and accordingly its explanations must keep both points of view in mind, the spiritual and the biological. As a medical psychology, it cannot do otherwise than pay attention to the whole man. Since the average doctor has been educated exclusively in the natural sciences and is, therefore, accustomed to see everything as a "natural" phenomenon, it is only to be expected that he will understand psychic phenomena from the same biological angle. This mode of observation has great heuristic value and opens out perspectives which were closed to all ages before us. Thanks to its empirical and phenomenological outlook we now know the facts as they really are; we know what is happening and how it happens, unlike earlier ages which usually had only doctrines and theories about the unknown. One can hardly overestimate the value of strictly scientific biological inquiry; it more than anything else has sharpened the eye of the psychiatrist for factual data and made possible a method of description closely approximating to reality. But this apparently self-evident procedure is not, as it happens, self-evident at all, or rather, in no field of experience is the eye for facts so myopic as in the psyche's perception and observation of itself. Nowhere do prejudices, misinterpretations, value-judgments, idiosyncrasies, and projections trot themselves out more glibly and unashamedly than in this particular field of research, regardless of whether one is observing oneself or one's neighbour. Nowhere does the observer interfere more drastically with the experiment than in psychology. I am tempted to say that one can never verify facts enough, because psychic experience is so extremely delicate and is moreover exposed to countless disturbing influences.

161] Nor should we omit to mention that whereas in all other departments of natural science a physical process is observed by a psychic process, in psychology the psyche observes itself, directly in the subject, indirectly in one's neighbour. One is reminded of the story of the topknot of Baron Munchausen, and consequently one comes to doubt whether psychological knowledge is possible at all. In this matter too the doctor feels grateful to natural science that he does not have to philosophize, but can enjoy living knowledge in and through the psyche. That is to say, although the psyche can never know anything *beyond* the psyche (that would be sheer Baron Munchausen!), it is still possible for two strangers to meet within the sphere of the psychic. They will never know themselves as they are, but only as they appear to one another. In the other natural sciences, the question of what a thing is can be answered by a knowledge that goes beyond the thing in question, namely by a psychic reconstruction of the physical process. But in what, or through what, can the psychic process be repeated? It can only be repeated in and through the psychic; in other words, there is no knowledge *about* the psyche, but only *in* the psyche.

162] Although, therefore, the medical psychologist mirrors the psychic in the psychic, he nevertheless remains, consistently with his empirical and phenomenological approach, within the framework of natural science; but at the same time he departs from it in principle in so far as he undertakes his reconstruction—knowledge and explanation—not in another medium, but in the same medium. Natural science combines two worlds, the physical and the psychic. Psychology does this only in so far as it is psychophysiology. As "pure" psychology its principle of explanation is *ignotum per ignotius,* for it can reconstruct the observed process only in the same medium from which that process is itself constituted. It is rather as if the physicist were unable to do anything except repeat the physical process in all its possible variations, without the aid of any *theoria*. But every psychic process, so far as it can be observed as such, is essentially *theoria*, that is to say, it is a *presentation;* and its reconstruction—or "re-presentation"—is at best only a variant of the same presentation. If it is not that, it is just a compensatory attempt to improve or to find fault, or a piece of polemic or criticism; in either case it means the annulment of the process to be reconstructed. To adopt such a procedure in psychology is about as scientific as the paleontology of the eighteenth century, which interpreted *Andrias Scheuchzeri* (the giant salamander) as a human being who had been drowned in the Flood. This problem becomes acute when we have to do with contents which are difficult to understand, such as dream-images, manic ideas, and the like. Here the interpretation must guard against making use of any other viewpoints than those manifestly given by the content itself. If someone dreams of a lion, the correct interpretation can only lie in the direction of the lion; in other words, it will be essentially an *amplification* of this image. Anything else would be an inadequate and incorrect interpretation, since the image "lion" is a quite unmistakable and sufficiently positive presentation. When Freud asserts that the dream means something other than what it says, this interpretation is a "polemic" against the dream's natural and spontaneous presentation of itself, and is therefore invalid. A scientifically responsible interpretation which proceeds along the line of the image it wishes to interpret cannot be called a tautology; on the contrary, it enlarges the meaning of the image until it becomes, through amplification, a generally valid concept. Even a mathematical grasp of the psyche, were such a thing possible, could only be an algebraically expressed expansion of its meaning. Fechner's psychophysics is just the opposite of this, being an acrobatic attempt to jump over its own head.

163] At this crucial point psychology stands outside natural science. Although sharing with the latter its method of observation and the empirical verification of fact, it lacks the Archimedean point outside and hence the possibility of objective measurement. To that extent psychology is at a disadvantage compared with natural science. Only one other science finds itself in a similar situation, and that is atomic physics, where the process to be observed is modified by the observer. As physics has to relate its measurements to objects, it is obliged to distinguish the observing medium from the thing observed,[5] with the result that the categories of space, time, and causality become relative.

164] This strange encounter between atomic physics and psychology has the inestimable advantage of giving us at least a faint idea of a possible Archimedean point for psychology. The microphysical world of the atom exhibits certain features whose affinities with the psychic have impressed themselves even on the physicists.[6] Here, it would seem, is at least a suggestion of how the psychic process could be "reconstructed" in another medium, in that, namely, of the microphysics of matter. Certainly no one at present could give the remotest indication of what such a “reconstruction” would look like. Obviously it can only be undertaken by nature herself, or rather, we may suppose it to be happening continuously, all the time the psyche perceives the physical world. The case of psychology versus natural science is not altogether hopeless, even though, as said, the issue lies beyond the scope of our present understanding.

165] Psychology can also claim to be one of the humane sciences, or, as they are called in German, the *Geisteswissenschaften*, sciences of the mind. All these sciences of the mind move and have their being within the sphere of the psychic, if we use this term in its limited sense, as defined by natural science. From that point of view “mind” is a psychic phenomenon.[7] But, even as a science of the mind, psychology occupies an exceptional position. The sciences of law, history, philosophy, theology, etc., are all characterized and limited by their subject-matter. This constitutes a clearly defined mental field, which is itself, phenomenologically regarded, a psychic product. Psychology, on the other hand, though formerly counted a discipline of philosophy, is today a natural science and its subject-matter is not a mental product but a natural phenomenon, i.e., the psyche. As such it is among the elementary manifestations of organic nature, which in turn forms one half of our world, the other half being the inorganic. Like all natural formations, the psyche is an irrational datum. It appears to be a special manifestation of life and to have this much in common with living organisms that, like them, it produces meaningful and purposeful structures with the help of which it propagates and continually develops itself. And just as life fills the whole earth with plant and animal forms, so the psyche creates an even vaster world, namely consciousness, which is the self-cognition of the universe.

166] In respect of its natural subject-matter and its method of procedure, modern empirical psychology belongs to the natural sciences, but in respect of its method of explanation it belongs to the humane sciences.[8] On account of this “ambiguity” or “double valence,” doubts have been raised as to its scientific character, firstly on the score of this same ambivalence, secondly, on that of its alleged “arbitrariness.” As to the latter point, it should not be forgotten that there are certain people who regard their psychic processes as purely arbitrary acts. They are naively convinced that everything they think, feel, want, and so on, is a product of their wills and is therefore "arbitrary." They believe that they think their own thoughts and want their own wants, there being no other subject of these activities except themselves. It is apparently impossible for them to admit that psychic activity could ever be carried on without a subject (in this case, of course, the ego). They balk at the idea that the psychic content, which they imagine they themselves have produced, exists in its own right, and is apparently far more the product of itself or of a will other than that of the ego.

167] Here we are up against a fashionable and widespread illusion in favour of the ego. In French they even go so far as to say "J'ai fait un rêve," although the dream is the one psychic content which least of all can be said to have been deliberately willed or created. Conversely, although German possesses the admirable expression "Einfall,"[9] nobody who "had a good idea" would feel the slightest compunction about chalking up this lucky fluke to his own account, as though it were something he had manufactured himself. But that, as the word "Einfall" clearly shows, is precisely not the case, firstly because of the obvious incapacity of the subject, and secondly because of the manifest spontaneity of the trans-subjective psyche. We therefore say in German, as well as in French and English, "The idea occurred to me," which is absolutely correct, seeing that the agent is not the subject but the idea, and that the idea literally dropped in through the roof.

168] These examples point to the objectivity of the psyche: it is a natural phenomenon and nothing "arbitrary." The will, too, is a phenomenon, though "free will" is not a natural phenomenon because it is not observable in itself, but only in the form of concepts, views, convictions, or beliefs. It is therefore a problem which belongs to a pure "science of the mind." Psychology has to confine itself to natural phenomenology if it is not to go poaching on other preserves. But the verification of the psyche's phenomenology is no simple matter, as we can see from this popular illusion concerning the "arbitrariness" of psychic processes.

169] As a matter of fact, there do exist psychic contents which are produced or caused by an antecedent act of the will, and which must therefore be regarded as products of some intentional, purposive, and conscious activity. To that extent a fair proportion of psychic contents are *mental* products. Yet the will itself, like the willing subject, is a phenomenon which rests on an unconscious background, where consciousness appears only as the intermittent functioning of an unconscious psyche. The ego, the subject of consciousness, comes into existence as a complex quantity which is constituted partly by the inherited disposition (character constituents) and partly by unconsciously acquired impressions and their attendant phenomena. The psyche itself, in relation to consciousness, is pre-existent and transcendent. We could therefore describe it, with du Prel,[10] as the transcendental subject.

170] Analytical psychology differs from experimental psychology in that it does not attempt to isolate individual functions (sense functions, emotional phenomena, thought-processes, etc.) and then subject them to experimental conditions for purposes of investigation. It is far more concerned with the total manifestation of the psyche as a natural phenomenon—a highly complex structure, therefore, even though critical examination may be able to divide it up into simpler component complexes. But even these components are extremely complicated and, in their basic features, inscrutable. The boldness of our psychology in daring to operate with such unknowns would be presumptuous indeed, were it not that a higher necessity absolutely requires its existence and affords it help. We doctors are forced, for the sake of our patients, to treat obscure complaints which are hard or impossible to understand, sometimes with inadequate and therapeutically doubtful means, and to summon up the necessary courage and the right feeling of responsibility. We have, for professional reasons, to tackle the darkest and most desperate problems of the soul, conscious all the time of the possible consequences of a false step.

171] The difference between this and all earlier psychologies is that analytical psychology does not hesitate to tackle even the most difficult and complicated processes. Another difference lies in our method of procedure. We have no laboratory equipped with elaborate apparatus. Our laboratory is the world. Our tests are concerned with the actual, day-to-day happenings of human life, and the test-subjects are our patients, relatives, friends, and, last but not least, ourselves. Fate itself plays the role of experimenter. There are no needle-pricks, artificial shocks, surprise-lights, and all the paraphernalia of laboratory experiment; it is the hopes and fears, the pains and joys, the mistakes and achievements of real life that provide us with our material.

172] Our aim is the best possible understanding of life as we find it in the human soul. What we learn through understanding will not, I sincerely hope, petrify into intellectual theory, but will become an instrument which, through practical application, will improve in quality until it can serve its purpose as perfectly as possible. Its main purpose is the better adaptation of human behaviour, and adaptation in two directions (illness is faulty adaptation). The human being must be adapted on two fronts, firstly to external life—profession, family, society—and secondly to the vital demands of his own nature. Neglect of the one or the other imperative leads to illness. Although it is true that anyone whose unadaptedness reaches a certain point will eventually fall ill, and will therefore also be a failure in life, yet not everybody is ill merely because he cannot meet the demands of the outside world, but rather because he does not know how to use his external adaptedness for the good of his most personal and intimate life and how to bring it to the right pitch of development. Some people become neurotic for external reasons, others for internal ones. It can easily be imagined how many different psychological formulations there must be in order to do justice to such diametrically opposite types. Our psychology inquires into the reasons for the pathogenic failure to adapt, following the slippery trail of neurotic thinking and feeling until it finds the way back to life. Our psychology is therefore an eminently practical science. It does not investigate for investigation’s sake, but for the immediate purpose of giving help. We could even say that learning is its by-product, but not its principal aim, which is again a great difference from what one understands by “academic” science.

173] It is obvious that the purpose and inmost meaning of this new psychology is educational as well as medical. Since every individual is a new and unique combination of psychic elements, the investigation of truth must begin afresh with each case, for each "case" is individual and not derivable from any preconceived formula. Each individual is a new experiment of life in her ever-changing moods, and an attempt at a new solution or new adaptation. We miss the meaning of the individual psyche if we interpret it on the basis of any fixed theory, however fond of it we may be. For the doctor this means the individual study of every case; for the teacher, the individual study of every pupil. I do not mean that you should begin each investigation from the very bottom. What you already understand needs no investigating. I speak of "understanding" only when the patient or pupil can agree with the interpretations offered; understanding that goes over your patient's head is an unsafe business for both. It might be fairly successful with a child, but certainly not with an adult of any mental maturity. In any case of disagreement the doctor must be ready to drop all his arguments for the sole purpose of finding the truth. There are naturally cases where the doctor sees something which is undoubtedly there, but which the patient will not or cannot admit. As the truth is often hidden as much from the doctor as from the patient, various methods have been evolved for gaining access to the unknown contents. I purposely say "unknown" and not "repressed" because I think it altogether wrong to assume that whenever a content is unknown it is necessarily repressed. The doctor who really thinks that way gives the appearance of knowing everything beforehand. Such a pretence stymies the patient and will most likely make it impossible for him to confess the truth. At all events the know-all attitude takes the wind out of his sails, though this is sometimes not altogether unwelcome to him, as he can then guard his secret the more easily, and it is so much more convenient to have his truth handed to him by the analyst than be forced to realize and confess it himself. In this way nobody is the gainer. Moreover, this superior knowing in advance undermines the patient's independence of mind, a most precious quality that should on no account be injured. One really cannot be careful enough, as people are incredibly eager to be rid of themselves, running after strange gods whenever occasion offers.

174] There are four methods of investigating the unknown in a patient.

175] The first and simplest method is the ASSOCIATION METHOD. I do not think I need go into details here, as this method has been known for the last fifty years. Its principle is to discover the main complexes through disturbances in the association experiment. As an introduction to analytical psychology and to the symptomatology of complexes, this method is recommended for every beginner.[11]

176] The second method, SYMPTOM-ANALYSIS, has a merely historical value and was given up by Freud, its originator, long ago. By means of hypnotic suggestion it was attempted to get the patient to reproduce the memories underlying certain pathological symptoms. The method works very well in all cases where a shock, a psychic injury, or a trauma is the chief cause of the neurosis. It was on this method that Freud based his earlier trauma theory of hysteria. But since most cases of hysteria are not of traumatic origin, this theory was soon discarded along with its method of investigation. In a case of shock the method can have a therapeutic effect through "abreaction" of the traumatic content. During and after the first World War it was useful in treating shell-shock and similar disorders.[12]

177] The third method, ANAMNESTIC ANALYSIS, is of greater importance as a method both of investigation and of therapy. In practice it consists in a careful anamnesis or reconstruction of the historical development of the neurosis. The material elicited in this way is a more or less coherent sequence of facts told to the doctor by the patient, so far as he can remember them. He naturally omits many details which either seem unimportant to him or which he has forgotten. The experienced analyst who knows the usual course of neurotic development will put questions which help the patient to fill in some of the gaps. Very often this procedure by itself is of great therapeutic value, as it enables the patient to understand the chief factors of his neurosis and may eventually bring him to a decisive change of attitude. It is of course as unavoidable as it is necessary for the doctor not only to ask questions, but to give hints and explanations in order to point out important connections of which the patient is unconscious. While serving as an officer in the Swiss Army Medical Corps, I often had occasion to use this anamnestic method. For instance, there was a nineteen-year-old recruit who reported sick. When I saw the young man he told me straight out that he was suffering from inflammation of the kidneys and that that was the cause of his pains. I wondered how he knew his diagnosis so definitely, whereupon he said that an uncle of his had the same trouble and the same pains in the back. The examination, however, revealed no trace of organic disease. It was obviously a neurosis. I asked for his previous history. The main fact was that the young man had lost both parents rather early and now lived with the uncle he had just mentioned. This uncle was his foster-father, of whom he was very fond. The day before he reported sick he received a letter from his uncle, telling him that he was laid up again with nephritis. The letter affected him unpleasantly and he threw it away at once, without realizing the true cause of the emotion he was trying to repress. Actually, he was very much afraid lest his foster-father should die, and this put him in mind again of his grief at the loss of his parents. As soon as he realized this he had a violent fit of weeping, with the result that he joined the ranks again next morning. It was a case of identification with the uncle, which was uncovered by the anamnesis. The realization of his suppressed emotions had a therapeutic effect.

178] A similar case was that of another recruit, who for weeks before I saw him had been having medical treatment for stomach trouble. I suspected that he was neurotic. The anamnesis revealed that the trouble began when he heard the news that his aunt, who was like a mother to him, had to undergo an operation for cancer of the stomach. Here again the uncovering of the hidden connection had curative results. Simple cases of this kind are quite common, and are accessible to anamnestic analysis. In addition to the favourable effect produced by the realization of previously unconscious connections, it is usual for the doctor to give some good advice, or encouragement, or even a reproof.

179] This is the best practical method for the treatment of neurotic children. With children you cannot very well apply the method of dream-analysis, as it penetrates deep into the unconscious. In the majority of cases you have simply to clear away certain obstacles, and this can be done without much technical knowledge. Generally speaking, a child’s neurosis would be a very simple matter were it not that there is an invariable connection between it and the wrong attitude of the parents. This complication buttresses the child's neurosis against all therapeutic intervention.

180] The fourth method is the ANALYSIS OF THE UNCONSCIOUS. Despite the fact that anamnestic analysis can reveal certain facts of which the patient is unconscious, it is not what Freud would have called "psychoanalysis." In reality there is a remarkable difference between the two methods. The anamnestic method, as I pointed out, deals with conscious contents, or with contents ready for reproduction, while the analysis of the unconscious only begins when the conscious material is exhausted. I beg to point out that I do not call this fourth method "psychoanalysis," as I wish to leave that term entirely to the Freudians. What they understand by psychoanalysis is no mere technique, but a method which is dogmatically bound up with and based upon Freud's sexual theory. When Freud publicly declared that psychoanalysis and his sexual theory were indissolubly wedded, I was obliged to strike out on a different path, as I was unable to endorse his one-sided views. That is also the reason why I prefer to call this fourth method the analysis of the unconscious.

181] As I have emphasized above, this method can only be applied when the conscious contents are exhausted. By this I mean that analysis of the unconscious is possible only after all the conscious material has been properly examined and there is still no satisfactory explanation and solution of the conflict. The anamnestic method often serves as an introduction to the fourth method. By careful examination of his conscious mind you get to know your patient; you establish what the old hypnotists used to call "rapport." This personal contact is of prime importance, because it forms the only safe basis from which to tackle the unconscious. This is a factor that is frequently overlooked, and when it is neglected it may easily lead to all sorts of blunders. Even the most experienced judge of human psychology cannot possibly know the psyche of another individual, so he must depend upon goodwill, i.e., good contact with the patient, and trust him to tell the analyst when anything goes wrong. Very often misunderstandings occur right at the beginning of the treatment, sometimes through no fault of the doctor.

Owing to the very nature of his neurosis, the patient will harbour all kinds of prejudices which are often the direct cause of his neurosis and help to keep it alive. If these misunderstandings are not thoroughly cleared up, they can easily leave behind them a feeling of resentment which reduces all your subsequent efforts to nothing. Of course, if you begin the analysis with a fixed belief in some theory which purports to know all about the nature of neurosis, you apparently make your task very much easier; but you are nevertheless in danger of riding roughshod over the real psychology of your patient and of disregarding his individuality. I have seen any number of cases where the cure was hindered by theoretical considerations. Without exception the failure was due to lack of contact. It is only the most scrupulous observation of this rule that can prevent unforeseen catastrophes. So long as you feel the human contact, the atmosphere of mutual confidence, there is no danger; and even if you have to face the terrors of insanity, or the shadowy menace of suicide, there is still that area of human faith, that certainty of understanding and of being understood, no matter how black the night. It is by no means easy to establish such a contact, and you cannot achieve it at all except by a careful comparison of both points of view and by mutual freedom from prejudice. Mistrust on either side is a bad beginning, and so is the forcible breaking down of resistances through persuasion or other coercive measures. Even conscious suggestion as part of the analytical procedure is a mistake, because the patient's feeling of being free to make up his own mind must at all costs be preserved. Whenever I discover the slightest trace of mistrust or resistance I try to take it with the utmost seriousness so as to give the patient a chance to re-establish the contact. The patient should always have a firm foothold in his conscious relation to the doctor, who in his turn needs that contact if he is to be sufficiently informed about the actual state of the patient's consciousness. He needs this knowledge for very practical reasons. Without it, he would not be able to understand his patient's dreams correctly. Therefore, not only in the beginning, but during the whole course of an analysis the personal contact must be the main point of observation, because it alone can prevent extremely disagreeable and surprising discoveries, as well as fatal issues so far as is humanly possible. And not only that, it is above all else a means for correcting the false attitude of the patient, in such a way that he does not feel he is being persuaded against his will or actually outwitted.

182] I should like to give you an illustration of this. A young man of about thirty, obviously very clever and highly intellectual, came to see me, not, he said, for treatment, but only in order to ask one question. He produced a voluminous manuscript, which, so he said, contained the history and analysis of his case. He called it a compulsion neurosis—quite correctly, as I saw when I read the document. It was a sort of psychoanalytical autobiography, most intelligently worked out and showing really remarkable insight. It was a regular scientific treatise, based on wide reading and a thorough study of the literature. I congratulated him on his achievement and asked him what he had really come for. “Well,” he said, “you have read what I have written. Can you tell me why, with all my insight, I am still as neurotic as ever? In theory I should be cured, as I have recalled even my earliest memories. I have read of many people who, with infinitely less insight than I have, were nevertheless cured. Why should I be an exception? Please tell me what it is I have overlooked or am still repressing.” I told him I could not at the moment see any reason why his really astonishing insight had not touched his neurosis. “But,” I said, “allow me to ask you for a little more information about yourself personally.” “With pleasure,” he replied. So I went on: “You mention in your autobiography that you often spend the winter in Nice and the summer in St. Moritz. I take it that you are the son of wealthy parents?” “Oh, no,” he said, “they are not wealthy at all.” “Then no doubt you have made your money yourself?” “Oh, no,” he replied, smiling. “But how is it then?” I asked with some hesitation. “Oh, that does not matter,” he said, “I got the money from a woman, she is thirty-six, a teacher in a council school.” And he added, “It’s a liaison, you know.” As a matter of fact this woman, who was a few years older than himself, lived in very modest circumstances on her meagre earnings as a teacher. She saved the money by stinting herself, naturally in the hope of a later marriage, which this delightful gentleman was not even remotely contemplating. “Don’t you think,” I asked, “that the fact that you are financially supported by this poor woman might be one of the chief reasons why you are not yet cured?” But he laughed at what he called my absurd moral innuendo, which according to him had nothing to do with the scientific structure of his neurosis. “Moreover,” he said, “I have discussed this point with her, and we are both agreed that it is of no importance.” “So you think that by the mere fact of having discussed this situation you have talked the other fact—the fact of your being supported by a poor woman—out of existence? Do you imagine you have any lawful right to the money jingling in your pockets?” Whereupon he rose and indignantly left the room, muttering something about moral prejudices. He was one of the many who believe that morals have nothing to do with neurosis and that sinning on purpose is not sinning at all, because it can be intellectualized out of existence.

183] Obviously I had to tell this young gentleman what I thought of him. If we could have reached agreement on this point, treatment would have been possible. But if we had begun our work by ignoring the impossible basis of his life, it would have been useless. With views like his only a criminal can adapt to life. But this patient was not really a criminal, only a so-called intellectual who believed so much in the power of reason that he even thought he could unthink a wrong he had committed. I believe firmly in the power and dignity of the intellect, but only if it does not violate the feeling-values. These are not just infantile resistances. This example shows what a decisive factor the personal contact is.

184] When the anamnestic stage of analysis is over, that is, when all the conscious material—recollections, questions, doubts, conscious resistances, etc—has been sufficiently dealt with, one can then proceed to the analysis of the unconscious. With this, one enters a new sphere. From now on we are concerned with the living psychic process itself, namely with DREAMS.

185] Dreams are neither mere reproductions of memories nor abstractions from experience. They are the undisguised manifestations of unconscious creative activity. As against Freud’s view that dreams are wish-fulfilments, my experience of dreams leads me to think of them as functions of compensation. When, in the course of analysis, the discussion of conscious material comes to an end, previously unconscious potentialities begin to become activated, and these may easily be productive of dreams. Let me give an example. An elderly lady of fifty-four, but comparatively well preserved, came to consult me about her neurosis, which had begun about one year after the death of her husband twelve years before. She suffered from numerous phobias. Naturally she had a long story to unfold of which I will only mention the fact that, after the death of her husband, she lived by herself in her beautiful country house. Her only daughter was married and lived abroad. The patient was a woman of superficial education only, with a narrow mental horizon, who had learnt nothing in the last forty years. Her ideals and convictions belonged to the eighteen-seventies. She was a loyal widow and clung to her marriage as best she could without her husband. She could not understand in the least what the reason for her phobias could be; certainly it was no question of morals, as she was a worthy member of the church. Such people believe as a rule only in physical causes: phobias have regularly to do with the “heart,” or the “lungs,” or the “stomach.” But strangely enough the doctors had found nothing wrong with those organs. Now she no longer knew what to think about her illness. So I told her that henceforth we would try to see what her dreams had to say on the question of her phobias. Her dreams at that time had the character of snapshots: a gramophone playing a love-song; herself as a young girl, just engaged; her husband as a doctor, and so on. It was quite obvious what they were hinting at. In discussing the problem I was very careful not to call such dreams “Wish-fulfilments,” as she was already far too much inclined to say of her dreams, “Oh, they are nothing but fancies, one dreams such foolish stuff sometimes!” It was very important that she should give serious attention to this problem and feel that it really did concern her. The dreams contained her real intentions, and had to be added to the other contents of consciousness in order to compensate her blind one-sidedness. I call dreams compensatory because they contain ideas, feelings, and thoughts whose absence from consciousness leaves a blank which is filled with fear instead of with understanding. She wished to know nothing about the meaning of her dreams, because she felt it was pointless to think about a question which could not be answered at once. But, like many other people, she failed to notice that by repressing disagreeable thoughts she created something like a psychic vacuum which, as usually happens, gradually became filled with anxiety. Had she troubled herself consciously with her thoughts she would have known what was lacking, and she would then have needed no anxiety states as a substitute for the absence of conscious suffering.

186] Clearly, then, the doctor must know the conscious standpoint of his patient if he wants to have a secure basis for understanding the compensatory intention of dreams.

187] Experience tells us that the meaning and content of dreams are closely related to the conscious attitude. Recurrent dreams correspond to equally recurrent conscious attitudes. In the case just given it is easy to see what the dreams meant. But suppose a young girl, newly engaged, had such dreams: it is certain that they would have quite a different meaning. The analyst, therefore, must have a very good knowledge of the conscious situation, because it may happen that the same dream-motifs mean one thing on one occasion and the exact opposite on another. It is practically impossible, and it is certainly not desirable, to interpret dreams without being personally acquainted with the dreamer. Sometimes, however, one comes across fairly intelligible dreams, particularly with people who know nothing about psychology, where personal knowledge of the dreamer is not necessary for interpretation. Once, on a train journey, I found myself with two strangers in the dining car. The one was a fine-looking old gentleman, the other a middle-aged man with an intelligent face. I gathered from their conversation that they were military men, presumably an old general and his adjutant. After a long silence, the old man suddenly said to his companion, "Isn't it odd what you dream sometimes? I had a remarkable dream last night. I dreamed *I was on parade with a number of young officers, and our commander-in-chief was inspecting us. Eventually he came to me, but instead of asking a technical question he demanded a definition of the beautiful. I tried in vain to find a satisfactory answer, and felt most dreadfully ashamed when he passed on to the next man, a very young major, and asked him the same question. This fellow came out with a damned good answer, just the one I would have given if only 1 could have found it*. This gave me such a shock that I woke up." Then, suddenly and unexpectedly addressing me, a total stranger, he asked, “D’you think dreams can have a meaning?” “Well,” I said, “some dreams certainly have a meaning.” “But what could be the meaning of a dream like that?” he asked sharply, with a nervous twitch of the face. I said, “Did you notice anything peculiar about this young major? What did he look like?” “He looked like me, when I was a young major.” “Well, then,” I said, “it looks as if you had forgotten or lost something which you were still able to do when you were a young major. Evidently the dream was calling your attention to it.” He thought for a while, and then he burst out, “That’s it, you’ve got it! When I was a young major I was interested in art. But later this interest got swamped by routine.” Thereupon he relapsed into silence, and not a word more was spoken. After dinner I had an opportunity of speaking with the man whom I took to be his adjutant. He confirmed my surmise about the old gentleman’s rank, and told me that I had obviously touched on a sore spot, because the general was known and feared as a crusty old disciplinarian who meddled with the most trifling matters that were no concern of his.

188] For the general attitude of this man it would certainly have been better if he had kept and cultivated a few outside interests instead of letting himself be drowned in mere routine, which was neither in his own interest nor in that of his work.

189] Had the analysis been carried further, I could have shown him that he would be well advised to accept the standpoint of the dream. He would thus have been able to realize his one-sidedness, and correct it. Dreams are of inestimable value in this respect, provided that you keep away from all theoretical assumptions, as they only arouse unnecessary resistances in the patient. One such theoretical assumption is the idea that dreams are always repressed wish-fulfilments, generally of an erotic nature. It is far better, in actual practice, not to make any assumptions at all, not even that dreams must of necessity be compensatory. The fewer assumptions you have, and the more you can allow yourself to be acted upon by the dream and by what the dreamer has to say about it, the more easily you will arrive at the meaning of the dream. There are sexual dreams, just as there are hunger dreams, fever dreams, anxiety dreams, and others of a somatogenic nature. Dreams of this kind are clear enough, and no elaborate work of interpretation is needed to uncover their instinctual basis. So, guided by long experience, I now proceed on the principle that a dream expresses exactly what it means, and that any interpretation which yields a meaning not expressed in the manifest dream-image is therefore wrong. Dreams are neither deliberate nor arbitrary fabrications; they are natural phenomena which are nothing other than what they pretend to be. They do not deceive, they do not lie, they do not distort or disguise, but naïvely announce what they are and what they mean. They are irritating and misleading only because we do not understand them. They employ no artifices in order to conceal something, but inform us of their content as plainly as possible in their own way. We can also see what it is that makes them so strange and so difficult: for we have learned from experience that they are invariably seeking to express something that the ego does not know and does not understand. Their inability to express themselves more plainly corresponds to the inability, or unwillingness, of the conscious mind to understand the point in question. To take an example: if only our friend the general had taken the necessary time off from his undoubtedly exhausting duties to consider what it was that prompted him to go poking about in his soldiers' knapsacks—an occupation he would have done better to leave to his subordinates—he would have discovered the reason for his irritability and bad moods, and would thus have spared himself the annoying blow which my innocent interpretation dealt him. He could, with a little reflection, have understood the dream himself, for it was as simple and clear as could be wished. But it had the nasty quality of touching him on his blind spot; indeed it is this blind spot that spoke in the dream.

190] There is no denying that dreams often confront the psychologist with difficult problems, so difficult, indeed, that many psychologists prefer to ignore them, and to echo the lay prejudice that dreams are nonsense. But, just as a mineralogist would be ill advised to throw away his specimens because they are only worthless pebbles, so the psychologist and doctor denies himself the profoundest insight into the psychic life of his clients if he is prejudiced and ignorant enough to gloss over the utterances of the unconscious, not to speak of solving the scientific task which dreams impose on the investigator.

191] Since dreams are not pathological but quite normal phenomena, dream psychology is not the prerogative of the doctor but of psychologists in general. In practice, however, it is chiefly the doctor who will have to concern himself with dreams, because their interpretation offers the key to the unconscious. This key is needed above all by the doctor who has to treat neurotic and psychotic disorders. Sick people have a naturally stronger incentive to probe into their unconscious than have healthy people, and they therefore enjoy an advantage which the others do not share. It is very rare for the normal adult to find that an important part of his education has been neglected, and then to spend a large amount of time and money on getting a deeper insight into himself and a broader equability. As a matter of fact, so very much is lacking to the educated man of today that it is sometimes hard to tell him apart from a neurotic. Besides cases of the latter sort, who obviously need medical attention, there are numerous others who could be helped just as much by a practical psychologist.

192] Treatment by dream-analysis is an eminently educational activity, whose basic principles and conclusions would be of the greatest assistance in curing the evils of our time. What a blessing it would be, for instance, if even a small percentage of the population could be acquainted with the fact that it simply does not pay to accuse others of the faults from which one suffers most of all oneself!

193] The material you have to work with in the analysis of the unconscious consists not only of dreams. There are products of the unconscious which are known as fantasies. These fantasies are either a sort of day-dreaming, or else they are rather like visions and inspirations. You can analyse them in the same way as dreams.

194] There are two principal methods of interpretation which can be applied according to the nature of the case. The first is the so-called reductive method. Its chief aim is to find out the instinctive impulses underlying the dream. Take as an example the dreams of the elderly lady I mentioned a short while back. In her case, certainly, it was most important that she should see and understand the instinctive facts. But in the case of the old general it would have been somewhat artificial to speak of repressed biological instincts, and it is highly unlikely that he was repressing his aesthetic interests. Rather, he drifted away from them through force of habit. In his case, dream-interpretation would have a *constructive* purpose, as we should try to add something to his conscious attitude, rounding it out as it were. His sinking into a routine corresponds to a certain indolence and inertia which is characteristic of the Old Adam in us. The dream was trying to scare him out of it. But in the case of the elderly lady the understanding of the erotic factor would enable her consciously to recognize her primitive female nature, which for her is more important than the illusion of improbable innocence and strait-laced respectability.

195] Thus we apply a largely reductive point of view in all cases where it is a question of illusions, fictions, and exaggerated attitudes. On the other hand, a constructive point of view must be considered for all cases where the conscious attitude is more or less normal, but capable of greater development and refinement, or where unconscious tendencies, also capable of development, are being misunderstood and kept under by the conscious mind. The reductive standpoint is the distinguishing feature of Freudian interpretation. It always leads back to the primitive and elementary. The constructive standpoint, on the other hand, tries to synthesize, to build up, to direct one’s gaze forwards. It is less pessimistic than the other, which is always on the look-out for the morbid and thus tries to break down something complicated into something simple. It may occasionally be necessary for the treatment to destroy pathological structures; but treatment consists just as often, or even oftener, in strengthening and protecting what is healthy and worth preserving, so as to deprive the morbidities of any foothold. You can, if you like, regard not only every dream, but every symptom of illness, every characteristic, every manifestation of life from the reductive point of view, and thus arrive at the possibility of a negative judgment. If you go far enough back in your investigations, then we are all descended from thieves and murderers, and it is easy to show how all humility is rooted in spiritual pride, and every virtue in its corresponding vice. Which point of view he shall decide to adopt in any given case must be left to the insight and experience of the analyst. He will avail himself now of the one and now of the other in accordance with his knowledge of the character and conscious situation of his patient.

196] A few words on the symbolism of dreams and fantasies may not be out of place in this connection. Symbolism has today assumed the proportions of a science and can no longer make do with more or less fanciful sexual interpretations. Elsewhere I have attempted to put symbolism on the only possible scientific foundation, namely that of comparative research.[13] This method seems to have yielded extremely significant results.

197] Dream-symbolism has first of all a personal character which can be elucidated by the dreamer's associations. An interpretation that goes over the dreamer's head is not to be recommended, though it is perfectly possible in the case of certain symbolisms.[14] In order to establish the exact meaning which a dream has for the dreamer personally, the dreamer's collaboration is absolutely essential. Dream-images are many-faceted and one can never be sure that they have the same meaning in another dream or in another dreamer. A relative constancy of meaning is exhibited only by the so-called *archetypal* images.[15]

198] For the practical work of dream-analysis one needs a special knack and intuitive understanding on the one hand, and a considerable knowledge of the history of symbols on the other. As in all practical work with psychology, mere intellect is not enough; one also needs feeling, because otherwise the exceedingly important feeling-values of the dream are neglected. Without these, dream-analysis is impossible. As the dream is dreamed by the whole man, it follows that anyone who tries to interpret the dream must be engaged as a whole man too. “Ars totum requirit hominem,” says an old alchemist. Understanding and knowledge there must be, but they should not set themselves up above the heart, which in its turn must not give way to sentiment. All in all, dream-interpretation is an art, like diagnosis, surgery, and therapeutics in general—difficult, but capable of being learned by those whose gift and destiny it is.

LECTURE THREE

199] Through the analysis and interpretation of dreams we try to understand the tendencies of the unconscious. When I say "tendencies of the unconscious" it sounds very like a personification, as though the unconscious were a conscious being with a will of its own. But from the scientific standpoint it is simply a *quality* of certain psychic phenomena. One cannot even say that there is a definite class of psychic phenomena which regularly and under all circumstances have the quality of being unconscious. Anything may be, or become, unconscious. Anything you forget, or anything from which you divert your attention until it is forgotten, falls into the unconscious. In brief, anything whose energy-tension drops below a certain level becomes subliminal. If, to your lost memories, you add the many subliminal perceptions, thoughts, and feelings, you will get some idea of what constitutes as it were the upper layers of the unconscious.

199a] Such is the material you have to deal with in the first part of a practical analysis. Some of these unconscious contents have the special quality of being actively repressed by the conscious mind. Through the more or less deliberate withdrawal of attention from certain conscious contents, and through active resistance to them, they are eventually expelled from consciousness. A continual mood of resistance keeps these contents artificially below the threshold of potential consciousness. This is a regular occurrence in hysteria. It is the beginning of the personality split which is one of the most conspicuous features of this illness. Despite the fact that repression also occurs in relatively normal individuals, the total loss of repressed memories is a pathological symptom. Repression, however, should be clearly distinguished from suppression. Whenever you want to switch your attention from something in order to concentrate it on something else, you have to suppress the previously existing contents of consciousness, because, if you cannot disregard them, you will not be able to change your object of interest. Normally you can go back to the suppressed contents any time you like; they are always recoverable. But if they resist recovery, it may be a case of repression. In that case there must be some interest somewhere which wants to forget. Suppression does not cause forgetting, but repression definitely does. There is of course a perfectly normal process of forgetting which has nothing to do with repression. Repression is an artificial loss of memory, a self-suggested amnesia. It is not, in my experience, justifiable to assume that the unconscious consists wholly or for the greater part of repressed material. Repression is an exceptional and abnormal process, and the most striking evidence of this is the loss of feeling-toned contents, which one might think would persist in consciousness and remain easily recoverable. It can have effects very similar to those produced by concussion and by other brain injuries (e.g., by poisoning), for these cause an equally striking loss of memory. But whereas in the latter case absolutely all memories of a certain period are affected, repression causes what is called a *systematic amnesia*, where only specific memories or groups of ideas are withdrawn from recollection. In such cases a certain attitude or tendency can be detected on the part of the conscious mind, a deliberate intention to avoid even the bare possibility of recollection, for the very good reason that it would be painful or disagreeable. The idea of repression is quite in place here. This phenomenon can be observed most easily in the association experiment, where certain stimulus words hit the feeling-toned complexes. When they are touched, lapses or falsifications of memory (amnesia or paramnesia) are very common occurrences. Generally the complexes have to do with unpleasant things which one would rather forget and of which one has no wish to be reminded. The complexes themselves are the result, as a rule, of painful experiences and impressions.

200] Unfortunately, this rule is subject to certain limitations. It sometimes happens that even important contents disappear from consciousness without the slightest trace of repression. They vanish automatically, to the great distress of the person concerned and not at all on account of some conscious interest which has engineered the loss and rejoices over it. I am not speaking here of normal forgetting, which is only a natural lowering of energy-tension; I am thinking rather of cases where a motive, a word, image, or person, vanishes without trace from the memory, to reappear later at some important juncture. These are cases of what is called cryptomnesia. (One such case, which concerned Nietzsche, is described in my “Psychology and Pathology of So-called Occult Phenomena,” 1902.[1]) I remember, for instance, meeting a writer who later described our conversation in great detail in his autobiography. But the *pièce de résistance* was missing, namely a little lecture I read him on the origin of certain psychic disturbances. This memory was not in his repertoire. It reappeared, however, most significantly in another of his books devoted to this subject. For, in the last resort, we are conditioned not only by the past, but by the future, which is sketched out in us long beforehand and gradually evolves out of us. This is especially the case with a creative person who does not at first see the wealth of possibilities within him, although they are all lying there ready. So it may easily happen that one of these still unconscious aptitudes is called awake by a “chance” remark or by some other incident, without the conscious mind knowing exactly what has awakened, or even that anything has awakened at all. Only after a comparatively long incubation period does the result hatch out. The initial cause or stimulus often remains permanently submerged. A content that is not yet conscious behaves exactly like an ordinary complex. It irradiates the conscious mind and causes the conscious contents associated with it either to become supercharged, so that they are retained in consciousness with remarkable tenacity, or else to do just the opposite, becoming liable to disappear suddenly, not through repression from above, but through attraction from below. One may even be led to the discovery of certain hitherto unconscious contents through the existence of what one might call “lacunae,” or eclipses in consciousness. It is therefore well worth while to look a bit more closely when you have the vague feeling of having overlooked or forgotten something. Naturally, if you assume that the unconscious consists mainly of repressions, you cannot imagine any creative activity in the unconscious, and you logically arrive at the conclusion that eclipses are nothing but secondary effects following a repression. You then find yourself on a steep slope. The explanation through repression is carried to inordinate lengths, and the creative element is completely disregarded. Causalism is exaggerated out of all proportion and the creation of culture is interpreted as a bogus substitute activity. This view is not only splenetic, it also devalues whatever good there is in culture. It then looks as if culture were only a long-drawn sigh over the loss of paradise, with all its infantilism, barbarity, and primitiveness. In truly neurotic manner it is suggested that a wicked patriarch in the dim past forbade infantile delights on pain of castration. Thus, somewhat too drastically and with too little psychological tact, the castration myth becomes the aetiological culture-myth. This leads on to a specious explanation of our present cultural "discontent,"[2] and one is perpetually smelling out regrets for some lost paradise which one ought to have had. That the sojourn in this barbarous little kindergarten is considerably more discontenting and uncomfortable than any culture up to 1933 is a fact which the weary European has had ample opportunity to verify for himself during the last few years. I suspect that the "discontent" has very personal motivations. Also, one can easily throw dust into one's own eyes with theories. The theory of repressed infantile sexuality or of infantile traumata has served innumerable times in practice to divert one's attention from the actual reasons for the neurosis,[3] that is to say, from all the slacknesses, carelessnesses, callousnesses, greedinesses, spitefulnesses, and sundry other selfishnesses for whose explanation no complicated theories of sexual repression are needed. People should know that not only the neurotic, but everybody, naturally prefers (so long as he lacks insight) never to seek the causes of any inconvenience in himself, but to push them as far away from himself as possible in space and time. Otherwise he would run the risk of having to make a change for the better. Compared with this odious risk it seems infinitely more advantageous either to put the blame on to somebody else, or, if the fault lies undeniably with oneself, at least to assume that it somehow arose of its own accord in early infancy. One cannot of course quite remember how, but if one could remember, then the entire neurosis would vanish on the spot. The efforts to remember give the appearance of strenuous activity, and furthermore have the advantage of being a beautiful red herring. For which reason it may seem eminently desirable, from this point of view also, to continue to hunt the trauma as long as possible.

201] This far from unwelcome argument requires no revision of the existing attitude and no discussion of present-day problems. There can of course be no doubt that many neuroses begin in childhood with traumatic experiences, and that nostalgic yearnings for the irresponsibilities of infancy are a daily temptation to certain patients. But it remains equally true that hysteria, for instance, is only too ready to manufacture traumatic experiences where these are lacking, so that the patient deceives both himself and the doctor. Moreover it still has to be explained why the same experience works traumatically with one child and not with another.

202] Naïveté is out of place in psychotherapy. The doctor, like the educator, must always keep his eyes open to the possibility of being consciously or unconsciously deceived, not merely by his patient, but above all by himself. The tendency to live in illusion and to believe in a fiction of oneself—in the good sense or in the bad—is almost insuperably great. The neurotic is one who falls victim to his own illusions. But anyone who is deceived, himself deceives. Everything can then serve the purposes of concealment and subterfuge. The psychotherapist should realize that so long as he believes in a theory and in a definite method he is likely to be fooled by certain cases, namely by those clever enough to select a safe hiding-place for themselves behind the trappings of the theory, and then to use the method so skilfully as to make the hiding-place undiscoverable.

203] Since there is no nag that cannot be ridden to death, all theories of neurosis and methods of treatment are a dubious affair. So I always find it cheering when businesslike physicians and fashionable consultants aver that they treat patients along the lines of “Adler,” or of “Künkel,” or of “Freud,” or even of “Jung.” There simply is not and cannot be any such treatment, and even if there could be, one would be on the surest road to failure. When I treat Mr. X, I have of necessity to use method X, just as with Mrs. Z I have to use method Z. This means that the method of treatment is determined primarily by the nature of the case. All our psychological experiences, all points of view whatsoever, no matter from what theory they derive, may be of use on the right occasion. A doctrinal system like that of Freud or Adler consists on the one hand of technical rules, and on the other of the pet emotive ideas of its author. Still under the spell of the old pathology, which unconsciously regarded diseases as distinct "entia" in the Paracelsian sense,[3a] each of them thought it possible to describe a neurosis as if it presented a specific and clearly defined clinical picture. In the same way doctors still hoped to capture the essence of the neurosis with doctrinaire classifications and to express it in simple formulae. Such an endeavour was rewarding up to a point, but it only thrust all the unessential features of the neurosis to the forefront, and thus covered up the one aspect that is essential, namely the fact that this illness is always an intensely individual phenomenon. The real and effective treatment of neurosis is always individual, and for this reason the stubborn application of a particular theory or method must be characterized as basically wrong. If it has become evident anywhere that there are not so much illnesses as ill people, this is manifestly the case in neurosis. Here we meet with the most individual clinical pictures it is possible to imagine, and not only that, but we frequently find in the neuroses contents or components of personality which are far more characteristic of the patient as an individual than the somewhat colourless figure he is all too likely to cut in civilian life. Because the neuroses are so extraordinarily individualistic, their theoretical formulation is an impossibly difficult task, as it can only refer to the collective features, i.e., those common to many individuals. But that is precisely the least important thing about the illness, or rather, it is totally irrelevant. Apart from this difficulty there is something else to be considered, the fact, namely, that nearly every psychological principle, every truth relating to the psyche, must, if it is to be made absolutely true, immediately be reversed. Thus one is neurotic because one has repressions or because one does not have repressions; because one's head is full of infantile sex fantasies or because one has no fantasies; because one is childishly unadapted to one's environment or because one is adapted too exclusively to the environment; because one does or because one does not live by the pleasure principle; because one is too unconscious or because one is too conscious; because one is selfish or because one exists too little as a self; and so on. These antinomies, which can be multiplied at will, show how difficult and thankless is the task of theory-building in psychology.

204] I myself have long discarded any uniform theory of neurosis, except for a few quite general points like dissociation, conflict, complex, regression, *abaissement du niveau mental*, which belong as it were to the stock-in-trade of neurosis. In other words, every neurosis is characterized by dissociation and conflict, contains complexes, and shows traces of regression and *abaissement*. These principles are not, in my experience, reversible. But even in the very common phenomenon of repression the antinomial principle is already at work, since the principle "The chief mechanism of neurosis lies in repression" must be reversed because instead of repression we often find its exact opposite, the *drawing away* of a content, its subtraction or abduction, which corresponds to the "loss of soul" so frequently observed among primitives.[4] "Loss of soul" is not due to repression but is clearly a species of seizure, and is therefore explained as sorcery. These phenomena, originally belonging to the realm of magic, have not by any means died out in so-called civilized people.

205] A general theory of neurosis is therefore a premature undertaking, because our grasp of the facts is still far from complete. Comparative research into the unconscious has only begun.

206] Prematurely conceived theories are not without their dangers. Thus the theory of repression, whose validity in a definite field of pathology is incontestable—up to the point where it has to be reversed!—has been extended to creative processes, and the creation of culture relegated to second place, as a mere ersatz product. At the same time the wholeness and healthiness of the creative function is seen in the murky light of neurosis, which is of course an undoubted product of repression in many cases. In this way creativity becomes indistinguishable from morbidity, and the creative individual immediately suspects himself of some kind of illness, while the neurotic has lately begun to believe that his neurosis is an art, or at least a source of art. These would-be artists, however, develop one characteristic symptom: they one and all shun psychology like the plague, because they are terrified that this monster will gobble up their so-called artistic ability. As if a whole army of psychologists could do anything against the power of a god! True productivity is a spring that can never be stopped up. Is there any trickery on earth which could have prevented Mozart or Beethoven from creating? Creative power is mightier than its possessor. If it is not so, then it is a feeble thing, and given favourable conditions will nourish an endearing talent, but no more. If, on the other hand, it is a neurosis, it often takes only a word or a look for the illusion to go up in smoke. Then the supposed poet can no longer write, and the painter's ideas become fewer and drearier than ever, and for all this psychology is to blame. I should be delighted if a knowledge of psychology did have this sanative effect and if it put an end to the neuroticism which makes contemporary art such an unenjoyable problem. Disease has never yet fostered creative work; on the contrary, it is the most formidable obstacle to creation. No breaking down of repressions can ever destroy true creativeness, just as no analysis can ever exhaust the unconscious.

207] The unconscious is the ever-creative mother of consciousness. Consciousness grows out of the unconscious in childhood, just as it did in primeval times when man became man. I have often been asked how the conscious arose from the unconscious. The only possible way to answer this is to infer, from present experience, certain events which lie hidden in the abyss of the past, beyond the reach of science. I do not know whether such an inference is permissible, but it may be that even in those remote times consciousness arose in much the same way as it arises today. There are two distinct ways in which consciousness arises. The one is a moment of high emotional tension, comparable to the scene in *Parsifal* where the hero, at the very moment of greatest temptation, suddenly realizes the meaning of Amfortas' wound. The other way is a state of contemplation, in which ideas pass before the mind like dream-images. Suddenly there is a flash of association between two apparently disconnected and widely separated ideas, and this has the effect of releasing a latent tension. Such a moment often works like a revelation. In every case it seems to be the discharge of energy-tension, whether external or internal, which produces consciousness. Many, though not all, of the earliest memories of infancy still retain traces of these sudden flashes of consciousness. Like the records handed down from the dawn of history, some of them are remnants of real happenings, others are purely mythical; in other words, some were objective in origin, and some subjective. The latter are often extremely symbolical and of great importance for the subsequent psychic life of the individual. Most of the earliest impressions in life are soon forgotten and go to form the infantile layer of what I have called the PERSONAL UNCONSCIOUS. There are definite reasons for this division of the unconscious into two parts. The personal unconscious contains everything forgotten or repressed or otherwise subliminal that has been acquired by the individual consciously or unconsciously. This material has an unmistakably personal stamp. But you can also find other contents which bear hardly any trace of a personal quality, and which appear incredibly strange to the individual. Such contents are frequently found in insanity, where they contribute not a little to the confusion and disorientation of the patient. In the dreams of normal people, too, these strange contents may occasionally appear. When you analyse a neurotic and compare his unconscious material with that of a man suffering from schizophrenia, you are instantly aware of a striking difference. With the neurotic, the material produced is mainly of a personal origin. His thoughts and feelings revolve round his family and his social set, but in a case of insanity the personal sphere is often completely swamped by collective representations. The madman hears the voice of God speaking to him; in his visions he sees cosmic revolutions, and it is just as if a veil has been twitched away from a world of ideas and emotions hitherto concealed. He suddenly begins talking of spirits, demons, witchcraft, secret magical persecutions, and so forth. It is not difficult to guess what this world is: it is the world of the primitive, which remains profoundly unconscious so long as everything is going well, but rises to the surface when some fatality befalls the conscious mind. This impersonal layer of the psyche I have termed the COLLECTIVE UNCONSCIOUS—“collective” because it is not an individual acquisition but is rather the functioning of the inherited brain structure, which in its broad outlines is the same in all human beings, and in certain respects the same even in mammals. The inherited brain is the product of our ancestral life. It consists of the structural deposits or equivalents of psychic activities which were repeated innumerable times in the life of our ancestors. Conversely, it is at the same time the ever-existing a priori type and author of the corresponding activity. Far be it from me to decide which came first, the hen or the egg.

208] Our individual consciousness is a superstructure based on the collective unconscious, of whose existence it is normally quite unaware. The collective unconscious influences our dreams only occasionally, and whenever this happens, it produces strange and marvellous dreams remarkable for their beauty, or their demoniacal horror, or for their enigmatic wisdom—“big dreams,” as certain primitives call them. People often hide such dreams as though they were precious secrets, and they are quite right to think them so. Dreams of this kind are enormously important for the individual’s psychic balance. Often they go far beyond the limits of his mental horizon and stand out for years like spiritual landmarks, even though they may never be quite understood. It is a hopeless undertaking to interpret such dreams reductively, as their real value and meaning lie in themselves. They are spiritual experiences that defy any attempt at rationalization. In order to illustrate what I mean, I should like to tell you the dream of a young theological student.[4a] I do not know the dreamer myself, so my personal influence is ruled out. He dreamed *he was standing in the presence of a sublime hieratic figure called the “white magician,” who was nevertheless clad in a long black robe. This magician had just ended a lengthy discourse with the words “And for that we require the help of the black magician.” Then the door suddenly opened and another old man came in, the “black magician,” who however was dressed in a white robe. He too looked noble and sublime. The black magician evidently wanted to speak with the white, but hesitated to do so in the presence of the dreamer. At that the white magician said, pointing to the dreamer, “Speak, he is an innocent.” So the black magician began to relate a strange story of how he had found the lost keys of paradise and did not know how to use them. He had, he said, come to the white magician for an explanation of the secret of the keys. He told him that the king of the country in which he lived was looking for a suitable monument for himself. His subjects had chanced to dig up an old* *sarcophagus containing the mortal remains of a virgin. The king opened the sarcophagus, threw away the bones and had the sarcophagus buried again for later use. But no sooner had the bones seen the light of day, than the being to whom they had once belonged—the virgin—changed into a black horse that galloped off into the desert. The black magician pursued it across the sandy wastes and beyond, and there after many vicissitudes and difficulties he found the lost keys of paradise*. That was the end of his story and also, unfortunately, of the dream.

209] I think a dream like this will help to make clear the difference between an ordinary, personal dream and the "big" dream. Anybody with an open mind can at once feel the significance of the dream and will agree with me that such dreams come from a "different level" from that of the dreams we dream every night. We touch here upon problems of vast import, and it is tempting to dwell on this subject for a while. Our dream should serve to illustrate the activity of the layers that lie below the personal unconscious. The manifest meaning of the dream takes on a quite special aspect when we consider that the dreamer was a young theologian. It is evident that the relativity of good and evil is being presented to him in a most impressive manner. It would therefore be advisable to probe him on this point, and it would be exceedingly interesting to learn what a theologian has to say about this eminently psychological question. Also the psychologist would be in the highest degree interested to see how a theologian would reconcile himself to the fact that the unconscious, while clearly distinguishing between the opposites, nevertheless recognizes their identity. It is hardly likely that a youthful theologian would consciously have thought of anything so heretical. Who, then, is the thinker of such thoughts? If we further consider that there are not a few dreams in which mythological motifs appear, and that these motifs are absolutely unknown to the dreamer, then the question arises of where such material comes from, since he has never encountered it anywhere in his conscious life, and who or what it is that thinks such thoughts and clothes them in such imagery—thoughts which, moreover, go beyond the dreamer's own mental horizon.[5] In many dreams and in certain psychoses we frequently come across archetypal material, i.e., ideas and associations whose exact equivalents can be found in mythology. From these parallels I have drawn the conclusion that there is a layer of the unconscious which functions in exactly the same way as the archaic psyche that produced the myths.

210] Although dreams in which these mythological parallels appear are not uncommon, the emergence of the collective unconscious, as I have called this myth-like layer, is an unusual event which only takes place under special conditions. It appears in the dreams dreamt at important junctures in life. The earliest dreams of childhood, if we can still remember them, often contain the most astonishing mythologems; we also find the primordial images in poetry and in art generally, while religious experience and dogma are a mine of archetypal lore.

211] The collective unconscious is a problem that seldom enters into practical work with children: their problem lies mainly in adapting themselves to their surroundings. Indeed, their connection with the primordial unconsciousness must be severed, as its persistence would present a formidable obstacle to the development of consciousness, which is what they need more than anything else. But if I were discussing the psychology of people beyond middle life, I should have a good deal more to say about the significance of the collective unconscious. You should always bear in mind that our psychology varies not only according to the momentary predominance of certain instinctive impulses and certain complexes, but according to the individual's life phase. You should be careful, therefore, not to impute an adult's psychology to a child. You cannot treat a child as you would an adult. Above all, the work can never be as systematic as with adults. A real, systematic dream-analysis is hardly possible, because with children the unconscious should not be stressed unnecessarily: one can easily arouse an unwholesome curiosity, or induce an abnormal precociousness and self-consciousness, by going into psychological details which are of interest only to the adult. When you have to handle difficult children, it is better to keep your knowledge of psychology to yourself, as simplicity and common sense are what they need most.[6] Your analytical knowledge should serve your own attitude as an educator first of all, because it is a well-known fact that children have an almost uncanny instinct for the teacher's personal shortcomings. They know the false from the true far better than one likes to admit. Therefore the teacher should watch his own psychic condition, so that he can spot the source of the trouble when anything goes wrong with the children entrusted to his care. He himself may easily be the unconscious cause of evil. Naturally we must not be too naïve in this matter: there are people, doctors as well as teachers, who secretly believe that a person in authority has the right to behave just as he likes, and that it is up to the child to adapt as best he may, because sooner or later he will have to adapt to real life which will treat him no better. Such people are convinced at heart that the only thing that matters is material success, and that the only real and effective moral restraint is the policeman behind the penal code. Where unconditional adaptation to the powers of this world is accepted as the supreme principle of belief, it would of course be vain to expect psychological insight from a person in authority as a moral obligation. But anyone who professes a democratic view of the world cannot approve of such an authoritarian attitude, believing as he does in a fair distribution of burdens and advantages. It is not true that the educator is always the one who educates, and the child always the one to be educated. The educator, too, is a fallible human being, and the child he educates will reflect his failings. Therefore it is wise to be as clear-sighted as possible about one's subjective views, and particularly about one's faults. As a man is, so will be his ultimate truth, and so also his strongest effect on others.

212] The psychology of children's neuroses can only be described very inadequately in general systematic terms, for, with few exceptions, the unique or individual features are overwhelmingly preponderant, as is usually also the case with the neuroses of adults. Here as there diagnoses and classifications have little meaning when weighed against the individual peculiarity of each case. Instead of a general description I should like to give you some examples from case histories, which I owe to the friendly collaboration of my pupil Frances G. Wickes, formerly consulting psychologist at St. Agatha's School, New York City.[7]

213] The first case is that of a boy seven years old. He had been diagnosed as mentally defective. The boy showed lack of coordination in walking, squinted in one eye and had an impediment in his speech. He was given to sudden outbursts of temper, and would keep the house in an uproar with his wild rages, throwing things about and threatening to kill the family. He liked to tease and to show off. At school he bullied the other children; he could not read, or take his place in class with children of the same age. After he had been at school for about six months, the rages increased until there were several each day. He was a first child, had been happy and friendly enough up to the age of five and a half, but between three and four he developed night terrors. He was late in learning to talk. The tongue was found to be tied, and an operation was performed. He could still hardly articulate at five and a half, and it was then discovered that the ligaments had not been properly cut. This was remedied. When he was five, a small brother was born. At first he was delighted, but as the baby grew older he seemed at times to hate him. As soon as his little brother began to walk, which he did unusually early, our patient started his wild tempers. He would show great vindictiveness, alternating with moods of affection and remorse. As these rages seemed to be brought on by almost anything, no matter how trifling, nobody thought of jealousy. As the rages increased, so the night terrors abated. Intelligence tests showed unusual ability in thinking. He was delighted at every success and became friendly when encouraged, but was irritable over failures. The parents were brought to understand that the rages were compensatory power manifestations which he developed on realizing his own impotence, firstly when he saw how his little brother was praised and admired for doing with perfect ease the very thing that was impossible for him, and then in having to compete on such unequal terms with the other children at school. While he had remained the only child, whose parents lavished special care on him because of his handicaps, he was happy; but when he tried to hold his own on such unequal terms he became like a wild animal trying to break the chain. The rages, which the mother said were apt to occur “when some little bit of a thing went wrong,” were often found to be connected with the times when the little brother was made to show off his tricks before visitors.

214] The boy soon developed very good relations with the psychologist, whom he called his “friend.” He began to talk to her without falling into his rages. He would not tell his dreams, but would indulge in bombastic fantasies about how he was going to kill everybody and cut off their heads with a great sword. One day he suddenly interrupted himself and said: “That’s what I’ll do. What do you think of that?” The psychologist laughed and answered, “I think just as you do—it’s all bunk.” Then she gave him a picture of Santa Claus which he had admired, saying, “You and Santa Claus and I know it’s all bunk.” His mother put the picture in the window for him to see, and the next day he caught sight of it in one of his rages. He calmed down at once and remarked, “Santa Claus, that’s all bunk!” and promptly did what he had been told to do. He then began to see his rages as something he enjoyed and used for a definite purpose. He showed remarkable intelligence in discerning his real motives. His parents and teachers co-operated in praising his efforts and not merely his successes. He was made to feel his place as the “eldest son.” Special attention was given to speech training. Gradually he learned to control his rages. For a time the old night terrors became more frequent as the rages subsided, but then they too diminished.

215] One cannot expect a disorder that began so early on the basis of organ inferiorities to be cured at once. It will take years to reach a complete adaptation. A strong feeling of inferiority is obviously at the bottom of this neurosis. It is a clear case of Adlerian psychology, where the inferiority gives rise to a power complex. The symptomatology shows how the neurosis attempted to compensate the loss of efficiency.

216] The second case concerns a little girl about nine years old. She had run a subnormal temperature for three months and was unable to attend school. Otherwise she showed no special symptoms, except loss of appetite and increasing listlessness. The doctor could find no reason for this condition. The father and mother were both sure they had the child’s full confidence, and that she was not worried or unhappy in any way. The mother finally admitted to the psychologist that she and her husband did not get on together, but said that they never discussed their difficulties in front of the child, who was completely unconscious of them. The mother wanted a divorce, but could not make up her mind to face the upheaval it would involve. So everything remained in mid air, and in the meantime the parents made no effort to solve any of the difficulties causing their unhappiness. Both of them had an unduly possessive attachment to the child, who in turn had a terrific father-complex. She slept in her father's room in a little bed next to his and got into his bed in the mornings. She gave the following dream:

> *"I went with Daddy to see Granny. Granny was in a big boat. She wanted me to kiss her and wanted to put her arms round me, but I was afraid of her. Daddy said, 'Well then, I'll kiss Granny!' I didn't want him to do it, as I was afraid something might happen to him. Then the boat moved off and I couldn't find anybody and I felt frightened."*

217] Several times she had dreams about Granny. Once Granny was all mouth, wide open. Another time she dreamt of "a big snake, which came out from under my bed and played with me." She often spoke of the snake dream, and had one or two others like it. The dream about her Granny she told with reluctance, but then confessed that every time her father went away she was frightened he would never come back. She had sized up her parents' situation, and told the psychologist that she knew her mother did not like her father, but she did not want to talk about it, "because it would make them feel bad." When her father was away on business trips she was always afraid he would leave them. She had also noticed that her mother was always happier then. The mother realized that she was no help to the child, but on the contrary only made her ill by leaving the situation unsolved. The parents had either to tackle their difficulties together and try to come to a real understanding, or, if this should prove impossible, decide to separate. Eventually, they chose the latter course, and explained the situation to the child. The mother had been convinced that a separation would harm the child, instead of which her health improved as soon as the real situation came out into the open. She was told that she would not be parted from either parent but would have two homes instead; and although a divided home seems a poor arrangement for any child, her relief at no longer being a prey to vague fears and forebodings was so great that she returned to normal health and to real enjoyment of school and play.

217a] A case like this is often a great puzzle to the general practitioner. He looks in vain for an organic cause of the trouble, not knowing that he ought to look elsewhere, for no medical textbook would admit the possibility that psychic difficulties between father and mother could be responsible for the child's subnormal temperature. But to the analyst such causes are by no means unknown or strange. The child is so much a part of the psychological atmosphere of the parents that secret and unsolved problems between them can influence its health profoundly. The *participation mystique*, or primitive identity, causes the child to feel the conflicts of the parents and to suffer from them as if they were its own. It is hardly ever the open conflict or the manifest difficulty that has such a poisonous effect, but almost always parental problems that have been kept hidden or allowed to become unconscious. The author of these neurotic disturbances is, without exception, the unconscious. Things that hang in the air and are vaguely felt by the child, the oppressive atmosphere of apprehension and foreboding, these slowly seep into the child's soul like a poisonous vapour.

218] What this child seemed to feel most was the unconscious of her father. If a man has no real relations with his wife, then obviously he seeks another outlet. And if he is not conscious of what he is seeking, or if he represses fantasies of that kind, his interest will regress on the one side to the memory-image of his mother, and on the other side it invariably fastens on his daughter, if there is one. This is what might be called unconscious incest. You can hardly hold a man responsible for his unconsciousness, but the fact remains that in this matter nature knows neither patience nor pity, and takes her revenge directly or indirectly through illness and unlucky accidents of all kinds. Unfortunately, it is almost a collective ideal for men and women to be as unconscious as possible in the ticklish affairs of love. But behind the mask of respectability and faithfulness the full fury of neglected love falls upon the children. You cannot blame the ordinary individual, as you cannot expect people to know the attitude they ought to adopt and how they are to solve their love problems within the framework of present-day ideals and conventions. Mostly they know only the negative measures of negligence, procrastination, suppression, and repression. And to know of anything better is admittedly very difficult.

219] The dream about the grandmother shows how the unconscious psychology of the father is penetrating that of the child. It is he who wishes to kiss his mother, and the child feels forced to kiss her in the dream. The grandmother who is “all mouth” suggests swallowing and devouring.[8] Obviously the child is in danger of being swallowed by her father’s regressive libido. That is why she dreams of the snake; for the snake, since ancient times, has always been the symbol of danger: of being caught in coils, or swallowed, or poisoned.[9] This case also shows how apt children are to see very much more than their parents suspect. It is of course not possible for parents to have no complexes at all. That would be superhuman. But they should at least come to terms with them consciously; they should make it a duty to work out their inner difficulties for the sake of the children. They should not take the easy road of repressing them in order to avoid painful discussions. The love problem is part of mankind’s heavy toll of suffering, and nobody should be ashamed of having to pay his tribute. It is a thousand times better in every respect for parents frankly to discuss their problems, instead of leaving their complexes to fester in the unconscious.

220] In a case like this, what would be the use of talking to the child about incestuous fantasies and father-fixations? Such a procedure would only make her believe that it was all the fault of her own immoral or foolish nature, and would burden her with a responsibility which is not hers at all, but really belongs to her parents. She suffers not because she has unconscious fantasies but because her father has them. She is a victim of the wrong atmosphere in the home, and her problem disappears as soon as her parents faced up to theirs.

221] The third case concerns a very intelligent girl of thirteen, reported as anti-social, rebellious, and unable to adapt herself to school conditions. At times she was very inattentive and would give peculiar answers for which she could offer no explanation. She was a big, well-developed girl, apparently in the best of health. She was several years younger than her classmates, trying, with her thirteen years, to lead the life of a young girl of sixteen or seventeen, but without the corresponding capabilities. Physically she was over-developed, puberty having begun when she was barely eleven. She was frightened of her sexual excitability and of her desire to masturbate. Her mother was a woman of brilliant intellect, with an intense will to power, who had early decided that her daughter must be a prodigy. She had forced every intellectual faculty and suppressed all emotional growth. She wanted the child to go to school earlier than anybody else. The father's business took him from home a good deal, and to the girl he seemed more like a shadowy ideal than an actual reality. She suffered from a tremendous pressure of pent-up emotions which fed more upon homosexual fantasies than upon real relationships. She confessed that she sometimes longed to be caressed by a certain teacher, and then suddenly she would fancy that all her clothes had dropped off, so that she lost track of what was being said to her; hence her absurd answers. This is one of her dreams: *"I saw my mother slipping down the bath and I knew she was drowning, but I could not move. Then I grew terribly frightened and started to weep because I had let her drown. I woke up crying."* This dream helped her to bring to the surface the hidden resistances to the unnatural life she was forced to lead. She acknowledged her desire for normal companionship. Little could be done at home, but a change of surroundings, the understanding of her problem, and the frank discussion brought a considerable improvement.

222] This case is simple, but very typical. The role played by the parents is again most conspicuous. It was one of those typical marriages where the father is completely wrapped up in his business, and the mother tries to realize her social ambitions through the child. The child had to be a success in order to satisfy her mother's desires and expectations and to flatter her vanity. A mother like this does not as a rule see the real character of her child at all, or her individual ways and needs. She projects herself into the child and rules her with a ruthless will to power. Such a marriage is all too likely to produce just that psychological situation and to intensify it still further. There seems to have been a considerable distance between husband and wife, as so masculine a woman can hardly have had any real understanding of a man's feelings: the only thing she knows how to get out of him is his money. He pays her in order to keep her in a fairly tolerable mood. All her love turns into ambition and will to power (if indeed she has not been doing this since long before her marriage, unconsciously following the example of her own mother). The children of such mothers are practically nothing more than dolls, to be dressed up and adorned at pleasure. They are nothing but mute figures on the chessboard of their parents' egoism, and the maddening thing is that all this is done under the cloak of selfless devotion to the dear child, whose happiness is the sole aim of the mother's life. But in actual fact the child is not given a grain of real love. That is why she suffers from premature sexual symptoms, like so many other neglected and ill-treated children, while at the same time she is deluged with so-called maternal love. The homosexual fantasies clearly show that her need for real love is not satisfied; consequently she craves love from her teachers, but of the wrong sort. If tender feelings are thrown out at the door, then sex in violent form comes in through the window, for besides love and tenderness a child needs understanding. The right thing in this case would naturally be to treat the mother, which might do something to improve her marriage and deflect her passion from the child, at the same time giving the latter access to her mother's heart. Failing that, one can only try to check the mother's injurious influence by stiffening the child's resistance to her, so that she will at least be able to criticize her mother's faults with fairness and become conscious of her own individual needs. Nothing is more stunting than the efforts of a mother to embody herself in her child, without ever considering that a child is not a mere appendage, but a new and individual creature, often furnished with a character which is not in the least like that of the parents and sometimes seems to be quite frighteningly alien. The reason for this is that children are only nominally descended from their parents, but are actually born from the ancestral stock. Occasionally you have to go back several hundred years to see the family likeness.

223] The child's dream is quite intelligible: it obviously means the death of the mother.[10] Such is the answer of the child's unconscious to the mother's blind ambition. Had she not tried to "kill" her daughter's individuality the unconscious would never have reacted in that way. Certainly you should never start generalizing from the results of such a dream. Death-dreams about the parents are not uncommon, and you might be led to suppose that they are always based on the kind of conditions I have just described. But you should remember that a dream-image does not always have the same meaning in all circumstances. You can never be certain of a dream's meaning unless you are sufficiently acquainted with the conscious situation of the dreamer.

224] The last case I shall mention concerns an eight-year-old girl, Margaret, who suffered from a complaint that does not seem to be causally connected with the parents. It is a complicated case which cannot be dealt with fully in a lecture. I have therefore selected only one important phase in its development. The child had been at school for a year without being able to learn anything, except a little reading. She moved clumsily, went up and down stairs like a child just beginning to walk, had little control of her limbs, and spoke in a whining voice. In conversation she would show intense eagerness at first, then suddenly bury her face in her hands and refuse to say any more. As soon as she started to speak she would burst into a weird gibberish made up of disconnected words. When she tried to write she drew single letters, and then covered the whole paper with scribbles which she called "funnies." Intelligence tests could not be given in the normal way, but in several thinking and feeling tests she got the results of an eleven-year-old, in others barely those of a child of four. She had never been normal. When she was ten days old, blood clots resulting from the difficult birth had to be removed from the cranial cavity. She was watched over day and night and looked after with the greatest care. It soon became apparent that she used her physical disabilities to tyrannize her parents, meanwhile resenting any attempt to help her. The parents tried to compensate her defects by shielding her from reality and by providing her with moral crutches which kept her from struggling to overcome her difficulties and frustrations through an effort of will.

225] The first psychological approach was through the world of imagination. As the child was fairly imaginative, she began to learn to read for the sake of stories, and, once started, she progressed with astonishing rapidity. Too much concentration on one thing made her irritable and excited, but nevertheless there was a steady gain. One day Margaret announced, "I have a twin sister. She is called Anna. She is just like me except that she always wears lovely pink clothes and has glasses. [Glasses meant her weak eyes, which kept her from poring over the books she now loved.] If Anna were here I should work better.” The psychologist suggested that Anna should be asked to come in. Margaret went out into the hall and came back with Anna. Then she tried to write, so as to show Anna. After that, Anna was always present. First Margaret would write, then Anna. One day everything went wrong, and finally she burst out, “I shall never learn to write and it’s all Mother’s fault! I am left-handed, and she never told my first teacher. I had to try to write with my right hand, and now I shall grow up and never be able to write because of Mother.” The psychologist told her of another child who was also left-handed and whose mother had made the same mistake. Margaret inquired eagerly, “So he can’t write at all?” “Oh, no,” said the psychologist, “he writes stories and all sorts of things, only it was harder for him, that’s all. He generally writes with his left hand now. You can write with your left hand if you want to.” “But I like my right hand best.” “Oho, then it doesn’t seem to be all your mother’s fault. I wonder whose fault it is?” Margaret only said, “I don’t know.” Thereupon it was suggested that she might ask Anna. So she went out and came back after a while and said, “Anna says it’s my fault and I had better do some work.” Before this she had always refused to discuss her responsibility, but from now on she would go out of the room, talk it over with Anna, and bring back the result. Sometimes she would come back with all the signs of rebellion, but she always told the truth. Once, after railing against Anna, she said, “But Anna insists, ‘Margaret, it’s your own fault. You’ve got to try.’ “From this she went on to a realization of her own projections. One day she got into a fearful temper with her mother. She burst into the room, shouting, “Mother is horrid, horrid, horrid!” “Who is horrid?” she was asked.” Mother,” she answered. “You might ask Anna,” said the psychologist. There was a long pause, then she said, “Pooh! I guess I know as much as Anna. I’m horrid. I’ll go and tell Mother.” This she did and then returned quietly to her work.

226] As a result of the serious injury at birth the child had not been able to develop properly. She naturally deserved, and received, a good deal of attention from her parents; but it is almost impossible to draw the line and to know exactly how far one should go in considering a child’s incapacities. Somewhere, certainly, the optimum is reached, and if you go beyond that you start spoiling the child. As the first-mentioned case shows, children do feel their inferiority in certain ways, and they begin to compensate by assuming a false superiority. This is only another inferiority, but a moral one; no genuine satisfaction results, and so a vicious circle is begun. The more a real inferiority is compensated by a false superiority, the less the initial inferiority is remedied, and the more it is intensified by the feeling of moral inferiority. This necessarily leads to more false superiority, and so on at an ever increasing rate. Obviously, Margaret needed a great deal of attention and was therefore involuntarily spoiled, so that she learnt to exploit the legitimate devotion of her parents. As a result, she got stuck in her incapacity and defeated her own efforts to extricate herself, remaining more incapable and more infantile than her actual handicaps warranted.

227] Such a condition is most favourable to the growth of a second personality. The fact that her conscious mind fails to progress does not mean in the least that her unconscious personality will also remain at a standstill. This part of herself will advance as time goes on, and the more the conscious part hangs back, the greater will be the dissociation of personality. Then one day the more developed personality will appear on the scene and challenge the regressive ego. This was the case with Margaret: she saw herself confronted by “Anna,” her superior twin sister, who for a while represented her moral reason. Later the two merged into one, and this signified a tremendous advance. In 1902, I published a study of very much the same psychological structure. It was about a young girl of sixteen with a quite extraordinary dissociation of personality. You will find it in my paper on “The Psychology and Pathology of So-called Occult Phenomena.”[11] The educational use which the psychologist made of the second personality brought excellent results, and entirely agreed with the teleological significance of the figure of Anna. The psychic double is a commoner phenomenon than one would expect, although it seldom reaches a degree of intensity that would entitle one to speak of a “double personality.”

* * *

228] About education in general and school education in particular the doctor has little to say from the standpoint of his science, as that is hardly his business. But on the education of difficult or otherwise exceptional children he has an important word to add. He knows only too well from his practical experience what a vital role parental influences and the effects of schooling play even in the life of the adult. He is therefore inclined, when dealing with children's neuroses, to seek the root cause less in the child itself than in its adult surroundings, and more particularly in the parents. Parents have the strongest effect upon the child not only through its inherited constitution, but also through the tremendous psychic influence they themselves exert. That being so, the uneducatedness and unconsciousness of the adult works far more powerfully than any amount of good advice, commands, punishments, and good intentions. But when, as is unfortunately all too often the case, parents and teachers expect the child to make a better job of what they themselves do badly, the effect is positively devastating. Again and again we see parents thrusting their unfulfilled illusions and ambitions on to the child, and forcing it into a role for which it is in no circumstances fitted. I remember being consulted about a badly behaved little boy. From the parents' account I learnt that, at the age of seven, he could neither read nor write, that he would not learn any of his lessons properly, resisting, with unreasoning defiance, every attempt to educate him, and that for two years he had been developing rages in which he smashed everything within reach. He was intelligent enough, so the parents thought, but totally lacking in goodwill. Instead of working he lazed about or played with his decrepit old Teddy bear, which for years had been his only toy. He had been given plenty of other toys, but he viciously destroyed them. They had even engaged a good governess for him, but she could do nothing with him either. He was, after a couple of girls, the first and only son, on whom, so it seemed to me, the mother doted especially. As soon as I saw the child the riddle was solved: the boy was pretty much of an imbecile already, and the mother, who could not endure having a backward son, had so egged on and tormented this essentially harmless and good-natured zany with her ambitions that he went completely berserk out of sheer desperation. When I spoke to the mother after the examination she was outraged by my diagnosis and insisted that I must have made a mistake.

229] The educator should know above all else that talk and officious discipline lead nowhere, that what counts is example. If he unconsciously permits all kinds of viciousness, lies, and bad manners in himself, these will have an incomparably more powerful effect than the best of intentions, which are so easily come by. The doctor therefore believes that the best way to educate others is for the educator himself to be educated, and that he should first try out on himself the psychological profundities he has learnt from text-books, in order to test their efficacy. So long as these efforts are prosecuted with a certain amount of intelligence and patience, he will probably not make such a bad teacher.

V

THE GIFTED CHILD

THE GIFTED CHILD[1]

230] When I visited the United States for the first time, I was much astonished to see that there were no barriers at the railway crossings and no protective hedges alongside the railway track. In the remoter districts the line was actually used as a foot-path. When I voiced my astonishment about this, I was informed, “Only an idiot could fail to see that trains pass along the line at forty to a hundred miles an hour!” Another thing that struck me was that nothing is *verboten;* instead, one is merely “not allowed” to do something, or one is politely requested: “Please don’t ”——.

231] These impressions, and others like them, reduced themselves to the discovery that in America civic life appeals to the intelligence and expects an intelligent response, whereas in Europe it plans for stupidity. America fosters and looks forward to intelligence; Europe looks back to see whether the dumb ones are also coming along. What is worse, Europe takes evil intentions for granted and is forever crying that bossy and officious “Verboten!” into our ears, whereas America addresses herself to people’s common sense and goodwill.

232] Involuntarily I found my thoughts drifting back to my school-days, and there I saw the European prejudice embodied in certain of my teachers. I was not, as a twelve-year-old schoolboy, by any means drowsy or stupid, but often I felt uncommonly bored when the teacher had to busy himself with the slowcoaches. I had the good fortune to possess a genial Latin master who, during the exercises, used to send me to fetch books from the university library, and in these I browsed with delight as I dawdled back by the longest possible route. Boredom, however, was by no means the worst of my experiences. Once, among the numerous and not exactly stimulating themes for an essay, we were given something really interesting. I set to work very seriously and polished my sentences with the greatest care. In happy anticipation of having written the best, or at least one of the better essays, I handed mine in to the teacher. When giving them back he always used to discuss the best essay first, and then the others in order of merit. All the others came before mine, and when the last, feeblest effort was about to be discussed, the teacher inflated himself in a manner that boded disaster, and pronounced the following words: “Jung’s essay is by far the best, but he has composed it frivolously and dashed it off without taking any trouble. Therefore it merits no attention whatever.” “That is not true,” I cried, “I’ve never put so much work into any essay as I did into this.” “That’s a lie!” he shouted. “Look at Smith Minor”—the boy who had produced the worst essay—“*he* took trouble over his. He will get on in life, but you won’t, no, not you—for in life you can’t get away with cleverness and humbug.” I was silent. From that moment I never did a stroke of work during German lessons.

233] This mishap lies more than half a century behind me, and I have no doubt that there have been many changes and improvements in the school since then. But, at the time, it obsessed my thoughts and left me with a feeling of bitterness, though this naturally gave place to better understanding as my experience of life increased. I came to realize that my teacher’s attitude was after all based on the noble precept of helping the weak and eradicating the bad. But, as so often happens with such precepts, they are apt to be elevated to soulless principles which do not bear thinking about further, so that a lamentable caricature of goodness results: one helps the weak and fights against the bad, but at the same time one runs the risk of putting the gifted child in a back place, as though being ahead of one’s fellows were something scandalous and improper. The average person distrusts and readily suspects anything that his intelligence cannot grasp. *Il est trop intelligent*—reason enough for the blackest suspicion! In one of his novels Paul Bourget describes an exquisite scene in the antechamber of some Minister, which serves as the perfect paradigm. A middle-class couple offer this criticism of a celebrated scholar, with whom of course they are not acquainted: “Il doit être de la police secrète, il a l’air si méchant.”

234] I trust you will forgive me for having dwelt so long on autobiographical details. Nevertheless this *Wahrheit* without the *Dichtung* is not just an isolated instance; it is something that happens all too often. The gifted schoolchild faces us with an important task which we cannot ignore, despite that worthy maxim about helping the less gifted. In a country as small as Switzerland we cannot afford, however charitable our aspirations may be, to overlook these much-needed gifted children. Even today we seem to proceed somewhat diffidently in this matter. Not long ago I heard of the following case: An intelligent little girl in one of the lower forms at a primary school suddenly became a bad pupil, much to the astonishment of her parents. The things the child said out of school sounded so comical that her parents got the impression that the children were treated like idiots and were being stultified artificially. So the mother went to see the Principal about it and discovered that the teacher had been trained to cope with defectives and had formerly looked after backward children. Obviously she did not know the first thing about normal ones. Luckily the damage was caught in time, so that the child could be passed on to a normal teacher under whom she soon picked up again.

235] The problem of the gifted child is not at all simple, because he is not distinguished merely by the fact of being a good pupil. Occasionally he is the exact opposite. He may even be notoriously absent-minded, have his head full of other things, be indolent, slovenly, inattentive, badly behaved, self-willed, or evoke the impression of being half asleep. From external observation alone it is sometimes difficult to distinguish the gifted child from a mental defective.

236] Nor should we forget that gifted children are not always precocious, but may on the contrary develop slowly, so that the gift remains latent for a long time. The giftedness can then be spotted only with difficulty. On the other hand too much goodwill and optimism on the part of the teacher can imagine talents that later turn out to be blanks, as in the biography which says: “No signs of genius were observable up to his fortieth year—nor indeed afterwards.”

237] Sometimes the only thing that helps in diagnosing a gift is careful observation of the child’s individuality both in school and at home, which alone enables us to see what is primary disposition and what is secondary reaction. In the gifted child inattentiveness, absent-mindedness, and day-dreaming may prove to be a secondary defence against outside influences, in order that the interior fantasy processes may be pursued undisturbed. Admittedly the mere existence of lively fantasies or peculiar interests is no proof of special gifts, as the same predominance of aimless fantasies and abnormal interests may also be found in the previous history of neurotics and psychotics. What does reveal the gift, however, is the *nature* of these fantasies. For this one must be able to distinguish an intelligent fantasy from a stupid one. A good criterion of judgment is the originality, consistency, intensity, and subtlety of the fantasy structure, as well as the latent possibility of its realization. One must also consider how far the fantasy extends into the child's actual life, for instance in the form of hobbies systematically pursued and other interests. Another important indication is the degree and quality of his interest in general. One sometimes makes surprising discoveries where problem children are concerned, such as a voracious and apparently indiscriminate reading of books, done mostly in the forbidden hours after bedtime, or else some unusual practical accomplishment. All these signs can only be understood by one who takes the trouble to inquire into the reasons for the child's problems, and who is not content merely to pick on the bad qualities. A certain knowledge of psychology—by which I mean common sense and experience—is therefore a desirable requisite in a teacher.

238] The psychic disposition of the gifted child always moves in violent contrasts. That is to say, it is extremely rare for the gift to affect all regions of the psyche uniformly. The general rule is that one or the other region will be so little developed as to entitle us to speak of a defect. Above all the degree of maturity differs enormously. In the region of the gift abnormal precocity may prevail, while outside that region the mental attainment may be below normal for a child of that age. Occasionally this gives rise to a misleading picture: one thinks one is dealing with a rather undeveloped and mentally backward child and, in consequence, fails to credit him with any ability above the normal. Or it may be that a precocious intellect is not accompanied by a corresponding development of verbal facility, so that the child is driven to express himself in a seemingly confused or unintelligible way. In such cases only a careful inquiry into the why and wherefore, and a conscientious deliberation of the answers, can save the teacher from false judgments. But there are also cases where the gift applies to some aptitude not affected by school-work at all. This is particularly true of certain practical accomplishments. I myself remember boys who distinguished themselves at school by their remarkable stupidity, but who were highly efficient at the peasant trades of their parents.

239] While I am on this subject I must not omit to point out that very erroneous views used to be held at one time concerning the gift for mathematics. It was believed that the capacity for logical and abstract thought was, so to speak, incarnate in mathematics and that this was therefore the best discipline if one wanted to think logically. But the mathematical gift, like the musical gift to which it is biologically related, is identical neither with logic nor with intellect, although it makes use of them just as all philosophy and science do. One can be musical without possessing a scrap of intellect, and in the same way astounding feats of calculation can be performed by imbeciles. Mathematical sense can be inculcated as little as can musical sense, for it is a specific gift.

240] The gifted child is faced with complications not only in the intellectual but in the moral sphere, that is, in the province of feeling. The prevarication, lying, and other moral laxities so common in grown-ups can easily become a distressing problem for the morally gifted child. It is just as easy for an adult to disregard moral criticism that springs from feeling, as it is to overlook or underestimate intellectual sensitivity and precocity. The gifts of the heart are not quite so obvious or so impressive as intellectual and technical endowments, and, just as the latter demand special understanding from the teacher, so these other gifts often make the even greater demand that he himself should be educated. For the day will inevitably come when what the educator teaches by word of mouth no longer works, but only what he is. Every educator—and I use the term in its widest sense—should constantly ask himself whether he is actually fulfilling his teachings in his own person and in his own life, to the best of his knowledge and with a clear conscience. Psychotherapy has taught us that in the final reckoning it is not knowledge, not technical skill, that has a curative effect, but the personality of the doctor. And it is the same with education: it presupposes self-education.

241] In saying this I have no wish to set myself up as a judge over the pedagogues; on the contrary, with my many years as active teacher and educator, I must count myself as one of them and await judgment or condemnation with the rest. It is only on the basis of my experience in treating human beings that I venture to draw your attention to the profound practical significance of this fundamental educational truth.

242] There are, besides the gifts of the head, also those of the heart, which are no whit less important, although they may easily be overlooked because in such cases the head is often the weaker organ. And yet people of this kind sometimes contribute more to the well-being of society, and are more valuable, than those with other talents. But, like all gifts, talented feeling has two sides to it. A high degree of empathy, especially noticeable in girls, can adapt itself to the teacher so skilfully as to arouse the impression of a special talent, and moreover on the evidence of no mean achievements. But as soon as the personal influence ceases, the gift fizzles out. It was nothing but an enthusiastic episode conjured into existence through empathy, flaring up like a straw fire and leaving the ashes of disappointment behind.

243] The education of gifted children makes considerable demands upon the intellectual, psychological, moral, and artistic capacities of the educator, demands which, it may be, no teacher can reasonably be expected to fulfil. He would have to be something of a genius himself if he were to do justice to the gift of genius among any of his pupils.

244] Fortunately, however, many gifts seem to have a peculiar ability to take care of themselves, and the closer a gifted child comes to being a genius the more his creative capacity—as the very word “genius” implies—acts like a personality far in advance of his years, one might even say like a divine daemon who not only needs no educating, but against whom it is more necessary to protect the child. Great gifts are the fairest, and often the most dangerous, fruits on the tree of humanity. They hang on the weakest branches, which easily break. In most cases, as I have already suggested, the gift develops in inverse ratio to the maturation of the personality as a whole, and often one has the impression that a creative personality grows at the expense of the human being. Sometimes, indeed, there is such a discrepancy between the genius and his human qualities that one has to ask oneself whether a little less talent might not have been better. What after all is great intellect beside moral inferiority? There are not a few gifted persons whose usefulness is paralysed, not to say perverted, by their human shortcomings. A gift is not an absolute value, or rather, it is such a value only when the rest of the personality keeps pace with it, so that the talent can be applied usefully. Creative powers can just as easily turn out to be destructive. It rests solely with the moral personality whether they apply themselves to good things or to bad. And if this is lacking, no teacher can supply it or take its place.

245] The narrow margin between a gift and its pathological variant makes the problem of educating such children much more difficult. Not only is the gift almost invariably compensated by some inferiority in another sphere, but occasionally it is coupled with a morbid defect. In such cases it is almost impossible to determine whether it is the gift or the psychopathic constitution that predominates.

246] For all these reasons I would hardly like to say whether it would be of advantage to educate particularly gifted pupils in separate classes, as has been proposed.[2] I at least would not care to be the expert upon whom devolved the selection of suitable pupils. Although it would be an enormous help to the gifted ones, we have still to consider the fact that these same pupils do not always come up to the level of their gifts in other respects, human as well as mental. Segregated in a special class, the gifted child would be in danger of developing into a one-sided product. In a normal class, on the other hand, although he might be bored with the subject in which he excelled, the other subjects would serve to remind him of his backwardness, and this would have a useful and much-needed moral effect. For all gifts have the moral disadvantage of causing in their possessor a feeling of superiority and hence an inflation which needs to be compensated by a corresponding humility. But since gifted children are very often spoilt, they come to expect exceptional treatment. My old teacher was well aware of this, and that is why he delivered his moral “knock-out,” from which I failed at the time to draw the necessary conclusions. Since then I have learnt to see that my teacher was an instrument of fate. He was the first to give me a taste of the hard truth that the gifts of the gods have two sides, a bright and a dark. To rush ahead is to invite blows, and if you don't get them from the teacher, you will get them from fate, and generally from both. The gifted child will do well to accustom himself early to the fact that any excellence puts him in an exceptional position and exposes him to a great many risks, the chief of which is an exaggerated self-confidence. Against this the only protection is humility and obedience, and even these do not always work.

247] It therefore seems to me better to educate the gifted child along with the other children in a normal class, and not to underline his exceptional position by transferring him to a special class. When all is said and done, school is a part of the great world and contains in miniature all those factors which the child will encounter in later life and with which he will have to come to terms. Some at least of this necessary adaptation can and should be learnt at school. Occasional clashes are not a catastrophe. Misunderstanding is fatal only when chronic, or when the child's sensitivity is unusually acute and there is no possibility of finding another teacher. That often brings favourable results, but only when the cause of the trouble really does lie with the teacher. This is by no means the rule, for in many cases the teacher has to suffer for the ruin wrought by the child's upbringing at home. Far too often parents who were unable to fulfil their own ambitions embody them in their gifted child, whom they either pamper or else whip up into a showpiece, sometimes very much to his detriment in later years, as is sufficiently evident from the lives of certain infant prodigies.

248] A powerful talent, and especially the Danaän gift of genius, is a fateful factor that throws its shadow early before. The genius will come through despite everything, for there is something absolute and indomitable in his nature. The so-called "misunderstood genius" is rather a doubtful phenomenon. Generally he turns out to be a good-for-nothing who is forever seeking a soothing explanation of himself. Once, in my professional capacity, I was forced to confront a "genius" of this type with the alternative: "Or perhaps you are nothing but a lazy hound?” It was not long before we found ourselves in whole-hearted agreement on this point. Talent, on the other hand, can either be hampered, crippled, and perverted, or fostered, developed, and improved. The genius is as rare a bird as the phoenix, an apparition not to be counted upon. Consciously or unconsciously, genius is something that by God’s grace is there from the start, in full strength. But talent is a statistical regularity and does not always have a dynamism to match. Like genius, it is exceedingly diverse in its forms, giving rise to individual differentiations which the educator ought not to overlook; for a differentiated personality, or one capable of differentiation, is of the utmost value to the community. The levelling down of the masses through suppression of the aristocratic or hierarchical structure natural to a community is bound, sooner or later, to lead to disaster. For, when everything outstanding is levelled down, the signposts are lost, and the longing to be led becomes an urgent necessity. Human leadership being fallible, the leader himself has always been, and always will be, subject to the great symbolical principles, even as the individual cannot give his life point and meaning unless he puts his ego at the service of a spiritual authority superordinate to man. The need to do this arises from the fact that the ego never constitutes the whole of a man, but only the conscious part of him. The unconscious part, of unlimited extent, alone can complete him and make him a real totality.

249] Biologically speaking, the gifted person is a deviation from the mean, and in so far as Lao-tzu’s remark that “high stands on low” is one of the eternal verities, this deviation takes place simultaneously in the heights and depths of the same individual. This produces a tension of opposites in him, which in its turn tempers and intensifies his personality. Like the still waters, the gifted child runs deep. His danger lies not only in deviating from the norm, however favourable this may appear to be, but even more in that inner polarity which predisposes to conflict. Therefore, instead of segregation in special classes, the personal interest and attention of the teacher are likely to be more beneficial. Although the institution of a trained school psychiatrist is thoroughly to be recommended and need not be a mere concession to the craze for what is technically right, I would say, in the light of my own experience, that an understanding heart is everything in a teacher, and cannot be esteemed highly enough. One looks back with appreciation to the brilliant teachers, but with gratitude to those who touched our human feelings. The curriculum is so much necessary raw material, but warmth is the vital element for the growing plant and for the soul of the child.

250] Because there are, among the other pupils, gifted and highly strung natures which ought not to be hemmed in and stifled, the school curriculum should for that very reason never wander too far from the humanities into over specialized fields. The coming generation should at least be shown the doors that lead to the many different departments of life and the mind. And it seems to me especially important for any broad-based culture to have a regard for history in the widest sense of the word. Important as it is to pay attention to what is practical and useful, and to consider the future, that backward glance at the past is just as important. Culture means continuity, not a tearing up of roots through "progress." For the gifted child in particular, a balanced education is essential as a measure of psychic hygiene. As I have said, his gift is one-sided and is almost always offset by some childish immaturity in other regions of the psyche. Childhood, however, is a state of the past. Just as the developing embryo recapitulates, in a sense, our phylogenetic history, so the childpsyche relives "the lesson of earlier humanity," as Nietzsche called it. The child lives in a pre-rational and above all in a prescientific world, the world of the men who existed before us. Our roots lie in that world and every child grows from those roots. Maturity bears him away from his roots and immaturity binds him to them. Knowledge of the universal origins builds the bridge between the lost and abandoned world of the past and the still largely inconceivable world of the future. How should we lay hold of the future, how should we assimilate it, unless we are in possession of the human experience which the past has bequeathed to us? Dispossessed of this, we are without root and without perspective, defenceless dupes of whatever novelties the future may bring. A purely technical and practical education is no safeguard against delusion and has nothing to oppose to the counterfeit. It lacks the culture whose innermost law is the continuity of history, the long procession of man's more than individual consciousness. This continuity which reconciles all opposites also heals the conflicts that threaten the gifted child.

251] Anything new should always be questioned and tested with caution, for it may very easily turn out to be only a new disease. That is why true progress is impossible without mature judgment. But a well-balanced judgment requires a firm standpoint, and this in turn can only rest on a sound knowledge of what has been. The man who is unconscious of the historical context and lets slip his link with the past is in constant danger of succumbing to the crazes and delusions engendered by all novelties. It is the tragedy of all innovators that they empty out the baby with the bath-water. Though the mania for novelty is not, thank heavens, the national vice of the Swiss, we live nevertheless in a wider world that is being shaken by strange fevers of renewal. In face of this frightening and grandiose spectacle, steadiness is demanded of our young men as never before, firstly for the stability of our country, and secondly for the sake of European civilization, which has nothing to gain if the achievements of the Christian past are wiped out.

252] The gifted ones, however, are the torch-bearers, chosen for that high office by nature herself.

VI

THE SIGNIFICANCE OF THE UNCONSCIOUS IN INDIVIDUAL EDUCATION

THE SIGNIFICANCE OF THE UNCONSCIOUS IN INDIVIDUAL EDUCATION[1]

253] In general, one can distinguish three kinds of education:

I. EDUCATION THROUGH EXAMPLE. This kind of education can proceed wholly unconsciously and is therefore the oldest and perhaps the most effective form of all. It is aided by the fact that the child is psychologically more or less identical with its environment, and especially with its parents. This peculiarity is one of the most conspicuous features of the primitive psyche, for which the French anthropologist, Lévy-Bruhl, coined the term “participation mystique.” Because unconscious education through example rests on one of the oldest psychic characteristics, it is effective where all other direct methods fail, as for instance in insanity. Many insane patients have to be made to work in order to keep them from degenerating: to give them advice, or to try to order them about, is in most cases quite useless. But if you just send them along with a group of workers, eventually they get infected by the example of the others and begin to work themselves. In the last analysis, all education rests on this fundamental fact of psychic identity, and in all cases the deciding factor is this seemingly automatic contagion through example. This is so important that even the best methods of conscious education can sometimes be completely nullified by bad example.

254] II. COLLECTIVE EDUCATION. By collective education I do not necessarily mean education *en masse* (as in schools), but education according to rules, principles, and methods. These three things are necessarily of a collective nature, since it is assumed that they are at least valid for and applicable to the large majority of individuals. It is further assumed that they are effective instruments in the hands of all those who have learnt how to manipulate them. We can take it for granted that this kind of education will not produce anything except what is already contained in its premises, and that the individuals it turns out will be moulded by general rules, principles, and methods.

255] To the extent that the individuality of the pupil succumbs to the collective nature of these educational influences, he naturally develops a character much resembling that of another individual, who, though originally quite different, has nevertheless acquiesced in the same way. If there is a large number of individuals who possess this degree of acquiescence, conformity becomes uniformity. The larger the number of individuals who conform, the greater the unconscious pressure of example on all those who, rightly or wrongly, have so far successfully resisted the collective method. And since the example of the crowd exerts a compelling influence through unconscious psychic contagion, it may in the long run have a crushing effect upon those individuals who possess no more than average strength of character, if it does not extinguish them altogether. Provided that the quality of this training is sound, we may naturally expect good results so far as collective adaptation is concerned. On the other hand, an over-idealistic moulding of character can have disastrous consequences for the unique personality of the individual. To educate him into being a good citizen and a useful member of society is certainly a highly desirable goal. But once a certain level of uniformity is overstepped, and collective values are fostered at the expense of individual uniqueness, then you get the type of person who, though he may be a perfect paragon of the educational rules, principles, and methods, and is therefore adapted to all the situations and problems that come within the scope of his educational premises, nevertheless feels insecure in all matters where individual judgments have to be made without recourse to the regulations.

256] Collective education is indeed a necessity and cannot be replaced by anything else. We live in a collective world, and we need collective norms just as much as we need a common language. On no account must the principle of collective education be sacrificed for the sake of developing individual idiosyncrasies, however much we may desire to prevent the more valuable ones from being stifled. We must bear in mind that individual uniqueness is not under all circumstances an asset, not even for the individual himself. When we examine the type of child who resists collective education, we often find that these children are afflicted with various psychic abnormalities, either congenital or acquired. Among them I would also include spoiled and demoralized children. Many such children actually work out their own salvation by throwing themselves on the support of a normally functioning group. In this way they achieve a certain degree of uniformity, and can protect themselves from the injurious effects of their own individualities. I do not at all subscribe to the view that fundamentally man is always good, and that his evil qualities are merely misunderstood good. On the contrary, I hold that there are very many persons who represent such an inferior combination of inherited characteristics that it would be far better both for society and for themselves if they refrained from expressing their individual idiosyncrasies. We can therefore claim with a clear conscience that collective education is, at bottom, of undoubted value, and absolutely sufficient for most people. We must not, however, make it the sovereign principle of education, for there exists a large group of children who require the third form of education, namely *individual* education.

257] III. INDIVIDUAL EDUCATION. In applying this method, all rules, principles, and systems must be subordinated to the one purpose of bringing out the specific individuality of the pupil. This aim is directly opposed to that of collective education, which seeks to level out and make uniform. All children who successfully resist this require individual attention. Among these we naturally find the most diverse types. First of all, there are those who are ineducable as a result of pathological degeneration. These generally fall into the category of mental defectives. Then there are others who, far from being ineducable, exhibit special aptitudes, though of a peculiar or one-sided nature. The most frequent of such peculiarities is the incapacity to understand any form of mathematics not expressed in concrete numbers. For this reason higher mathematics ought always to be optional in schools, since it is in no way connected with the development of logical thinking. For these pupils, mathematics is quite meaningless, and a source of needless torment. The truth is that mathematics presupposes a definite mental aptitude which by no means everybody possesses and which cannot be acquired. For those who do not possess it, mathematics can only be learnt by rote like a jumble of meaningless words. Such persons may be highly gifted in every other way, and may possess the capacity for logical thinking already, or can acquire it more easily through direct instruction in logic.

258] Strictly speaking, of course, a deficiency in mathematical ability cannot be regarded as an individual peculiarity. But it does clearly show how a school curriculum may sin against the psychological peculiarity of a pupil. In the same way, certain widely accepted pedagogic principles may prove to be utterly useless, indeed positively harmful, in all cases where the psychological peculiarity of the pupil calls for an exclusively individual influence. Fairly frequently we find that not only specific rules, but the whole apparatus of educational influence is met by an insurmountable antagonism. In such cases we usually have to do with so-called neurotic children. The teacher is at first inclined to ascribe the difficulties to the morbid disposition of the child, but more careful inquiry will often show that the child comes from a peculiar domestic milieu which is quite sufficient to explain his maladjustment. The child has acquired an attitude at home that unfits him for collective life.

259] It is, of course, quite outside the teacher’s province to change the home atmosphere, although a little good advice can often work wonders even with parents. As a rule, however, the trouble has to be cured in the child himself, and this means finding the right approach to his peculiar psychology so as to render it amenable to influence. As we have already said, the first requisite is thorough knowledge of his home life. We know a great deal when we have found out the causes of a symptom, but still more is needed. The next thing we need to know is what sort of effects the external causes have produced in the child’s psyche. This knowledge we obtain from a thorough investigation of his psychological life-history on the basis of his own and his parents’ statements. Under certain conditions a good deal can be accomplished with just this information. Skilful teachers have applied this method all along, so there is no need for me to dwell on it here.

260] If we realize that the child gradually develops out of the unconscious state into a conscious one, we can understand why practically all environmental influences, or at any rate the most elementary and most lasting of them, are unconscious. The first impressions of life are the strongest and most profound, even though they are unconscious—perhaps indeed for that very reason, for so long as they are unconscious they are not subject to change. We can only correct what is in our consciousness; what is unconscious remains unchanged. Consequently, if we wish to produce a change we must first raise these unconscious contents to consciousness, so as to submit them to correction. This operation is not necessary in cases where a careful investigation of the family environment and of the psychological life-history of the individual has furnished us with the means of influencing him effectively. But in cases where this does not suffice, the investigation must go deeper. It is a species of surgical intervention which can have dire results if performed without adequate technical equipment. It takes considerable medical experience to know just when and where this treatment should be applied. Laymen unfortunately often underestimate the dangers which such interventions entail. By bringing unconscious contents to the surface you artificially create a condition that bears the closest resemblance to a psychosis. The vast majority of mental illnesses (except those of a directly organic nature) are due to a disintegration of consciousness caused by the irresistible invasion of unconscious contents. Accordingly we must know where we can intervene without the risk of harm. Even if no danger threatens from this side, we are still not exempt from certain hazards. One of the commonest consequences of preoccupation with unconscious contents is the development of what Freud called "the transference." Strictly speaking, transference is the projection of unconscious contents upon the person analysing the unconscious. The term "transference," however, is used in a much wider sense and embraces all the exceedingly complex processes which bind the patient to the analyst. This bond can turn into an extremely unpleasant obstacle if inexpertly handled. There are cases where it has even led to suicide. One of the main reasons for this is the coming to consciousness of certain unconscious contents which throw a new and disturbing light on the family situation. Things may come up that transform the patient's love and trust in his parents into resistance and hatred. He then finds himself in an intolerable state of isolation, and will cling desperately to the analyst as his last remaining link with the world. If at this critical juncture the analyst, through some technical blunder, snaps even this link, it can lead straight to suicide.

261] I am therefore of the opinion that so drastic a measure as the analysis of the unconscious should at least be conducted under the control and guidance of a doctor adequately trained in psychiatry and psychology.

262] In what way, then, can unconscious contents be brought to consciousness? As you will realize, it is hardly possible within the compass of a lecture to describe all the ways in which this may be done. The best practical method, though also the most difficult, is the analysis and interpretation of dreams. Dreams are unquestionably products of unconscious psychic activity. Born in sleep without design or assistance on our part, they pass before our inward vision and may suddenly float back into our waking life on a dim remnant of consciousness. Their strange, often irrational and incomprehensible nature may well inspire mistrust of them as reliable sources of information. And indeed our attempts to understand dreams are scarcely in keeping with any known scientific method of calculation and measurement. Our position is more like that of an archaeologist deciphering an unknown script. Yet, if unconscious contents exist at all, dreams are surely in the best position to tell us something about them. To Freud belongs the great honour of having been the first to demonstrate this possibility in our own day, although all previous ages were deeply preoccupied with the mystery of dreams, nor was this interest always purely superstitious. The work of Artemidorus of Daldis (second century A.D.) on dream interpretation is, of its kind, a scientific document not to be despised, nor should we dismiss as valueless the dream interpretations of the Essenes recorded by Flavius Josephus (b. A.D. 37). Nevertheless, had it not been for Freud, science would probably not have returned so soon to dreams as sources of information, despite the enormous attention paid to them by the physicians of antiquity. Even today opinion is still very much divided on this subject. There are in fact many medical psychologists who refuse to analyse dreams, either because the method seems to them too uncertain, too arbitrary, and too difficult, or because they feel no need of the unconscious. I myself am of the contrary opinion, and have been convinced by ample experience that in all difficult cases the patient's dreams can be of incalculable value to the psychiatrist, both as a source of information and as a therapeutic instrument.

263] Coming now to the much-disputed question of dream-analysis, we proceed in a manner not unlike that employed in the deciphering of hieroglyphs. First we assemble all the available material which the dreamer himself can give as regards the dream images. We next exclude any statements that depend upon particular theoretical assumptions, for those are generally quite arbitrary attempts at interpretation. We then inquire into the happenings of the previous day, as well as into the mood and the general plans and purposes of the dreamer in the days and weeks preceding the dream. A more or less intimate knowledge of his circumstances and character is of course a necessary prerequisite. Great care and attention must be given to this preparatory work if we want to get at the meaning of the dream. I have no faith in dream interpretations made on the spur of the moment and concocted out of some preconceived theory. One must be careful not to impose any theoretical assumptions on the dream; in fact, it is always best to proceed as if the dream had no meaning at all, so as to be on one's guard against any possible bias. Dream-analysis may yield entirely unforeseen results, and facts of an exceedingly disagreeable nature may sometimes come to light whose discussion would certainly have been avoided at all costs had we been able to anticipate them. We may also get results that are obscure and unintelligible at first, because our conscious standpoint has still not plumbed the secrets of the psyche. In such cases it is better to adopt a waiting attitude than to attempt a forced explanation. In this kind of work one has to put up with a great many question marks.

264] While we are engaged in collecting all this material certain portions of the dream gradually grow clearer, and we begin to see, in the apparently meaningless jumble of images, some glimmerings of a script—only disconnected sentences at first, then more and more of the context. It will perhaps be best if I give you a few examples of the dreams that occur in the course of an individual education under medical control.[2]

265] I must first acquaint you in some measure with the personality of the dreamer, for without this acquaintance you will hardly be able to transport yourselves into the peculiar atmosphere of the dreams.

266] There are dreams that are pure poems and can therefore only be understood through the mood they convey as a whole. The dreamer is a youth of a little over twenty, still entirely boyish in appearance. There is even a touch of girlishness in his looks and manner of expression. The latter betrays a very good education and upbringing. He is intelligent, with pronounced intellectual and aesthetic interests. His aestheticism is very much in evidence: we are made instantly aware of his good taste and his fine appreciation of all forms of art. His feelings are tender and soft, given to the enthusiasms typical of puberty, but somewhat effeminate. There is no trace of adolescent callowness. Undoubtedly he is too young for his age, a clear case of retarded development. It is quite in keeping with this that he should have come to me on account of his homosexuality. The night preceding his first visit he had the following dream:

267] The dream is clearly a coherent expression of mood. The dreamer’s comments are as follows: “Lourdes is the mystic fount of healing. Naturally I remembered yesterday that I was going to you for treatment and was in search of a cure. There is said to be a well like this at Lourdes. It would be rather unpleasant to go down into the water. The well was ever so deep.”

> *“I am in a lofty cathedral filled with mysterious twilight. They tell me that it is the cathedral at Lourdes. In the centre there is a deep dark well, into which I have to descend.”*

268] Now what does this dream tell us? On the surface it seems clear enough, and we might be content to take it as a kind of poetic formulation of the mood of the day before. But we should never stop there, for experience shows that dreams are much deeper and more significant. One might almost suppose that the dreamer came to the doctor in a highly poetic mood and was entering upon the treatment as though it were a sacred religious act to be performed in the mystical half-light of some awe-inspiring sanctuary. But this does not fit the facts at all. The patient merely came to the doctor to be treated for that unpleasant matter, his homosexuality, which is anything but poetic. At any rate we cannot see from the mood of the preceding day why he should dream so poetically, if we were to accept so direct a causation for the origin of the dream. But we might conjecture, perhaps, that the dream was stimulated precisely by the dreamer’s impressions of that highly unpoetical affair which impelled him to come to me for treatment. We might even suppose that he dreamed in such an intensely poetical manner just because of the unpoeticalness of his mood on the day before, much as a man who has fasted by day dreams of delicious meals at night. It cannot be denied that the thought of treatment, of the cure and its unpleasant procedure, recurs in the dream, but poetically transfigured, and in a guise which meets most effectively the lively aesthetic and emotional needs of the dreamer. He will be drawn on irresistibly by this inviting picture, despite the fact that the well is dark, deep, and cold. Something of the dream-mood will persist after sleep and will even linger on into the morning of the day on which he has to submit to the unpleasant and unpoetical duty of visiting me. Perhaps the drab reality will be touched by the bright, golden after-glow of the dream feeling.

269] Is this, perhaps, the purpose of the dream? That would not be impossible, for in my experience the vast majority of dreams are compensatory. They always stress the other side in order to maintain the psychic equilibrium. But the compensation of mood is not the only purpose of the dream picture. The dream also provides a mental corrective. The patient had of course nothing like an adequate understanding of the treatment to which he was about to submit himself. But the dream gives him a picture which describes in poetic metaphors the nature of the treatment before him. This becomes immediately apparent if we follow up his associations and comments on the image of the cathedral:

> “Cathedral,” he says, “makes me think of Cologne Cathedral. Even as a child I was fascinated by it. I remember my mother telling me of it for the first time, and I also remember how, whenever I saw a village church, I asked if it were Cologne Cathedral. I wanted to be a priest in a cathedral like that.”

270] In these associations the patient is describing a very important experience of his childhood. As in nearly all cases of this kind, he had a particularly close tie with his mother. By this we are not to understand a particularly good or intense *conscious* relationship, but something in the nature of a secret, subterranean tie which expresses itself consciously, perhaps, only in the retarded development of character, i.e., in a relative infantilism. The developing personality naturally veers away from such an unconscious infantile bond; for nothing is more obstructive to development than persistence in an unconscious—one could also say, a psychically embryonic, condition. For this reason instinct seizes on the first opportunity to replace the mother by another object. If it is to be a real mother-substitute, this object must be, in some sense, an analogy of her. This is entirely the case with our patient. The intensity with which his childish fantasy seized upon the symbol of Cologne Cathedral corresponds to the strength of his unconscious need to find a substitute for the mother. The unconscious need is heightened still further in a case where the infantile bond threatens injury. Hence the enthusiasm with which his childish imagination took up the idea of the Church; for the Church is, in the fullest sense, a mother. We speak not only of Mother Church, but even of the Church's womb. In the ceremony known as the *benedictio fontis*, the baptismal font is apostrophized as *immaculatus divini fontis uterus*—"immaculate womb of the divine fount." We naturally think that a man must have known this meaning consciously before it could get to work on his fantasy, and that an unknowing child could not possibly be affected by these significations. Such analogies certainly do not work by way of the conscious mind, but in quite another manner.

271] The Church represents a higher spiritual substitute for the purely natural, or "carnal," tie to the parents. Consequently it frees the individual from an unconscious natural relationship which, strictly speaking, is not a relationship at all but simply a condition of inchoate, unconscious identity. This, just because it is unconscious, possesses a tremendous inertia and offers the utmost resistance to any kind of spiritual development. It would be hard to say what the essential difference is between this condition and the soul of an animal. Now, it is by no means the special prerogative of the Christian Church to try to make it possible for the individual to detach himself from his original, animal-like condition; the Church is simply the latest, and specifically Western, form of an instinctive striving that is probably as old as mankind itself. It is a striving that can be found in the most varied forms among all primitive peoples who are in any way developed and have not yet become degenerate: I mean the institution or rite of initiation into manhood. When he has reached puberty the young man is conducted to the "men's house," or some other place of consecration, where he is systematically alienated from his family. At the same time he is initiated into the religious mysteries, and in this way is ushered not only into a wholly new set of relationships, but, as a renewed and changed personality, into a new world, like one reborn (*quasi modo genitus*). The initiation is often attended by all kinds of tortures, sometimes including circumcision and the like. These practices are undoubtedly very old. They have almost become instinctive mechanisms, with the result that they continue to repeat themselves without external compulsion, as in the "baptisms" of German students or the even more wildly extravagant initiations in American students' fraternities. They have become engraved in the unconscious in the form of a primordial image, an archetype, as St. Augustine calls it.

272] When his mother told him as a little boy about Cologne Cathedral, this primordial image was stirred and awakened to life. But there was no priestly instructor to develop it further, so the child remained in his mother's hands. Yet the longing for a man's leadership continued to grow in the boy, taking the form of homosexual leanings—a faulty development that might never have come about had a man been there to educate his childish fantasies. The deviation towards homosexuality has, to be sure, numerous historical precedents. In ancient Greece, as also in certain primitive communities, homosexuality and education were practically synonymous. Viewed in this light, the homosexuality of adolescence is only a profound misunderstanding of the otherwise very appropriate need for masculine guidance.

273] According to the dream, then, what the initiation of the treatment signifies for the patient is the fulfilment of the true meaning of his homosexuality, i.e., his entry into the world of adult men. All that we have been forced to discuss here in such tedious and long-winded detail, in order to understand it properly, the dream has condensed into a few vivid metaphors, thus creating a picture which works far more effectively on the imagination, feeling, and understanding of the dreamer than any learned discourse. Consequently the patient was better and more intelligently prepared for the treatment than if he had been overwhelmed with medical and pedagogical maxims. For this reason I regard dreams not only as a valuable source of information but as an extraordinarily effective instrument of education and therapy.

274] I shall now give you the second dream, which the patient dreamt on the night following his first visit to me. It makes certain welcome additions to the previous one. I must explain in advance that during the first consultation I did not refer in any way to the dream we have just been discussing. It was not even mentioned. Nor was there a word said that was even remotely connected with the foregoing.

275] The second dream was as follows:

> "*I am in a great Gothic cathedral. At the altar stands a priest. I stand before him with my friend, holding in my hand a little Japanese ivory figure, with the feeling that it is going to be baptized. Suddenly an elderly woman appears, takes the fraternity ring from my friend's finger, and puts it on her own. My friend is afraid that this may bind him in some way. But at the same time there is a sound of wonderful organ music.*"

276] Unfortunately I cannot, within the short space of a lecture, enter into all the details of this exceedingly ingenious dream. Here I will only bring out briefly those points which continue and supplement the dream of the preceding day. The second dream is unmistakably connected with the first: once more the dreamer is in church, that is, in the state of initiation into manhood. But a new figure has been added: the priest, whose absence in the previous situation we have already noted. The dream therefore confirms that the unconscious meaning of his homosexuality has been fulfilled and that a new development can be started. The actual initiation ceremony, that is, the baptism, may now begin. The dream symbolism corroborates what I said before, namely that it is not the prerogative of the Christian Church to bring about such transitions and psychic transformations, but that behind the Church there is a living primordial image which in certain conditions is capable of enforcing them.

277] What, according to the dream, is to be baptized is a little Japanese ivory figure. The patient says of this: "It was a tiny, grotesque little manikin that reminded me of the male organ. It was certainly odd that this member was to be baptized. But after all, with the Jews circumcision is a sort of baptism. That must be a reference to my homosexuality, because the friend standing with me before the altar is the one with whom I have sexual relations. We belong to the same fraternity. The fraternity ring obviously stands for our relationship."

278] We know that in common usage the ring is the token of a bond or relationship, as for example the wedding ring. We can therefore safely take the fraternity ring in this case as symbolizing the homosexual relationship, and the fact that the dreamer appears together with his friend points in the same direction.

279] The complaint to be remedied is homosexuality. The dreamer is to be led out of this relatively childish condition and initiated into the adult state by means of a kind of circumcision ceremony under the supervision of a priest. These ideas correspond exactly to my analysis of the previous dream. Thus far the development has proceeded logically and consistently with the aid of archetypal images. But now a disturbing factor appears to enter. An elderly woman suddenly takes possession of the fraternity ring; in other words, she draws to herself what has hitherto been a homosexual relationship, thus causing the dreamer to fear that he is getting involved in a new relationship with obligations of its own. Since the ring is now on the hand of a woman, a marriage of sorts has been contracted, i.e., the homosexual relationship seems to have passed over into a heterosexual one, but a heterosexual relationship of a peculiar kind, as it concerns an elderly woman. "She is a friend of my mother's," says the patient. "I am very fond of her, in fact she is like a mother to me." From this remark we can see what has happened in the dream: as a result of the initiation the homosexual tie has been cut and a heterosexual relationship substituted for it, a platonic friendship with a woman resembling his mother. In spite of her resemblance to his mother, this woman is not his mother any longer, so the relationship with her signifies a step beyond the mother towards masculinity, and hence a partial conquest of his adolescent homosexuality.

280] The fear of the new tie can easily be understood, firstly as the fear which the woman's resemblance to his mother might naturally arouse—it could be argued that the dissolution of the homosexual tie has led to a complete regression to the mother—and secondly as the fear of the new and unknown factors in the adult heterosexual state with its possible obligations, such as marriage, and so on. That we are in fact concerned here not with a regression but with an advance seems to be confirmed by the music that now peals forth. The patient is musical and especially susceptible to solemn organ music. Therefore music signifies for him a very positive feeling, so in this case it forms an harmonious conclusion to the dream, which in turn is well qualified to leave behind a beautiful, holy feeling for the following morning.

281] If you consider the fact that up to now the patient had seen me for only one consultation, in which little more was discussed than a general anamnesis, you will doubtless agree with me when I say that both dreams make astonishing anticipations. They show the patient's situation in a highly remarkable light, and one that is very strange to the conscious mind, while at the same time they lend to the banal medical situation an aspect that is uniquely attuned to the psychic peculiarities of the dreamer, and thus capable of stringing his aesthetic, intellectual, and religious interests to concert pitch. No better conditions for treatment could possibly be imagined. One is almost persuaded, from the meaning of these dreams, that the patient entered upon the treatment with the utmost readiness and hopefulness, quite prepared to cast aside his boyishness and become a man. In reality, however, this was not the case at all. Consciously he was full of hesitation and resistance; moreover, as the treatment progressed, he constantly showed himself antagonistic and difficult, ever ready to slip back into his previous infantilism. The dreams, therefore, stand in strict contrast to his conscious behaviour. They move along a progressive line and are on the side of the educator. In my opinion they give us a clear view of the specific function of dreams. This function I have called compensation. The unconscious progressiveness and the conscious regressiveness together form a pair of opposites which, as it were, keeps the scales balanced. The influence of the educator tilts the balance in favour of progression. In this way dreams give effective support to our educational efforts and at the same time afford the deepest insight into the intimate fantasy life of the patient. Thus his conscious attitude gradually becomes more understanding and receptive to new influences.

282] From what has been said it might be inferred that, were all dreams to behave in this manner, they would be an incomparable means of access to the most individual secrets of psychic life. In so far as dreams are capable of explanation, this is actually true as a general rule; but the great difficulty nevertheless remains of explaining them. Not only is wide experience and considerable tact needed, but also knowledge. To interpret dreams on the basis of a general theory, or on certain ready-made suppositions, is not merely ineffectual, but a definitely wrong and harmful practice. By the gentle art of persuasion and by the liberal use of alleged dream-mechanisms like inversion, distortion, displacement and what not, the dream can be construed to yield almost any meaning. The same arbitrary procedures were also to be found in the first attempts to decipher hieroglyphs. Before even attempting to understand a dream we ought always to say to ourselves, “This dream can mean anything.” It need not stand in opposition to the conscious attitude, but may simply run parallel to it, which would also be quite in accord with its compensatory function. Moreover, there are dreams that defy every effort at interpretation. Often the only possible thing is to hazard a guess. At any rate, up to the present no open sesame for dreams has been discovered, no infallible method, and no absolutely satisfactory theory. The Freudian hypothesis that all dreams are the disguised fulfilment of sexual and other morally inadmissible wishes I myself cannot corroborate. I must therefore regard the use of this hypothesis and the tactics based upon it as a subjective bias. Indeed, I am persuaded that, in view of the tremendous irrationality and individuality of dreams, it may be altogether outside the bounds of possibility to construct a popular theory. Why should we believe that everything without exception is a fit subject for science? Scientific thinking is only one of the mental faculties at our disposal for understanding the world. It might be better to look upon dreams as being more in the nature of works of art instead of mere observational data for the scientist. The first view seems to me to yield better results because it is nearer to the essential nature of dreams. And this, after all, is the main point, that we should make ourselves aware of our unconscious compensation and thus overcome the one-sidedness and inadequacy of the conscious attitude. So long as other methods of education are efficacious and useful, we do not need the assistance of the unconscious. Indeed it would be a most reprehensible blunder if we tried to substitute analysis of the unconscious for well-tried conscious methods. The analytical method should be strictly reserved for those cases where other methods have failed, and should then be practised only by specialists, or by laymen under specialist control and guidance.

283] The general results of such psychiatric studies and methods are not of mere academic interest to the educator; they may also be of very real help, since in certain cases they furnish him with an insight unattainable without such knowledge.

VII

THE DEVELOPMENT OF PERSONALITY

THE DEVELOPMENT OF PERSONALITY[1]

[284] In somewhat free-handed fashion the last two lines of Goethe's stanza are often quoted:

> The Highest bliss on earth shall be
> The joys of personality![2]

This gives expression to the view that the ultimate aim and strongest desire of all mankind is to develop that fulness of life which is called personality. Nowadays, "personality training" has become an educational ideal that turns its back upon the standardized, mass-produced, "normal" human being demanded by the machine age. It thus pays tribute to the historical fact that the great liberating deeds of world history have sprung from leading personalities and never from the inert mass, which is at all times secondary and can only be prodded into activity by the demagogue. The huzzahs of the Italian nation go forth to the personality of the Duce, and the dirges of other nations lament the absence of strong leaders.[3] The yearning for personality has therefore become a real problem that occupies many minds today, whereas in former times there was only one man who had a glimmering of this question—Friedrich Schiller, whose letters on aesthetic education have lain dormant, like a Sleeping Beauty of literature, for more than a century. We may confidently assert that the "Holy Roman Empire of the German Nation" has not taken much notice of Schiller as an educator. On the other hand, the *furor teutonicus* has hurled itself upon pedagogics (in the strict sense of the education of children), delved into child psychology, ferreted out the infantilism of the adult, and made of childhood such a portentous condition of life and human fate that it completely overshadows the creative meaning and potentialities of adult existence. Our age has been extravagantly praised as the "century of the child." This boundless expansion of the kindergarten amounts to complete forgetfulness of the problems of adult education divined by the genius of Schiller. Nobody will deny or underestimate the importance of childhood; the severe and often life-long injuries caused by stupid upbringing at home or in school are too obvious, and the need for more reasonable pedagogic methods is far too urgent. But if this evil is to be attacked at the root, one must in all seriousness face the question of how such idiotic and bigoted methods of education ever came to be employed, and still are employed. Obviously, for the sole reason that there are half-baked educators who are not human beings at all, but walking personifications of method. Anyone who wants to educate must himself be educated. But the parrot-like book-learning and mechanical use of methods that is still practised today is no education either for the child or for educator. People are everlastingly saying that the child's personality must be trained. While I admire this lofty ideal, I can't help asking who it is that trains the personality? In the first and foremost place we have the parents, ordinary, incompetent folk who, more often than not, are half children themselves and remain so all their lives. How could anyone expect all these ordinary parents to be "personalities," and who has ever given a thought to devising methods for inculcating "personality" into them? Naturally, then, we expect great things of the pedagogue, of the trained professional, who, heaven help us, has been stuffed full of "psychology" and is bursting with ill-assorted views as to how the child is supposed to be constituted and how he ought to be handled. It is presumed that the youthful persons who have picked on education as a career are themselves educated; but nobody, I daresay, will venture to assert that they are all "personalities" as well. By and large, they suffer from the same defective education as the hapless children they are supposed to instruct, and as a rule are as little "personalities" as their charges. Our whole educational problem suffers from a one-sided approach to the child who is to be educated, and from an equally one-sided lack of emphasis on the uneducatedness of the educator. Everyone who has finished his course of studies feels himself to be fully educated; in a word, he feels grown up. He must feel this, he must have this solid conviction of his own competence in order to survive the struggle for existence. Any doubt or feeling of uncertainty would hinder and cripple him, undermining the necessary faith in his own authority and unfitting him for a professional career. People expect him to be efficient and good at his job and not to have doubts about himself and his capabilities. The professional man is irretrievably condemned to be competent.

285] Everyone knows that these conditions are not ideal. But, with reservations, we can say that they are the best possible under the circumstances. We cannot imagine how they could be different. We cannot expect more from the average educator than from the average parent. If he is good at his job, we have to be content with that, just as we have to be content with parents bringing up their children as best they can.

286] The fact is that the high ideal of educating the personality is not for children: for what is usually meant by personality—a well-rounded psychic whole that is capable of resistance and abounding in energy—is an *adult ideal*. It is only in an age like ours, when the individual is unconscious of the problems of adult life, or—what is worse—when he consciously shirks them, that people could wish to foist this ideal on to childhood. I suspect our contemporary pedagogical and psychological enthusiasm for the child of dishonourable intentions: we talk about the child, but we should mean the child in the adult. For in every adult there lurks a child—an eternal child,[4] something that is always becoming, is never completed, and calls for unceasing care, attention, and education. That is the part of the human personality which wants to develop and become whole. But the man of today is far indeed from this wholeness. Dimly suspecting his own deficiencies, he seizes upon child education and fervently devotes himself to child psychology, fondly supposing that something must have gone wrong in his own upbringing and childhood development that can be weeded out in the next generation. This intention is highly commendable, but comes to grief on the psychological fact that we cannot correct in a child a fault that we ourselves still commit. Children are not half as stupid as we imagine. They notice only too well what is genuine and what is not. Hans Andersen’s story of the emperor’s clothes contains a perennial truth. How many parents have come to me with the laudable intention of sparing their children the unhappy experiences they had to go through in their own childhood! And when I ask, “Are you quite sure you have overcome these mistakes yourself?” they are firmly convinced that the damage has long since been repaired. In actual fact it has not. If as children they were brought up too strictly, then they spoil their own children with a tolerance bordering on bad taste; if certain matters were painfully concealed from them in childhood, these are revealed with a lack of reticence that is just as painful. They have merely gone to the opposite extreme, the strongest evidence for the tragic survival of the old sin—a fact which has altogether escaped them.

287] If there is anything that we wish to change in our children, we should first examine it and see whether it is not something that could better be changed in ourselves. Take our enthusiasm for pedagogics. It may be that the boot is on the other leg. It may be that we misplace the pedagogical need because it would be an uncomfortable reminder that we ourselves are still children in many respects and still need a vast amount of educating.

288] At any rate this doubt seems to me to be extremely pertinent when we set out to train our children's "personalities." Personality is a seed that can only develop by slow stages throughout life. There is no personality without definiteness, wholeness, and ripeness. These three qualities cannot and should not be expected of the child, as they would rob it of childhood. It would be nothing but an abortion, a premature pseudo-adult; yet our modern education has already given birth to such monsters, particularly in those cases where parents set themselves the fanatical task of always "doing their best" for the children and "living only for them." This clamant ideal effectively prevents the parents from doing anything about their own development and allows them to thrust their "best" down their children's throats. This so-called "best" turns out to be the very things the parents have most badly neglected in themselves. In this way the children are goaded on to achieve their parents' most dismal failures, and are loaded with ambitions that are never fulfilled. Such methods and ideals only engender educational monstrosities.

289] No one can train the personality unless he has it himself. And it is not the child, but only the adult, who can achieve personality as the fruit of a full life directed to this end. The achievement of personality means nothing less than the optimum development of the whole individual human being. It is impossible to foresee the endless variety of conditions that have to be fulfilled. A whole lifetime, in all its biological, social, and spiritual aspects, is needed. Personality is the supreme realization of the innate idiosyncrasy of a living being. It is an act of high courage flung in the face of life, the absolute affirmation of all that constitutes the individual, the most successful adaptation to the universal conditions of existence coupled with the greatest possible freedom for self-determination. To educate a man to *this* seems to me no light matter. It is surely the hardest task the modern mind has set itself. And it is dangerous too, dangerous to a degree that Schiller never imagined, though his prophetic insight made him the first to venture upon these problems. It is as dangerous as the bold and hazardous undertaking of nature to let women bear children. Would it not be sacrilege, a Promethean or even Luciferian act of presumption, if a superman ventured to grow an homunculus in a bottle and then found it sprouting into a Golem? And yet he would not be doing anything that nature does not do every day. There is no human horror or fairground freak that has not lain in the womb of a loving mother. As the sun shines upon the just and the unjust, and as women who bear and give suck tend God's children and the devil's brood with equal compassion, unconcerned about the possible consequences, so we also are part and parcel of this amazing nature, and, like it, carry within us the seeds of the unpredictable.

290] Our personality develops in the course of our life from germs that are hard or impossible to discern, and it is only our deeds that reveal who we are. We are like the sun, which nourishes the life of the earth and brings forth every kind of strange, wonderful, and evil thing; we are like the mothers who bear in their wombs untold happiness and suffering. At first we do not know what deeds or misdeeds, what destiny, what good and evil we have in us, and only the autumn can show what the spring has engendered, only in the evening will it be seen what the morning began.

291] Personality, as the complete realization of our whole being, is an unattainable ideal. But unattainability is no argument against the ideal, for ideals are only signposts, never the goal.

292] Just as the child must develop in order to be educated, so the personality must begin to sprout before it can be trained. And this is where the danger begins. For we are handling something unpredictable, we do not know how and in what direction the budding personality will develop, and we have learned enough of nature and the world to be somewhat chary of both. On top of that, we were brought up in the Christian belief that human nature is intrinsically evil. But even those who no longer adhere to the Christian teaching are by nature mistrustful and not a little frightened of the possibilities lurking in the subterranean chambers of their being. Even enlightened psychologists like Freud give us an extremely unpleasant picture of what lies slumbering in the depths of the human psyche. So it is rather a bold venture to put in a good word for the development of personality. Human nature, however, is full of the strangest contradictions. We praise the "sanctity of motherhood," yet would never dream of holding it responsible for all the human monsters, the homicidal maniacs, dangerous lunatics, epileptics, idiots and cripples of every description who are born every day. At the same time we are tortured with doubts when it comes to allowing the free development of personality. "Anything might happen then," people say. Or they dish up the old, feebleminded objection to "individualism." But individualism is not and never has been a natural development; it is nothing but an unnatural usurpation, a freakish, impertinent pose that proves its hollowness by crumpling up before the least obstacle. What we have in mind is something very different.

293] Clearly, no one develops his personality because somebody tells him that it would be useful or advisable to do so. Nature has never yet been taken in by well-meaning advice. The only thing that moves nature is causal necessity, and that goes for human nature too. Without necessity nothing budges, the human personality least of all. It is tremendously conservative, not to say torpid. Only acute necessity is able to rouse it. The developing personality obeys no caprice, no command, no insight, only brute necessity; it needs the motivating force of inner or outer fatalities. Any other development would be no better than individualism. That is why the cry of "individualism" is a cheap insult when flung at the natural development of personality.

294] The words "many are called, but few are chosen" are singularly appropriate here, for the development of personality from the germ-state to full consciousness is at once a charisma and a curse, because its first fruit is the conscious and unavoidable segregation of the single individual from the undifferentiated and unconscious herd. This means isolation, and there is no more comforting word for it. Neither family nor society nor position can save him from this fate, nor yet the most successful adaptation to his environment, however smoothly he fits in. The development of personality is a favour that must be paid for dearly. But the people who talk most loudly about developing their personalities are the very ones who are least mindful of the results, which are such as to frighten away all weaker spirits.

295] Yet the development of personality means more than just the fear of hatching forth monsters, or of isolation. It also means fidelity to the law of one's own being.

296] For the word "fidelity" I should prefer, in this context, the Greek word used in the New Testament, πίστις which is erroneously translated "faith." It really means "trust," "trustful loyalty." Fidelity to the law of one's own being is a trust in this law, a loyal perseverance and confident hope; in short, an attitude such as a religious man should have towards God. It can now be seen how portentous is the dilemma that emerges from behind our problem: personality can never develop unless the individual chooses his own way, consciously and with moral deliberation. Not only the causal motive—necessity—but conscious moral decision must lend its strength to the process of building the personality. If the first is lacking, then the alleged development is a mere acrobatics of the will; if the second, it will get stuck in unconscious automatism. But a man can make a moral decision to go his own way only if he holds that way to be the best. If any other way were held to be better, then he would live and develop that other personality instead of his own. The other ways are conventionalities of a moral, social, political, philosophical, or religious nature. The fact that the conventions always flourish in one form or another only proves that the vast majority of mankind do not choose their own way, but convention, and consequently develop not themselves but a method and a collective mode of life at the cost of their own wholeness.

297] Just as the psychic and social life of mankind at the primitive level is exclusively a group life with a high degree of unconsciousness among the individuals composing it, so the historical process of development that comes afterwards is in the main collective and will doubtless remain so. That is why I believe convention to be a collective necessity. It is a stopgap and not an ideal, either in the moral or in the religious sense, for submission to it always means renouncing one's wholeness and running away from the final consequences of one's own being.

298] To develop one's own personality is indeed an unpopular undertaking, a deviation that is highly uncongenial to the herd, an eccentricity smelling of the cenobite, as it seems to the outsider. Small wonder, then, that from earliest times only the chosen few have embarked upon this strange adventure. Had they all been fools, we could safely dismiss them as ἰδιῶται, mentally "private" persons who have no claim on our interest. But, unfortunately, these personalities are as a rule the legendary heroes of mankind, the very ones who are looked up to, loved, and worshipped, the true sons of God whose names perish not. They are the flower and the fruit, the ever fertile seeds of the tree of humanity. This allusion to historical personalities makes it abundantly clear why the development of personality is an ideal, and why the cry of individualism is an insult. Their greatness has never lain in their abject submission to convention, but, on the contrary, in their deliverance *from* convention. They towered up like mountain peaks above the mass that still clung to its collective fears, its beliefs, laws, and systems, and boldly chose their own way. To the man in the street it has always seemed miraculous that anyone should turn aside from the beaten track with its known destinations, and strike out on the steep and narrow path leading into the unknown. Hence it was always believed that such a man, if not actually crazy, was possessed by a daemon or a god; for the miracle of a man being able to act otherwise than as humanity has always acted could only be explained by the gift of daemonic power or divine spirit. How could anyone but a god counterbalance the dead weight of humanity in the mass, with its everlasting convention and habit? From the beginning, therefore, the heroes were endowed with godlike attributes. According to the Nordic view they had snake's eyes, and there was something peculiar about their birth or descent; certain heroes of ancient Greece were snake-souled, others had a personal daemon, were magicians or the elect of God. All these attributes, which could be multiplied at will, show that for the ordinary man the outstanding personality is something *supernatural*, a phenomenon that can only be explained by the intervention of some daemonic factor.

299] What is it, in the end, that induces a man to go his own way and to rise out of unconscious identity with the mass as out of a swathing mist? Not necessity, for necessity comes to many, and they all take refuge in convention. Not moral decision, for nine times out of ten we decide for convention likewise. What is it, then, that inexorably tips the scales in favour of the *extra-ordinary?*

300] It is what is commonly called *vocation:* an irrational factor that destines a man to emancipate himself from the herd and from its well-worn paths. True personality is always a vocation and puts its trust in it as in God, despite its being, as the ordinary man would say, only a personal feeling. But vocation acts like a law of God from which there is no escape. The fact that many a man who goes his own way ends in ruin means nothing to one who has a vocation. He *must* obey his own law, as if it were a daemon whispering to him of new and wonderful paths. Anyone with a vocation hears the voice of the inner man: he is *called*. That is why the legends say that he possesses a private daemon who counsels him and whose mandates he must obey. The best known example of this is Faust, and an historical instance is provided by the daemon of Socrates. Primitive medicine-men have their snake spirits, and Aesculapius, the tutelary patron of physicians, has for his emblem the Serpent of Epidaurus. He also had, as his private daemon, the Cabir Telesphoros, who is said to have dictated or inspired his medical prescriptions.

301] The original meaning of “to have a vocation” is “to be addressed by a voice.” The clearest examples of this are to be found in the avowals of the Old Testament prophets. That it is not just a quaint old-fashioned way of speaking is proved by the confessions of historical personalities such as Goethe and Napoleon, to mention only two familiar examples, who made no secret of their feeling of vocation.

302] Vocation, or the feeling of it, is not, however, the prerogative of great personalities; it is also appropriate to the small ones all the way down to the “midget” personalities, but as the size decreases the voice becomes more and more muffled and unconscious. It is as if the voice of the daemon within were moving further and further off, and spoke more rarely and more indistinctly. The smaller the personality, the dimmer and more unconscious it becomes, until finally it merges indistinguishably with the surrounding society, thus surrendering its own wholeness and dissolving into the wholeness of the group. In the place of the inner voice there is the voice of the group with its conventions, and vocation is replaced by collective necessities. But even in this unconscious social condition there are not a few who are called awake by the summons of the voice, whereupon they are at once set apart from the others, feeling themselves confronted with a problem about which the others know nothing. In most cases it is impossible to explain to the others what has happened, for any understanding is walled off by impenetrable prejudices. “You are no different from anybody else,” they will chorus, or, “there’s no such thing,” and even if there is such a thing, it is immediately branded as “morbid” and “most unseemly.” For it is “a monstrous presumption to suppose anything of that sort could be of the slightest significance”—it is “purely psychological.” This last objection is extremely popular nowadays. It stems from a curious underestimation of anything psychic, which people apparently regard as personal, arbitrary, and therefore completely futile. And this, paradoxically enough, despite their enthusiasm for psychology. The unconscious, after all, is “nothing but fantasy.” We “merely imagined” so and so, etc. People think themselves magicians who can conjure the psyche hither and thither and fashion it to suit their moods. They deny what strikes them as inconvenient, sublimate anything nasty, explain away their phobias, correct their faults, and feel in the end that they have arranged everything beautifully. In the meantime they have forgotten the essential point, which is that only the tiniest fraction of the psyche is identical with the conscious mind and its box of magic tricks, while for much the greater part it is sheer unconscious *fact*, hard and immitigable as granite, immovable, inaccessible, yet ready at any time to come crashing down upon us at the behest of unseen powers. The gigantic catastrophes that threaten us today are not elemental happenings of a physical or biological order, but psychic events. To a quite terrifying degree we are threatened by wars and revolutions which are nothing other than psychic epidemics. At any moment several millions of human beings may be smitten with a new madness, and then we shall have another world war or devastating revolution. Instead of being at the mercy of wild beasts, earthquakes, landslides, and inundations, modern man is battered by the elemental forces of his own psyche. This is the World Power that vastly exceeds all other powers on earth. The Age of Enlightenment, which stripped nature and human institutions of gods, overlooked the God of Terror who dwells in the human soul. If anywhere, fear of God is justified in face of the overwhelming supremacy of the psychic.

303] But all this is so much abstraction. Everyone knows that the intellect, that clever jackanapes, can put it this way or any other way he pleases. It is a very different thing when the psyche, as an objective fact, hard as granite and heavy as lead, confronts a man as an inner experience and addresses him in an audible voice, saying, “This is what will and must be.” Then he feels himself called, just as the group does when there’s a war on, or a revolution, or any other madness. It is not for nothing that our age calls for the redeemer personality, for the one who can emancipate himself from the inescapable grip of the collective and save at least his own soul, who lights a beacon of hope for others, proclaiming that here is at least *one* man who has succeeded in extricating himself from that fatal identity with the group psyche. For the group, because of its unconsciousness, has no freedom of choice, and so psychic activity runs on in it like an uncontrolled law of nature. There is thus set going a chain reaction that comes to a stop only in catastrophe. The people always long for a hero, a slayer of dragons, when they feel the danger of psychic forces; hence the cry for personality.

304] But what has the individual personality to do with the plight of the many? In the first place he is part of the people as a whole, and is as much at the mercy of the power that moves the whole as anybody else. The only thing that distinguishes him from all the others is his vocation. He has been called by that all-powerful, all-tyrannizing psychic necessity that is his own and his people's affliction. If he hearkens to the voice, he is at once set apart and isolated, as he has resolved to obey the law that commands him from within. "His *own* law!" everybody will cry. But he knows better: it is *the* law, *the* vocation for which he is destined, no more "his own" than the lion that fells him, although it is undoubtedly this particular lion that kills him and not any other lion. Only in this sense is he entitled to speak of "his" vocation, "his" law.

305] With the decision to put his way above all other possible ways he has already fulfilled the greater part of his vocation as a redeemer. He has invalidated all other ways for himself, exalting his law above convention and thus making a clean sweep of all those things that not only failed to prevent the great danger but actually accelerated it. For conventions in themselves are soulless mechanisms that can never understand more than the mere routine of life. Creative life always stands outside convention. That is why, when the mere routine of life predominates in the form of convention and tradition, there is bound to be a destructive outbreak of creative energy. This outbreak is a catastrophe only when it is a mass phenomenon, but never in the individual who consciously submits to these higher powers and serves them with all his strength. The mechanism of convention keeps people unconscious, for in that state they can follow their accustomed tracks like blind brutes, without the need for conscious decision. This unintended result of even the best conventions is unavoidable but is no less a terrible danger for that. For when new conditions arise that are not provided for under the old conventions, then, just as with animals, panic is liable to break out among human beings kept unconscious by routine, and with equally unpredictable results.

306] Personality, however, does not allow itself to be seized by the panic terror of those who are just waking to consciousness, for it has put all its terrors behind it. It is able to cope with the changing times, and has unknowingly and involuntarily become a *leader*.

307] All human beings are much alike, otherwise they could not succumb to the same delusion, and the psychic substratum upon which the individual consciousness is based is universally the same, otherwise people could never reach a common understanding. So, in this sense, personality and its peculiar psychic make-up are not something absolutely unique. The uniqueness holds only for the *individual* nature of the personality, as it does for each and every individual. To become a personality is not the absolute prerogative of the genius, for a man may be a genius without being a personality. In so far as every individual has the law of his life inborn in him, it is theoretically possible for any man to follow this law and so become a personality, that is, to achieve wholeness. But since life only exists in the form of living units, i.e., individuals, the law of life always tends towards a life individually lived. So although the objective psyche can only be conceived as a universal and uniform datum, which means that all men share the same primary, psychic condition, this objective psyche must nevertheless individuate itself if it is to become actualized, for there is no other way in which it could express itself except through the individual human being. The only exception to this is when it seizes hold of a group, in which case it must, of its own nature, precipitate a catastrophe, because it can only operate unconsciously and is not assimilated by any consciousness or assigned its place among the existing conditions of life.

308] Only the man who can consciously assent to the power of the inner voice becomes a personality; but if he succumbs to it he will be swept away by the blind flux of psychic events and destroyed. That is the great and liberating thing about any genuine personality: he voluntarily sacrifices himself to his vocation, and consciously translates into his own individual reality what would only lead to ruin if it were lived unconsciously by the group.

309] One of the most shining examples of the meaning of personality that history has preserved for us is the life of Christ. In Christianity, which, be it mentioned in passing, was the only religion really persecuted by the Romans, there rose up a direct opponent of the Caesarean madness that afflicted not only the emperor, but every Roman as well: *civis Romanus sum*. The opposition showed itself wherever the worship of Caesar clashed with Christianity. But, as we know from what the evangelists tell us about the psychic development of Christ's personality, this opposition was fought out just as decisively in the soul of its founder. The story of the Temptation clearly reveals the nature of the psychic power with which Jesus came into collision: it was the power-intoxicated devil of the prevailing Caesarean psychology that led him into dire temptation in the wilderness. This devil was the objective psyche that held all the peoples of the Roman Empire under its sway, and that is why it promised Jesus all the kingdoms of the earth, as if it were trying to make a Caesar of him. Obeying the inner call of his vocation, Jesus voluntarily exposed himself to the assaults of the imperialistic madness that filled everyone, conqueror and conquered alike. In this way he recognized the nature of the objective psyche which had plunged the whole world into misery and had begotten a yearning for salvation that found expression even in the pagan poets. Far from suppressing or allowing himself to be suppressed by this psychic onslaught, he let it act on him consciously, and assimilated it. Thus was world-conquering Caesarism transformed into spiritual kingship, and the Roman Empire into the universal kingdom of God that was not of this world. While the whole Jewish nation was expecting an imperialistically minded and politically active hero as a Messiah, Jesus fulfilled the Messianic mission not so much for his own nation as for the whole Roman world, and pointed out to humanity the old truth that where force rules there is no love, and where love reigns force does not count. The religion of love was the exact psychological counterpart to the Roman devil-worship of power.

310] The example of Christianity is perhaps the best illustration of my previous abstract argument. This apparently unique life became a sacred symbol because it is the psychological prototype of the only meaningful life, that is, of a life that strives for the individual realization—absolute and unconditional—of its own particular law. Well may we exclaim with Tertullian; *anima naturaliter christiana!*

311] The deification of Jesus, as also of the Buddha, is not surprising, for it affords a striking example of the enormous valuation that humanity places upon these hero figures and hence upon the ideal of personality. Though it seems at present as if the blind and destructive dominance of meaningless collective forces would thrust the ideal of personality into the background, yet this is only a passing revolt against the dead weight of history. Once the revolutionary, unhistorical, and therefore uneducated inclinations of the rising generation have had their fill of tearing-down tradition, new heroes will be sought and found. Even the Bolsheviks, whose radicalism leaves nothing to be desired, have embalmed Lenin and made a saviour of Karl Marx. The ideal of personality is one of the ineradicable needs of the human soul, and the more unsuitable it is the more fanatically it is defended. Indeed, the worship of Caesar was itself a misconceived cult of personality, and modern Protestantism, whose critical theology has reduced the divinity of Christ to vanishing point, has found its last refuge in the personality of Jesus.

312] Yes, this thing we call personality is a great and mysterious problem. Everything that can be said about it is curiously unsatisfactory and inadequate, and there is always a danger of the discussion losing itself in pomposity and empty chatter. The very idea of personality is, in common usage, so vague and ill-defined that one hardly ever finds two people who take the word in the same sense. If I put forward a more definite conception of it, I do not imagine that I have uttered the last word. I should like to regard all I say here only as a tentative attempt to approach the problem of personality without making any claim to solve it. Or rather, I should like my attempt to be regarded as a description of the psychological problems raised by personality. All the usual explanations and nostrums of psychology are apt to fall short here, just as they do with the man of genius or the creative artist. Inferences from heredity or from environment do not quite come off; inventing fictions about childhood, so popular today, ends—to put it mildly—in unreality; explanations from necessity—“he had no money,” “he was a sick man,” etc.—remain caught in externals. There is always something irrational to be added, something that simply cannot be explained, a *deus ex machina* or an *asylum ignorantiae*, that well-known sobriquet for God. The problem thus seems to border on the extrahuman realm, which has always been known by a divine name. As you can see, I too have had to refer to the “inner voice,” the vocation, and define it as a powerful objective-psychic factor in order to characterize the way in which it functions in the developing personality and how it appears subjectively.

Mephistopheles, in *Faust*, is not personified merely because this creates a better dramatic or theatrical effect, as though Faust were his own moralist and painted his private devil on the wall. The opening words of the Dedication—“Once more you hover near me, forms and faces”—are more than just an aesthetic flourish. Like the concretism of the devil, they are an admission of the objectivity of psychic experience, a whispered avowal that this was what *actually happened*, not because of subjective wishes, or fears, or personal opinions, but somehow quite of itself. Naturally only a numskull thinks of ghosts, but something like a primitive numskull seems to lurk beneath the surface of our reasonable daytime consciousness.

313] Hence the eternal doubt whether what appears to be the objective psyche is really objective, or whether it might not be imagination after all. But then the question at once arises: have I imagined such and such a thing on purpose, or has it been imagined by something in me? It is a similar problem to that of the neurotic who suffers from an imaginary carcinoma. He knows, and has been told a hundred times before, that it is all imagination, and yet he asks me brokenly, “But why do I imagine such a thing? I don’t want to do it!” To which the answer is: the idea of the carcinoma has imagined itself in him without his knowledge and without his consent. The reason is that a psychic growth, a “proliferation,” is taking place in his unconscious without his being able to make it conscious. In the face of this interior activity he feels afraid. But since he is entirely persuaded that there can be nothing in his own soul that he does not know about, he must relate his fear to a physical carcinoma which he knows does not exist. And if he should still be afraid of it, there are a hundred doctors to convince him that his fear is entirely groundless. The neurosis is thus a defence against the objective, inner activity of the psyche, or an attempt, somewhat dearly paid for, to escape from the inner voice and hence from the vocation. For this “growth” is the objective activity of the psyche, which, independently of conscious volition, is trying to speak to the conscious mind through the inner voice and lead him towards wholeness. Behind the neurotic perversion is concealed his vocation, his destiny: the growth of personality, the full realization of the life-will that is born with the individual. It is the man without *amor fati* who is the neurotic; he, truly, has missed his vocation, and never will he be able to say with Cromwell, “None climbeth so high as he who knoweth not whither his destiny leadeth him.”[5]

314] To the extent that a man is untrue to the law of his being and does not rise to personality, he has failed to realize his life’s meaning. Fortunately, in her kindness and patience, Nature never puts the fatal question as to the meaning of their lives into the mouths of most people. And where no one asks, no one need answer.

315] The neurotic’s fear of carcinoma is therefore justified: it is not imagination, but the consistent expression of a psychic fact that exists in a sphere outside consciousness, beyond the reach of his will and understanding. If he withdrew into the wilderness and listened to his inner life in solitude, he might perhaps hear what the voice has to say. But as a rule the miseducated, civilized human being is quite incapable of perceiving the voice, which is something not guaranteed by the current shibboleths. Primitive people have a far greater capacity in this respect; at least the medicine-men are able, as part of their professional equipment, to talk with spirits, trees, and animals, these being the forms in which they encounter the objective psyche or psychic non-ego.

316] Because neurosis is a developmental disturbance of the personality, we physicians of the soul are compelled by professional necessity to concern ourselves with the problem of personality and the inner voice, however remote it may seem to be. In practical psychotherapy these psychic facts, which are usually so vague and have so often degenerated into empty phrases, emerge from obscurity and take visible shape. Nevertheless, it is extremely rare for this to happen spontaneously as it did with the Old Testament prophets; generally the psychic conditions that have caused the disturbance have to be made conscious with considerable effort. But the contents that then come to light are wholly in accord with the inner voice and point to a predestined vocation, which, if accepted and assimilated by the conscious mind, conduces to the development of personality.

317] Just as the great personality acts upon society to liberate, to redeem, to transform, and to heal, so the birth of personality in oneself has a therapeutic effect. It is as if a river that had run to waste in sluggish side-streams and marshes suddenly found its way back to its proper bed, or as if a stone lying on a germinating seed were lifted away so that the shoot could begin its natural growth.

318] The inner voice is the voice of a fuller life, of a wider, more comprehensive consciousness. That is why, in mythology, the birth of the hero or the symbolic rebirth coincides with sunrise, for the growth of personality is synonymous with an increase of self-consciousness. For the same reason most heroes are characterized by solar attributes, and the moment of birth of their greater personality is known as illumination.

319] The fear that most people naturally have of the inner voice is not so childish as might be supposed. The contents that rise up and confront a limited consciousness are far from harmless, as is shown by the classic example of the temptation of Christ, or the equally significant Mara episode in the Buddha legend. As a rule, they signify the specific danger to which the person concerned is liable to succumb. What the inner voice whispers to us is generally something negative, if not actually evil. This must be so, first of all because we are usually not as unconscious of our virtues as of our vices, and then because we suffer less from the good than from the bad in us. The inner voice, as I have explained above, makes us conscious of the evil from which the whole community is suffering, whether it be the nation or the whole human race. But it presents this evil in an individual form, so that one might at first suppose it to be only an individual characteristic. The inner voice brings the evil before us in a very tempting and convincing way in order to make us succumb. If we do not partially succumb, nothing of this apparent evil enters into us, and no regeneration or healing can take place. (I say “apparent,” though this may sound too optimistic.) If we succumb completely, then the contents expressed by the inner voice act as so many devils, and a catastrophe ensues. But if we can succumb only in part, and if by self-assertion the ego can save itself from being completely swallowed, then it can assimilate the voice, and we realize that the evil was, after all, only a semblance of evil, but in reality a bringer of healing and illumination. In fact, the inner voice is a

"Lucifer" in the strictest and most unequivocal sense of the word, and it faces people with ultimate moral decisions without which they can never achieve full consciousness and become personalities. The highest and the lowest, the best and the vilest, the truest and the most deceptive things are often blended together in the inner voice in the most baffling way, thus opening up in us an abyss of confusion, falsehood, and despair.

320] It is naturally absurd for people to accuse the voice of Nature, the all-sustainer and all-destroyer, of evil. If she appears inveterately evil to us, this is mainly due to the old truth that the good is always the enemy of the better. We would be foolish indeed if we did not cling to the traditional good for as long as possible. But as Faust says:

> Whenever in this world we reach the good
> We call the better all a lie, a sham!

A good thing is unfortunately not a good forever, for otherwise there would be nothing better. If better is to come, good must stand aside. Therefore Meister Eckhart says, "God is not good, or else he could be better."

321] There are times in the world's history—and our own time may be one of them—when good must stand aside, so that anything destined to be better first appears in evil form. This shows how extremely dangerous it is even to touch these problems, for evil can so easily slip in on the plea that it is, potentially, the better The problems of the inner voice are full of pitfalls and hidden snares. Treacherous, slippery ground, as dangerous and pathless as life itself once one lets go of the railings. But he who cannot lose his life, neither shall he save it. The hero's birth and the heroic life are always threatened. The serpents sent by Hera to destroy the infant Hercules, the python that tries to strangle Apollo at birth, the massacre of the innocents, all these tell the same story. To develop the personality is a gamble, and the tragedy is that the daemon of the inner voice is at once our greatest danger and an indispensable help. It is tragic, but logical, for it is the nature of things to be so.

322] Can we, therefore, blame humanity, and all the well-meaning shepherds of the flock and worried fathers of families, if they erect protective barriers, hold up wonder-working images, and point out the roads that wind safely past the abyss?

323] But, in the end, the hero, the leader, the saviour, is one who discovers a new way to greater certainty. Everything could be left undisturbed did not the new way demand to be discovered, and did it not visit humanity with all the plagues of Egypt until it finally is discovered. The undiscovered vein within us is a living part of the psyche; classical Chinese philosophy names this interior way “Tao,” and likens it to a flow of water that moves irresistibly towards its goal. To rest in Tao means fulfilment, wholeness, one’s destination reached, one’s mission done; the beginning, end, and perfect realization of the meaning of existence innate in all things. Personality is Tao.

VIII

MARRIAGE AS A PSYCHOLOGICAL RELATIONSHIP

MARRIAGE AS A PSYCHOLOGICAL RELATIONSHIP[1]

324] Regarded as a psychological relationship, marriage is a highly complex structure made up of a whole series of subjective and objective factors, mostly of a very heterogeneous nature. As I wish to confine myself here to the purely psychological problems of marriage, I must disregard in the main the objective factors of a legal and social nature, although these cannot fail to have a pronounced influence on the psychological relationship between the marriage partners.

325] Whenever we speak of a “psychological relationship” we presuppose one that is *conscious*, for there is no such thing as a psychological relationship between two people who are in a state of unconsciousness. From the psychological point of view they would be wholly without relationship. From any other point of view, the physiological for example, they could be regarded as related, but one could not call their relationship psychological. It must be admitted that though such total unconsciousness as I have assumed does not occur, there is nevertheless a not inconsiderable degree of partial unconsciousness, and the psychological relationship is limited in the degree to which that unconsciousness exists.

326] In the child, consciousness rises out of the depths of unconscious psychic life, at first like separate islands, which gradually unite to form a “continent,” a continuous land-mass of consciousness. Progressive mental development means, in effect, extension of consciousness. With the rise of a continuous consciousness, and not before, psychological relationship becomes possible. So far as we know, consciousness is always ego-consciousness. In order to be conscious of myself, I must be able to distinguish myself from others. Relationship can only take place where this distinction exists. But although the distinction may be made in a general way, normally it is incomplete, because large areas of psychic life still remain unconscious. As no distinction can be made with regard to unconscious contents, on this terrain no relationship can be established; here there still reigns the original unconscious condition of the ego's primitive identity with others, in other words a complete absence of relationship.

327] The young person of marriageable age does, of course, possess an ego-consciousness (girls more than men, as a rule), but, since he has only recently emerged from the mists of original unconsciousness, he is certain to have wide areas which still lie in the shadow and which preclude to that extent the formation of psychological relationship. This means, in practice, that the young man (or woman) can have only an incomplete understanding of himself and others, and is therefore imperfectly informed as to his, and their, motives. As a rule the motives he acts from are largely unconscious. Subjectively, of course, he thinks himself very conscious and knowing, for we constantly overestimate the existing content of consciousness, and it is a great and surprising discovery when we find that what we had supposed to be the final peak is nothing but the first step in a very long climb. The greater the area of unconsciousness, the less is marriage a matter of free choice, as is shown subjectively in the fatal compulsion one feels so acutely when one is in love. The compulsion can exist even when one is not in love, though in less agreeable form.

328] Unconscious motivations are of a personal and of a general nature. First of all, there are the motives deriving from parental influence. The relationship of the young man to his mother, and of the girl to her father, is the determining factor in this respect. It is the strength of the bond to the parents that unconsciously influences the choice of husband or wife, either positively or negatively. Conscious love for either parent favours the choice of a like mate, while an unconscious tie (which need not by any means express itself consciously as love) makes the choice difficult and imposes characteristic modifications. In order to understand them, one must know first of all the cause of the unconscious tie to the parents, and under what conditions it forcibly modifies, or even prevents, the conscious choice. Generally speaking, all the life which the parents could have lived, but of which they thwarted themselves for artificial motives, is passed on to the children in substitute form. That is to say, the children are driven unconsciously in a direction that is intended to compensate for everything that was left unfulfilled in the lives of their parents. Hence it is that excessively moral-minded parents have what are called “unmoral” children, or an irresponsible wastrel of a father has a son with a positively morbid amount of ambition, and so on. The worst results flow from parents who have kept themselves artificially unconscious. Take the case of a mother who deliberately keeps herself unconscious so as not to disturb the pretence of a “satisfactory” marriage. Unconsciously she will bind her son to her, more or less as a substitute for a husband. The son, if not forced directly into homosexuality, is compelled to modify his choice in a way that is contrary to his true nature. He may, for instance, marry a girl who is obviously inferior to his mother and therefore unable to compete with her; or he will fall for a woman of a tyrannical and overbearing disposition, who may perhaps succeed in tearing him away from his mother. The choice of a mate, if the instincts have not been vitiated, may remain free from these influences, but sooner or later they will make themselves felt as obstacles. A more or less instinctive choice might be considered the best from the point of view of maintaining the species, but it is not always fortunate psychologically, because there is often an uncommonly large difference between the purely instinctive personality and one that is individually differentiated. And though in such cases the race might be improved and invigorated by a purely instinctive choice, individual happiness would be bound to suffer. (The idea of “instinct” is of course nothing more than a collective term for all kinds of organic and psychic factors whose nature is for the most part unknown.)

329] If the individual is to be regarded solely as an instrument for maintaining the species, then the purely instinctive choice of a mate is by far the best. But since the foundations of such a choice are unconscious, only a kind of impersonal liaison can be built upon them, such as can be observed to perfection among primitives. If we can speak here of a “relationship” at all, it is, at best, only a pale reflection of what we mean, a very distant state of affairs with a decidedly impersonal character, wholly regulated by traditional customs and prejudices, the prototype of every conventional marriage.

330] So far as reason or calculation or the so-called loving care of the parents does not arrange the marriage, and the pristine instincts of the children are not vitiated either by false education or by the hidden influence of accumulated and neglected parental complexes, the marriage choice will normally follow the unconscious motivations of instinct. Unconsciousness results in non-differentiation, or unconscious identity. The practical consequence of this is that one person presupposes in the other a psychological structure similar to his own. Normal sex life, as a shared experience with apparently similar aims, further strengthens the feeling of unity and identity. This state is described as one of complete harmony, and is extolled as a great happiness ("one heart and one soul")—not without good reason, since the return to that original condition of unconscious oneness is like a return to childhood. Hence the childish gestures of all lovers. Even more is it a return to the mother's womb, into the teeming depths of an as yet unconscious creativity. It is, in truth, a genuine and incontestable experience of the Divine, whose transcendent force obliterates and consumes everything individual; a real communion with life and the impersonal power of fate. The individual will for self-possession is broken: the woman becomes the mother, the man the father, and thus both are robbed of their freedom and made instruments of the life urge.

331] Here the relationship remains within the bounds of the biological instinctive goal, the preservation of the species. Since this goal is of a collective nature, the psychological link between husband and wife will also be essentially collective, and cannot be regarded as an individual relationship in the psychological sense. We can only speak of this when the nature of the unconscious motivations has been recognized and the original identity broken down. Seldom or never does a marriage develop into an individual relationship smoothly and without crises. There is no birth of consciousness without pain.

331a] The ways that lead to conscious realization are many, but they follow definite laws. In general, the change begins with the onset of the second half of life. The middle period of life is a time of enormous psychological importance. The child begins its psychological life within very narrow limits, inside the magic circle of the mother and the family.

With progressive maturation it widens its horizon and its own sphere of influence; its hopes and intentions are directed to extending the scope of personal power and possessions; desire reaches out to the world in ever-widening range; the will of the individual becomes more and more identical with the natural goals pursued by unconscious motivations. Thus man breathes his own life into things, until finally they begin to live of themselves and to multiply; and imperceptibly he is overgrown by them. Mothers are overtaken by their children, men by their own creations, and what was originally brought into being only with labour and the greatest effort can no longer be held in check. First it was passion, then it became duty, and finally an intolerable burden, a vampire that battens on the life of its creator. Middle life is the moment of greatest unfolding, when a man still gives himself to his work with his whole strength and his whole will. But in this very moment evening is born, and the second half of life begins. Passion now changes her face and is called duty; “I want” becomes the inexorable “I must,” and the turnings of the pathway that once brought surprise and discovery become dulled by custom. The wine has fermented and begins to settle and clear. Conservative tendencies develop if all goes well; instead of looking forward one looks backward, most of the time involuntarily, and one begins to take stock, to see how one’s life has developed up to this point. The real motivations are sought and real discoveries are made. The critical survey of himself and his fate enables a man to recognize his peculiarities. But these insights do not come to him easily; they are gained only through the severest shocks.

331b] Since the aims of the second half of life are different from those of the first, to linger too long in the youthful attitude produces a division of the will. Consciousness still presses forward, in obedience, as it were, to its own inertia, but the unconscious lags behind, because the strength and inner resolve needed for further expansion have been sapped. This disunity with oneself begets discontent, and since one is not conscious of the real state of things one generally projects the reasons for it upon one’s partner. A critical atmosphere thus develops, the necessary prelude to conscious realization. Usually this state does not begin simultaneously for both partners. Even the best of marriages cannot expunge individual differences so completely that the state of mind of the partners is absolutely identical. In most cases one of them will adapt to marriage more quickly than the other. The one who is grounded on a positive relationship to the parents will find little or no difficulty in adjusting to his or her partner, while the other may be hindered by a deep-seated unconscious tie to the parents. He will therefore achieve complete adaptation only later, and, because it is won with greater difficulty, it may even prove the more durable.

331c] These differences in tempo, and in the degree of spiritual development, are the chief causes of a typical difficulty which makes its appearance at critical moments. In speaking of "the degree of spiritual development" of a personality, I do not wish to imply an especially rich or magnanimous nature. Such is not the case at all. I mean, rather, a certain complexity of mind or nature, comparable to a gem with many facets as opposed to the simple cube. There are many-sided and rather problematical natures burdened with hereditary traits that are sometimes very difficult to reconcile. Adaptation to such natures, or their adaptation to simpler personalities, is always a problem. These people, having a certain tendency to dissociation, generally have the capacity to split off irreconcilable traits of character for considerable periods, thus passing themselves off as much simpler than they are; or it may happen that their many-sidedness, their very versatility, lends them a peculiar charm. Their partners can easily lose themselves in such a labyrinthine nature, finding in it such an abundance of possible experiences that their personal interests are completely absorbed, sometimes in a not very agreeable way, since their sole occupation then consists in tracking the other through all the twists and turns of his character. There is always so much experience available that the simpler personality is surrounded, if not actually swamped, by it; he is swallowed up in his more complex partner and cannot see his way out. It is an almost regular occurrence for a woman to be wholly contained, spiritually, in her husband, and for a husband to be wholly contained, emotionally, in his wife. One could describe this as the problem of the "contained" and the "container."

332] The one who is contained feels himself to be living entirely within the confines of his marriage; his attitude to the marriage partner is undivided; outside the marriage there exist no essential obligations and no binding interests. The unpleasant side of this otherwise ideal partnership is the disquieting dependence upon a personality that can never be seen in its entirety, and is therefore not altogether credible or dependable. The great advantage lies in his own undividedness, and this is a factor not to be underrated in the psychic economy.

333] The container, on the other hand, who in accordance with his tendency to dissociation has an especial need to unify himself in undivided love for another, will be left far behind in this effort, which is naturally very difficult for him, by the simpler personality. While he is seeking in the latter all the subtleties and complexities that would complement and correspond to his own facets, he is disturbing the other's simplicity. Since in normal circumstances simplicity always has the advantage over complexity, he will very soon be obliged to abandon his efforts to arouse subtle and intricate reactions in a simpler nature. And soon enough his partner, who in accordance with her[2] simpler nature expects simple answers from him, will give him plenty to do by constellating his complexities with her everlasting insistence on simple answers. Willynilly, he must withdraw into himself before the suasions of simplicity. Any mental effort, like the conscious process itself, is so much of a strain for the ordinary man that he invariably prefers the simple, even when it does not happen to be the truth. And when it represents at least a half-truth, then it is all up with him. The simpler nature works on the more complicated like a room that is too small, that does not allow him enough space. The complicated nature, on the other hand, gives the simpler one too many rooms with too much space, so that she never knows where she really belongs. So it comes about quite naturally that the more complicated contains the simpler. The former cannot be absorbed in the latter, but encompasses it without being itself contained. Yet, since the more complicated has perhaps a greater need of being contained than the other, he feels himself outside the marriage and accordingly always plays the problematical role. The more the contained clings, the more the container feels shut out of the relationship. The contained pushes into it by her clinging, and the more she pushes, the less the container is able to respond. He therefore tends to spy out of the window, no doubt unconsciously at first; but with the onset of middle age there awakens in him a more insistent longing for that unity and undividedness which is especially necessary to him on account of his dissociated nature. At this juncture things are apt to occur that bring the conflict to a head. He becomes conscious of the fact that he is seeking completion, seeking the contentedness and undividedness that have always been lacking. For the contained this is only a confirmation of the insecurity she has always felt so painfully; she discovers that in the rooms which apparently belonged to her there dwell other, unwished-for guests. The hope of security vanishes, and this disappointment drives her in on herself, unless by desperate and violent efforts she can succeed in forcing her partner to capitulate, and in extorting a confession that his longing for unity was nothing but a childish or morbid fantasy. If these tactics do not succeed, her acceptance of failure may do her a real good, by forcing her to recognize that the security she was so desperately seeking in the other is to be found in herself. In this way she finds herself and discovers in her own simpler nature all those complexities which the container had sought for in vain.

334] If the container does not break down in face of what we are wont to call “unfaithfulness,” but goes on believing in the inner justification of his longing for unity, he will have to put up with his self-division for the time being. A dissociation is not healed by being split off, but by more complete disintegration. All the powers that strive for unity, all healthy desire for selfhood, will resist the disintegration, and in this way he will become conscious of the possibility of an inner integration, which before he had always sought outside himself. He will then find his reward in an undivided self.

335] This is what happens very frequently about the midday of life, and in this wise our miraculous human nature enforces the transition that leads from the first half of life to the second. It is a metamorphosis from a state in which man is only a tool of instinctive nature, to another in which he is no longer a tool, but himself: a transformation of nature into culture, of instinct into spirit.

336] One should take great care not to interrupt this necessary development by acts of moral violence, for any attempt to create a spiritual attitude by splitting off and suppressing the instincts is a falsification. Nothing is more repulsive than a furtively prurient spirituality; it is just as unsavoury as gross sensuality. But the transition takes a long time, and the great majority of people get stuck in the first stages. If only we could, like the primitives, leave the unconscious to look after this whole psychological development which marriage entails, these transformations could be worked out more completely and without too much friction. So often among so-called "primitives" one comes across spiritual personalities who immediately inspire respect, as though they were the fully matured products of an undisturbed fate. I speak here from personal experience. But where among present-day Europeans can one find people not deformed by acts of moral violence? We are still barbarous enough to believe both in asceticism and its opposite. But the wheel of history cannot be put back; we can only strive towards an attitude that will allow us to live out our fate as undisturbedly as the primitive pagan in us really wants. Only on this condition can we be sure of not perverting spirituality into sensuality, and vice versa; for both must live, each drawing life from the other.

337] The transformation I have briefly described above is the very essence of the psychological marriage relationship. Much could be said about the illusions that serve the ends of nature and bring about the transformations that are characteristic of middle life. The peculiar harmony that characterizes marriage during the first half of life—provided the adjustment is successful—is largely based on the projection of certain archetypal images, as the critical phase makes clear.

338] Every man carries within him the eternal image of woman, not the image of this or that particular woman, but a definite feminine image. This image is fundamentally unconscious, an hereditary factor of primordial origin engraved in the living organic system of the man, an imprint or "archetype" of all the ancestral experiences of the female, a deposit, as it were, of all the impressions ever made by woman—in short, an inherited system of psychic adaptation. Even if no women existed, it would still be possible, at any given time, to deduce from this unconscious image exactly how a woman would have to be constituted psychically. The same is true of the woman: she too has her inborn image of man. Actually, we know from experience that it would be more accurate to describe it as an image of *men*, whereas in the case of the man it is rather the image of *woman*. Since this image is unconscious, it is always unconsciously projected upon the person of the beloved, and is one of the chief reasons for passionate attraction or aversion. I have called this image the "anima," and I find the scholastic question *Habet mulier animam?* especially interesting, since in my view it is an intelligent one inasmuch as the doubt seems justified. Woman has no anima, no soul, but she has an *animus*. The anima has an erotic, emotional character, the animus a rationalizing one. Hence most of what men say about feminine eroticism, and particularly about the emotional life of women, is derived from their own anima projections and distorted accordingly. On the other hand, the astonishing assumptions and fantasies that women make about men come from the activity of the animus, who produces an inexhaustible supply of illogical arguments and false explanations.

339] Anima and animus are both characterized by an extraordinary many-sidedness. In a marriage it is always the contained who projects this image upon the container, while the latter is only partially able to project his unconscious image upon his partner. The more unified and simple this partner is, the less complete the projection. In which case, this highly fascinating image hangs as it were in mid air, as though waiting to be filled out by a living person. There are certain types of women who seem to be made by nature to attract anima projections; indeed one could almost speak of a definite "anima type." The so-called "sphinx-like" character is an indispensable part of their equipment, also an equivocalness, an intriguing elusiveness—not an indefinite blur that offers nothing, but an indefiniteness that seems full of promises, like the speaking silence of a Mona Lisa. A woman of this kind is both old and young, mother and daughter, of more than doubtful chastity, childlike, and yet endowed with a naïve cunning that is extremely disarming to men.[3] Not every man of real intellectual power can be an animus, for the animus must be a master not so much of fine ideas as of fine words—words seemingly full of meaning which purport to leave a great deal unsaid. He must also belong to the "misunderstood" class, or be in some way at odds with his environment, so that the idea of self-sacrifice can insinuate itself. He must be a rather questionable hero, a man with possibilities, which is not to say that an animus projection may not discover a real hero long before he has become perceptible to the sluggish wits of the man of "average intelligence."[4]

340] For man as well as for woman, in so far as they are "containers," the filling out of this image is an experience fraught with consequences, for it holds the possibility of finding one's own complexities answered by a corresponding diversity. Wide vistas seem to open up in which one feels oneself embraced and contained. I say "seem" advisedly, because the experience may be two-faced. Just as the animus projection of a woman can often pick on a man of real significance who is not recognized by the mass, and can actually help him to achieve his true destiny with her moral support, so a man can create for himself a *femme inspiratrice* by his anima projection. But more often it turns out to be an illusion with destructive consequences, a failure because his faith was not sufficiently strong. To the pessimists I would say that these primordial psychic images have an extraordinarily positive value, but I must warn the optimists against blinding fantasies and the likelihood of the most absurd aberrations.

341] One should on no account take this projection for an individual and conscious relationship. In its first stages it is far from that, for it creates a compulsive dependence based on unconscious motives other than the biological ones. Rider Haggard's *She* gives some indication of the curious world of ideas that underlies the anima projection. They are in essence spiritual contents, often in erotic disguise, obvious fragments of a primitive mythological mentality that consists of archetypes, and whose totality constitutes the collective unconscious. Accordingly, such a relationship is at bottom collective and not individual. (Benoît, who created in *L'Atlantide* a fantasy figure similar even in details to "She," denies having plagiarized Rider Haggard.)

342] If such a projection fastens on to one of the marriage partners, a collective spiritual relationship conflicts with the collective biological one and produces in the container the division or disintegration I have described above. If he is able to hold his head above water, he will find himself through this very conflict. In that case the projection, though dangerous in itself, will have helped him to pass from a collective to an individual relationship. This amounts to full conscious realization of the relationship that marriage brings. Since the aim of this paper is a discussion of the psychology of marriage, the psychology of projection cannot concern us here. It is sufficient to mention it as a fact.

343] One can hardly deal with the psychological marriage relationship without mentioning, even at the risk of misunderstanding, the nature of its critical transitions. As is well known, one understands nothing psychological unless one has experienced it oneself. Not that this ever prevents anyone from feeling convinced that his own judgment is the only true and competent one. This disconcerting fact comes from the necessary overvaluation of the momentary content of consciousness, for without this concentration of attention one could not be conscious at all. Thus it is that every period of life has its own psychological truth, and the same applies to every stage of psychological development. There are even stages which only the few can reach, it being a question of race, family, education, talent, and passion. Nature is aristocratic. The normal man is a fiction, although certain generally valid laws do exist. Psychic life is a development that can easily be arrested on the lowest levels. It is as though every individual had a specific gravity, in accordance with which he either rises, or sinks down, to the level where he reaches his limit. His views and convictions will be determined accordingly. No wonder, then, that by far the greater number of marriages reach their upper psychological limit in fulfilment of the biological aim, without injury to spiritual or moral health. Relatively few people fall into deeper disharmony with themselves. Where there is a great deal of pressure from outside, the conflict is unable to develop much dramatic tension for sheer lack of energy. Psychological insecurity, however, increases in proportion to social security, unconsciously at first, causing neuroses, then consciously, bringing with it separations, discord, divorces, and other marital disorders. On still higher levels, new possibilities of psychological development are discerned, touching on the sphere of religion where critical judgment comes to a halt.

344] Progress may be permanently arrested on any of these levels, with complete unconsciousness of what might have followed at the next stage of development. As a rule graduation to the next stage is barred by violent prejudices and superstitious fears. This, however, serves a most useful purpose, since a man who is compelled by accident to live at a level too high for him becomes a fool and a menace.

345] Nature is not only aristocratic, she is also esoteric. Yet no man of understanding will thereby be induced to make a secret of what he knows, for he realizes only too well that the secret of psychic development can never be betrayed, simply because that development is a question of individual capacity.

INDEX

THE COLLECTED WORKS OF

C. G. JUNG

T*HE PUBLICATION of the first complete edition, in English*, of the works of C. G. Jung was undertaken by Routledge and Kegan Paul, Ltd., in England and by Bollingen Foundation in the United States. The American edition is number XX in Bollingen Series, which since 1967 has been published by Princeton University Press. The edition contains revised versions of works previously published, such as *Psychology of the Unconscious*, which is now entitled *Symbols of Transformation;* works originally written in English, such as *Psychology and Religion;* works not previously translated, such as *Aion;* and, in general, new translations of virtually all of Professor Jung's writings. Prior to his death, in 1961, the author supervised the textual revision, which in some cases is extensive. Sir Herbert Read (d. 1968), Dr. Michael Fordham, and Dr. Gerhard Adler compose the Editorial Committee; the translator is R. F. C. Hull (except for Volume 2) and William McGuire is executive editor.

The price of the volumes varies according to size; they are sold separately, and may also be obtained on standing order. Several of the volumes are extensively illustrated. Each volume contains an index and in *most* a bibliography; the final volumes will contain a complete bibliography of Professor Jung's writings and a general index to the entire edition.

In the following list, dates of original publication are given in parentheses (of original composition, in brackets). Multiple dates indicate revisions.

•1. PSYCHIATRIC STUDIES

On the Psychology and Pathology of So-Called Occult Phenomena (1902)

On Hysterical Misreading (1904)
Cryptomnesia (1905)
On Manic Mood Disorder (1903)
A Case of Hysterical Stupor in a Prisoner in Detention (1902)
On Simulated Insanity (1903)
A Medical Opinion on a Case of Simulated Insanity (1904)
A Third and Final Opinion on Two Contradictory Psychiatric Diagnoses (1906)
On the Psychological Diagnosis of Facts (1905)

†2. EXPERIMENTAL RESEARCHES

Translated by Leopold Stein in collaboration with Diana Riviere

STUDIES IN WORD ASSOCIATION (1904–7, 1910)
The Associations of Normal Subjects (by Jung and F. Riklin)
An Analysis of the Associations of an Epileptic
The Reaction-Time Ratio in the Association Experiment
Experimental Observations on the Faculty of Memory
Psychoanalysis and Association Experiments
The Psychological Diagnosis of Evidence
Association, Dream, and’ Hysterical Symptom
The Psychopathological Significance of the Association Experiment
Disturbances in Reproduction in the Association Experiment
The Association Method
The Family Constellation

PSYCHOPHYSICAL RESEARCHES (1907–8)
On the Psychophysical Relations of the Association Experiment
Psychophysical Investigations with the Galvanometer and Pneumograph in Normal and Insane Individuals (by F. Peterson and Jung)
Further Investigations on the Galvanic Phenomenon and Respiration in Normal and Insane Individuals (by C. Ricksher and Jung)

Appendix: Statistical Details of Enlistment (1906); New Aspects of Criminal Psychology (1908); The Psychological Methods of Investigation Used in the Psychiatric Clinic of the University of Zurich (1910); On the Doctrine of Complexes ([1911] 1913); On the Psychological Diagnosis of Evidence (1937)

•3. THE PSYCHOGENESIS OF MENTAL DISEASE

The Psychology of Dementia Praecox (1907)
The Content of the Psychoses (1908/1914)
On Psychological Understanding (1914)
A Criticism of Bleuler's Theory of Schizophrenic Negativism (1911)
On the Importance of the Unconscious in Psychopathology (1914)
On the Problem of Psychogenesis in Mental Disease (1919)
Mental Disease and the Psyche (1928)
On the Psychogenesis of Schizophrenia (1939)
Recent Thoughts on Schizophrenia (1957)
Schizophrenia (1958)

†4. FREUD AND PSYCHOANALYSIS

Freud's Theory of Hysteria: A Reply to Aschaffenburg (1906)
The Freudian Theory of Hysteria (1908)
The Analysis of Dreams (1909)
A Contribution to the Psychology of Rumour (1910–11)
On the Significance of Number Dreams (1910–11)
Morton Prince, "The Mechanism and Interpretation of Dreams": A Critical Review (1911)
On the Criticism of Psychoanalysis (1910)
Concerning Psychoanalysis (1912)
The Theory of Psychoanalysis (1913)
General Aspects of Psychoanalysis (1913)
Psychoanalysis and Neurosis (1916)

Some Crucial Points in Psychoanalysis: A Correspondence between Dr. Jung and Dr. Loÿ (1914)
Prefaces to “Collected Papers on Analytical Psychology” (1916, 1917)
The Significance of the Father in the Destiny of the Individual (1909/1949)
Introduction to Kranefeldt’s “Secret Ways of the Mind” (1930)
Freud and Jung: Contrasts (1929)

‡5. SYMBOLS OF TRANSFORMATION (1911–12/1952)

PART 1

Introduction
Two Kinds of Thinking
The Miller Fantasies: Anamnesis
The Hymn of Creation
The Song of the Moth

PART II

Introduction
The Concept of Libido
The Transformation of Libido
The Origin of the Hero
Symbols of the Mother and of Rebirth
The Battle for Deliverance from the Mother
The Dual Mother
The Sacrifice
Epilogue
Appendix: The Miller Fantasies

•6. PSYCHOLOGICAL TYPES (1921)

Introduction
The Problem of Types in the History of Classical and Medieval Thought

Schiller’s Ideas on the Type Problem
The Apollinian and the Dionysian
The Type Problem in Human Character
The Type Problem in Poetry
The Type Problem in Psychopathology
The Type Problem in Aesthetics
The Type Problem in Modern Philosophy
The Type Problem in Biography
General Description of the Types
Definitions
Epilogue
Four Papers on Psychological Typology (1913, 1925, 1931, 1936)

†7. TWO ESSAYS ON ANALYTICAL PSYCHOLOGY

On the Psychology of the Unconscious (1917/1926/1943)
The Relations between the Ego and the Unconscious (1928)
Appendix: New Paths in Psychology (1912); The Structure of the Unconscious (1916) (new versions, with variants, 1966)

‡8. THE STRUCTURE AND DYNAMICS OF THE PSYCHE

On Psychic Energy (1928)
The Transcendent Function ([1916]/1957)
A Review of the Complex Theory (1934)
The Significance of Constitution and Heredity in Psychology (1929)
Psychological Factors Determining Human Behavior (1937)
Instinct and the Unconscious (1919)
The Structure of the Psyche (1927/1931)
On the Nature of the Psyche (1947/1954)
General Aspects of Dream Psychology (1916/1948)
On the Nature of Dreams (1945/1948)
The Psychological Foundations of Belief in Spirits (1920/1948)
Spirit and Life (1926)

Basic Postulates of Analytical Psychology (1931)
Analytical Psychology and *Weltanschauung* (1928/1931)
The Real and the Surreal (1933)
The Stages of Life (1930–1931)
The Soul and Death (1934)
Synchronicity: An Acausal Connecting Principle (1952)
Appendix: On Synchronicity (1951)

9. PART I. THE ARCHETYPES AND THE COLLECTIVE UNCONSCIOUS

Archetypes of the Collective Unconscious (1934/1954)
The Concept of the Collective Unconscious (1936)
Concerning the Archetypes, with Special Reference to the Anima Concept (1936/1954)
Psychological Aspects of the Mother Archetype (1938/1954)
Concerning Rebirth (1940/1950)
The Psychology of the Child Archetype (1940)
The Psychological Aspects of the Kore (1941)
The Phenomenology of the Spirit in Fairytales (1945/1948)
On the Psychology of the Trickster-Figure (1954)
Conscious, Unconscious, and Individuation (1939)
A Study in the Process of Individuation (1934/1950)
Concerning Mandala Symbolism (1950)
Appendix: Mandalas (1955)

9. PART II. AION (1951)

RESEARCHES INTO THE PHENOMENOLOGY OF THE SELF

The Ego
The Shadow
The Syzygy: Anima and Animus
The Self
Christ, a Symbol of the Self

The Sign of the Fishes
The Prophecies of Nostradamus
The Historical Significance of the Fish
The Ambivalence of the Fish Symbol
The Fish in Alchemy
The Alchemical Interpretation of the Fish
Background to the Psychology of Christian Alchemical Symbolism
Gnostic Symbols of the Self
The Structure and Dynamics of the Self
Conclusion

• .10. CIVILIZATION IN TRANSITION

The Role of the Unconscious (1918)
Mind and Earth (1927/1931)
Archaic Man (1931)
The Spiritual Problem of Modern Man (1928/1931)
The Love Problem of a Student (1928)
Woman in Europe (1927)
The Meaning of Psychology for Modern Man (1933/1934)
The State of Psychotherapy Today (1934)
Preface and Epilogue to “Essays on Contemporary Events” (1946)
Wotan (1936)
After the Catastrophe (1945)
The Fight with the Shadow (1946)
The Undiscovered Self (Present and Future) (1957)
Flying Saucers: A Modern Myth (1958)
A Psychological View of Conscience (1958)
Good and Evil in Analytical Psychology (1959)
Introduction to Wolff’s “Studies in Jungian Psychology” (1959)
The Swiss Line in the European Spectrum (1928)
Reviews of Keyserling’s “America Set Free” (1930) and “La Révolution Mondiale” (1934)

The Complications of American Psychology (1930)
The Dreamlike World of India (1939)
What India Can Teach Us (1939)
Appendix: Documents (1933–1938)

†11. PSYCHOLOGY AND RELIGION: WEST AND EAST

WESTERN RELIGION

Psychology and Religion (The Terry Lectures) (1938/1940)
A Psychological Approach to the Dogma of the Trinity (1942/1948)
Transformation Symbolism in the Mass (1942/1954)
Forewords to White’s “God and the Unconscious” and Werblowsky’s “Lucifer and Prometheus” (1952)
Brother Klaus (1933)
Psychotherapists or the Clergy (1932)
Psychoanalysis and the Cure of Souls (1928)
Answer to Job (1952)

EASTERN RELIGION

Psychological Commentaries on “The Tibetan Book of the Great Liberation” (1939/1954) and “The Tibetan Book of the Dead” (1935/1953)
Yoga and the West (1936)
Foreword to Suzuki’s “Introduction to Zen Buddhism” (1939)
The Psychology of Eastern Meditation (1943)
The Holy Men of India: Introduction to Zimmer’s “Der Weg zum Selbst” (1944)
Foreword to the “I Ching” (1950)

•12. PSYCHOLOGY AND ALCHEMY (1944)

Prefatory note to the English Edition ([1951?] added 1967)
Introduction to the Religious and Psychological Problems of Alchemy
Individual Dream Symbolism in Relation to Alchemy (1936)

Religious Ideas in Alchemy (1937)
Epilogue

†13. ALCHEMICAL STUDIES

Commentary on “The Secret of the Golden Flower” (1929)
The Visions of Zosimos (1938/1954)
Paracelsus as a Spiritual Phenomenon (1942)
The Spirit Mercurius (1943/1948)
The Philosophical Tree (1945/1954)

‡14. MYSTERIUM CONIUNCTIONIS (1955–56)

AN INQUIRY INTO THE SEPARATION AND
SYNTHESIS OF PSYCHIC OPPOSITES IN ALCHEMY

The Components of the Coniunctio
The Paradoxa
The Personification of the Opposites
Rex and Regina
Adam and Eve
The Conjunction

•15. THE SPIRIT IN MAN, ART, AND LITERATURE

Paracelsus (1929)
Paracelsus the Physician (1941)
Sigmund Freud in His Historical Setting (1932)
In Memory of Sigmund Freud (1939)
Richard Wilhelm; In Memoriam (1930)
On the Relation of Analytical Psychology to Poetry (1922)
Psychology and Literature (1930/1950)
“Ulysses”: A Monologue (1932)
Picasso (1932)

†16. THE PRACTICE OF PSYCHOTHERAPY

GENERAL PROBLEMS OF PSYCHOTHERAPY
Principles of Practical Psychotherapy (1935)
What Is Psychotherapy? (1935)
Some Aspects of Modern Psychotherapy (1930)
The Aims of Psychotherapy (1931)
Problems of Modern Psychotherapy (1929)
Psychotherapy and a Philosophy of Life (1943)
Medicine and Psychotherapy (1945)
Psychotherapy Today (1945)
Fundamental Questions of Psychotherapy (1951)
SPECIFIC PROBLEMS OF PSYCHOTHERAPY
The Therapeutic Value of Abreaction (1921/1928)
The Practical Use of Dream-Analysis (1934)
The Psychology of the Transference (1946)
Appendix: The Realities of Practical Psychotherapy ([1937] added, 1966)

‡17. THE DEVELOPMENT OF PERSONALITY

Psychic Conflicts in a Child (1910/1946)
Introduction to Wickes's "Analyses der Kinderseele" (1927/1931)
Child Development and Education (1928)
Analytical Psychology and Education: Three Lectures (1926/1946)
The Gifted Child (1943)
The Significance of the Unconscious in Individual Education (1928)
The Development of Personality (1934)
Marriage as a Psychological Relationship (1925)

•18. THE SYMBOLIC LIFE

Miscellaneous Writings

Edited by Aniela Jaffé

[1] “Analysis of a Phobia in a Five-year-old Boy,” *Standard Edition of the Complete Psychological Works of Sigmund Freud*, X (1955; first pub. 1909).

[2] [In the light of Professor Jung’s later researches these theories can be understood as based upon the archetype of rebirth, in the unconscious. Several other examples of archetypal activity are to be found in this essay.—EDITORS.]

[3] One might ask at this point why one is justified in supposing at all that children of this age worry their heads about such theories. The answer is that children are intensely interested in all the sensuously perceptible things going on around them. This also shows itself in the well-known endless questions concerning the why and wherefore of everything. One has to put off the dun-coloured spectacles of our culture for a moment if one wants to understand the psychology of a child. For everybody the birth of a child is quite the most important event there can possibly be. For our civilized thinking, however, birth has lost much of its biological uniqueness, just as sex has done. But somewhere or other the mind must have stored up the correct biological valuations impressed upon it all through the ages. What could be more probable than that the child still has these valuations and makes no bones about showing them, before civilization spreads like a pall over his primitive thinking?

[4] This process is altogether typical. When life comes up against an obstacle, so that no adaptation can be achieved and the transference of libido to reality is suspended, then an introversion takes place. That is to say, instead of the libido working towards reality there is an increased fantasy activity which aims at removing the obstacle, or at least removing it in fantasy, and this may in time lead to a practical solution. Hence the exaggerated sexual fantasies of neurotics, who in this way try to overcome their specific repression; hence also the typical fantasy of stammerers, that they really possess a great talent for eloquence. (That they have some claims in this respect is brought home to us by Alfred Adler’s thoughtful studies on organ inferiority.)

[5] The somewhat paradoxical view that the aim of the child’s question is to be sought in the mother’s answer requires a little discussion. It is one of the greatest of Freud’s services to psychology that he opened up again the whole questionableness of *conscious* motives. One consequence of repressing the instincts is that the importance of conscious thinking for action is boundlessly overestimated. According to Freud, the criterion for the psychology of the act is not the conscious motive, but the *result* of the act (the result being evaluated not physically but psychologically). This view sets the act in a new and biologically revealing light. I refrain from examples and shall content myself with observing that this view is extremely valuable for psychoanalysis both in principle and as regards interpretation.

[6] [In *Coll. Works*, Vol. 3: *The Psychogenesis of Mental Disease*. For the complete contents of the *Collected Works of C. G. Jung*, see the list at the end of this volume.—EDITORS.]

[7] This is a primitive definition of God.

[8] Cf, Franz Riklin, *Wishfulfillment and Symbolism in Fairy Tales* (trans. by W. A. White, Nervous and Mental Disease Monograph Series, No. 21, New York, 1915.

[9] This tendency to get rid of the mother also showed itself in the following incident: The children had requisitioned the tool-shed as a house for themselves and their dolls. An important room in any house is, as we know, the toilet, which obviously cannot be lacking. Accordingly, the children went

to the toilet in a corner of the tool-shed. Their mother naturally could not help spoiling this illusion by forbidding such games. Soon afterwards she caught the remark, “When Mama is dead we’ll do it every day in the tool-shed and put on Sunday clothes every day.”

[10] [Cf. Bronislaw Malinowski, *The Sexual Life of Savages* (3rd edn., London and New York, 1932). —EDITORS.]

[1] [The first three and a half paragraphs originally appeared as an introduction to Frances G. Wickes, *The Inner World of Childhood* (New York, 1927). The book was subsequently translated into German as *Analyse der Kinderseele* (Stuttgart, 1931), and for it Professor Jung expanded his introduction to the present dimensions. It is here translated entirely anew.

Mrs. Wickes (1875–1967) was for many years a school psychologist. She collected numerous case studies, and these were later illuminated for her when she encountered Professor Jung's theories, which she was able to confirm and extend. The most important part of her thesis demonstrates how the unconscious of parents can cause many psychic disorders of childhood.—EDITORS.]

[1] [This lecture was delivered at the International Congress of Education, in Territet (near Montreux) in 1923, and was published in *Contributions to Analytical Psychology* (London and New York, 1928) as the first of four lectures on “Analytical Psychology and Education,” the others being those which follow in the present volume. It was never published in German, but a translation of the original manuscript was made for that volume by H. G. and C. F. Baynes. The present text has been somewhat revised by the author, but is in the main identical with the Baynes version, upon which it is based.—EDITORS.]

[2] [Professor Jung’s position with regard to infantile sexuality is made clear in the first paper in this volume, “Psychic Conflicts in a Child,” and elsewhere in his writings.—EDITORS.]

[3] [Attempts to persuade Professor Jung to write further about his collection of children’s dreams proved unavailing, owing to the pressure upon him of other work. He delivered, however, four series of seminars on the subject between 1935 and 1940, at the Eidgenössische Technische Hochschule, Zurich. The last three were reported by members of the seminars and the transcripts have been privately circulated. Only the third series (winter term, 1938–39) has been translated into English, likewise for private circulation.—Editors.]

[4] I have given elsewhere a number of examples of the extraordinary kinship which exists in the psychological *habitus* of members of the same family, amounting in one case almost to identity. See “The Association Method,” Lecture 2, in *Coll. Works, Vol. 2*.

[5] [This case is also discussed in “The Practical Use of Dream Analysis,” *Coll, Works*, Vol. 16, pars. 323f., where further details will be found.—EDITORS.]

LECTURE ONE

[1] Freud also translated Hippolyte Bernheim's work into German, under the title Die Suggestion und ihre Heilwirkung (Leipzig and Vienna, 1888).

[2] Cf. my dissertation, "On the Psychology and Pathology of So-called Occult Phenomena," *Coll. Works*, Vol. I.

[3] [See *Standard Edition of the Complete Psychological Works of Sigmund Freud*, IX (1959) and X (1955).—EDITORS.]

[4] The results of my own experiments and those of my fellow workers are set forth in *Studies in Word Association*, trans. by M. D. Eder (London, 1918; New York, 1919). [For Jung's contributions, see *Coll. Works, Vol. 2.—EDITORS.]*

[5] The so-called "complex theory" found its application in the psychopathology of schizophrenia (Cf. my *The Psychology of Dementia Praecox, Coll. Works*, Vol. 3). An account of the same appears in "A Review of the Complex Theory," *Coll. Works*, Vol. 8.

[6] It is interesting to see how the subliminally existing murder which was seeking to attach itself to the patient in later life (bearded man) is compensated by the disease (the nurse), as if the disease were protecting him against the crime.

[7] Cf. my "The Psychological Aspects of the Mother Archetype," *Coll. Works*, Vol. 9, pt. 1, and "Mind and Earth," *Coll. Works*, Vol. 10.

[8] [Christoph Blumhardt (1842–1919), eminent Swiss theologian and Social Democrat.—EDITORS.]

LECTURE TWO

[1] Or, to quote the words of a philosopher: “Before supper I am a Kantian, after supper a Nietzschean.”

[2] A very promising beginning has been made in the excellent work of Walter H. von Wyss: *Psychophysiologische Probleme in der Medizin* (Basel, 1944).

[3] [Professor Jung elaborates this theme in “Sigmund Freud in His Historical Setting,” *Coll. Works*, Vol. 15—EDITORS.]

[4] Where this fails to work it is put down to the patient’s “resistances.”

[5] I am indebted to Professor Markus Fierz, of Basel, for this formulation,

[6] Cf. C. A. Meier’s conspectus of the relevant literature, up to 1935, under “Moderne Physik—Moderne Psychologie,” in *Die kulturelle Bedeutung der komplexen Psychologie* (Berlin, 1935), pp. 34Qff. I would refer the reader particularly to the extensive quotations from articles by Niels Bohr, *Naturwissenschaft*, XVI (1928), 245, and XVII (1929), 483. Since the latter date see particularly Pascual Jordan, *Die Physik des 20. Jahrhunderts* (Brunswick, 1936), also his “Positivische Bemerkungen über die paraphysischen Erscheinungen,” *Zentralblatt für Psychotherapie*, IX (1936), 3ff.; *Anschauliche Quantentheorie* (Berlin, 1936), pp. 271ff.; *Die Physik und das Geheimnis des organischen Lebens* (Brunswick, 1941), pp. 114ff.

[7] Cf. my essay “Spirit and Life,” *Coll. Works*, Vol. 8.

[8] Cf. Toni Wolff, “Einführung in die Grundlagen der komplexen Psychologie,” Ch. I, *Die kulturelle Bedeutung der komplexen Psychologie*.

[9] There are only pale reflections of this word in French and English, such as “idée,” “idea,” “sudden idea,” etc. The German “witzige Einfall” fares a little better as “saillie” or “sally of wit” (from *saillir*, “to rush forth”).

[10] Carl du Prel, *Das Rätsel des Menschen* (Leipzig, 1892), pp. 27ff.

[11] Cf. *Studies in Word Association, Coll. Works*, Vol. 2; and “A Review of the Complex Theory,” *Coll. Works*, Vol. 8.

[12] Cf. the classic work of Breuer and Freud, *Studies on Hysteria* (1893–95).

[13] Cf. my *Symbols of Transformation, Coll. Works*, Vol. 5; “The Psychology of the Child Archetype” and “The Psychological Aspects of the Kore,” *Coll. Works*, Vol. 9, pt. i.

[14] Cf. my “Individual Dream Symbolism in Relation to Alchemy,” in *Psychology and Alchemy, Coll. Works*, Vol. 12.

[15] Cf. my “Archetypes of the Collective Unconscious,” *Coll. Works*, Vol. 9, pt. i.

LECTURE THREE

[1] *Coll, Works, Vol. 1*.

[2] [Cf. Freud's *Civilization and Its Discontents*, *Standard Edition of the Complete Psychological Works of Sigmund Freud*, XXI (1961; first pub. 1930).—EDITORS.]

[3] Cf. the above-mentioned case (pars. 182f.) of a young man who sunned himself on the Riviera and in the Engadine.

[3a] [Cf. Jung, "Paracelsus as a Spiritual Phenomenon," *Coll. Works*, Vol. 13; and Jolande Jacobi, ed., *Paracelsus; Selected Writings* (New York [Bollingen Series XXVII] and London, 2nd edn., 1958), p. 39.—EDITORS.]

[4] Called "gana loss" in South America. [Spanish, gana = lit., "appetite," "desire." See Count Hermann Keyserling, *South-American Meditations*, trans. by Theresa Duerr (New York and London, 1932), pp. 158ff., on this usage in Buenos Aires.—EDITORS.]

[4a] [This case is also discussed in *Two Essays on Analytical Psychology, Coll. Works*, Vol. 7, par. 287.—EDITORS.]

[5] I do not wish to give offence to the dreamer of the dream under discussion, whom I do not know personally; but I hardly think that a young man of twenty-two would be conscious of the problem broached by this dream, at least, not of its full extent.

[6] This is not to be identified with ignorance. In order to get at an infantile neurosis or a difficult child, sound knowledge is needed as well as all the other things.

[7] Well known as the author of *The Inner World of Childhood* (New York and London, 1927), and of *The Inner World of Man* (New York, London, and Toronto, 1938; 2nd edn., 1948). I should like to recommend the first book in particular to parents and teachers. [See the second paper in this volume, an introduction to the German edition.—EDITORS.]

[8] This is the manifestation of an archetype, namely that of the deadly, devouring mother. Cf. the fairytales of Red Riding Hood and of Hansel and Gretel, and the South Sea myth of Maui and Hine-nui-te-po, the tribal ancestress who sleeps with her mouth open. Maui creeps into the mouth and is swallowed (Leo Frobenius, *Das Zeitalter des Sonnengottes*, Berlin, 1904, I, pp. 66ff.).

[9] Cf. the snake symbolism in *Symbols of Transformation, Coll. Works*, Vol. 5.

[10] Superficially this dream can be understood as a wish-fulfilment, but closer examination would show that it sums up the facts. For the daughter the mother signifies the feminine instinctual ground-layer which in this case is profoundly disturbed.

[1] [This was first delivered at the annual meeting of the Basel School Council, in December, 1942. It was published as “Der Begabte” in the *Schweizer Erziehungs Rundschau*, XVI (1943): 1, and in *Psychologie und Erziehung* (Zurich, 1946), from which the present translation is made.—EDITORS.]

[2] [By and large, children in Switzerland are taught in classes composed of pupils belonging to the same age group. There is no attempt to separate them according to their ability as is usual in Great Britain.—EDITORS.]

[1] [Originally delivered as a lecture at the International Congress of Education, Heidelberg, 1925, and subsequently translated by C. F. and H. G. Baynes in *Contributions to Analytical Psychology* (London and New York, 1928). The present translation is newly made from the original manuscript, though the earlier English version has been freely consulted.—EDITORS.]

[2] [This case is also discussed in *Two Essays on Analytical Psychology, Coll. Works*, Vol. 7, pars. 167ff.—EDITORS.]

[1] [First delivered as a lecture entitled “Die Stimme des Innern” at the Kulturbund, Vienna, in November, 1932. Subsequently published under the title “Vom Werden der Persönlichkeit” in *Wirklichkeit der Seele* (Zurich, Leipzig, and Stuttgart, 1934), and translated into English by Stanley M. Dell as the final chapter of *The Integration of the Personality* (New York, 1939, and London, 1940). The present new translation is made from *Wirklichkeit der Seele*, though the earlier English version has been freely consulted.—EDITORS.]

[2] *Westästlicker Diwan*, Suleikabuch.

[3] Since this sentence was written, Germany too has found her Führer.

[4] [Cf. C. Kerényi, “The Primordial Child in Primordial Times,” and Jung, “The Psychology of the Child-Archetype,” *in Essays on a Science of Mythology* (Bollingen Series XXII, N. Y” 1949; Princeton/Bollingen Paperback edn., revised, 1969; British edn.: *Introduction to a Science of Mythology*, London, 1950).—EDITORS.]

[5] [In the German, attributed to Nietzsche.—EDITORS.]

[1] [First published as “Die Ehe als psychologische Beziehung,” in *Das Ehebuch* (Celle, 1925), a volume edited by Count Hermann Keyserling; translated by Theresa Duerr in the English version, *The Book of Marriage* (New York, 1926). The original was reprinted in *Seelenprobleme der Gegenwart* (Zurich, 1931). The essay was again tianslated into English by H. G. and Cary F. Baynes in *Contributions to Analytical Psychology* (London and New York, 1928), and this version has been freely consulted in the present translation.—EDITORS.]

[2] [In translating this and the following passages, I have, for the sake of clarity, assumed that the container is the man and the contained the woman. This assumption is due entirely to the exigencies of English grammar, and is not *implied in the German text*. Needless to say, the situation could just as easily be reversed.—TRANS.]

[3] There are excellent descriptions of this type in H. Rider Haggard’s *She* (London, 1887) and Pierre Benoît’s *L’Atlantide* (Paris, 1920; trans. by Mary C. Tongue and Mary Ross as *Atlantida*, New York, 1920).

[4] A passably good account of the animus is to be found in Marie Hay’s book *The Evil Vineyard* (New York, 1923), also in Elinor Wylie’s *Jennifer Lorn* (New York, 1923) and Selma Lagerlöf’s *Gösta Berlings Saga* (1891; English trans. by P. B. Flach, *The Story of Gösta Berling*, 1898).

EDITORIAL NOTE

When these Collected Works were planned, during the late 1940's, in consultation with Professor Jung, the Editors set aside a brief final volume for "reviews, short articles, etc., of the psychoanalytic period, later introductions, etc., Bibliography of Jung's Writings, and General Index of the Collected Works." Now arriving at publication soon after Jung's centenary year, this collection of miscellany has become the most ample volume in the edition—and no longer includes the Bibliography and General Index, which have been assigned to volumes 19 and 20 respectively.

Volume 18 now contains more than one hundred and thirty items, ranging in time from 1901, when Jung at 26 had just accepted his first professional appointment as an assistant at the Burghölzli, to 1961, shortly before his death. The collection, touching upon virtually every aspect of Jung's professional and intellectual interest during a long life devoted to the exegesis of the symbol, justifies its title, taken from a characteristic work of Jung's middle years, the seminar given to the Guild of Pastoral Psychology in London, 1939.

This profusion of material is the consequence of three factors. After Jung retired from his active medical practice, in the early 1950's, until his death in June 1961, he devoted most of his time to writing: not only the longer works for which a place was made in the original scheme of the edition, but an unexpectedly large number of forewords to books by pupils and colleagues, replies to journalistic questionnaires, encyclopaedia articles, occasional addresses, and letters (some of which, because of their technical character, or because they were published elsewhere, are included in Volume 18 rather than in the *Letters* volumes). Of works in this class, Jung wrote some fifty after 1950.

Secondly, research for the later volumes of the Collected Works, for the *Letters* (including *The Freud/Jung Letters*), and for the General Bibliography has brought to light many reviews, short articles, reports, etc., from the earlier years of Jung's career. A considerable run of psychiatric reviews from the years 1906–1910 was discovered by Professor Henri F. Ellenberger and turned over to the Editors, who wish to record their gratitude to him.

Finally, the Jung archives at Küsnacht have yielded several manuscripts in a finished or virtually finished state, the earliest being a 1901 report on Freud's *On Dreams*. A related category of material embraces abstracts of lectures, evidently unwritten, the transcripts of which were not read and approved by Jung. The abstracts themselves have been deemed worthy of inclusion in this volume.

"The Tavistock Lectures" and "The Symbolic Life" are examples of oral material to whose transcription Jung *had* given his approval. The former work has become well known as *Analytical Psychology: Its Theory and Practice*, under which title the present version was published in 1968.

Around 1960, the Editors conceived the idea of adding to Volume 15, *The Spirit in Man, Art, and Literature*, some of the forewords that Jung had written for books by other persons, on the ground that these statements were an expression of the archetype of the spirit. Jung was invited to make the choice, and his list comprised fifteen forewords, to books by the following authors: Lily Abegg, John Custance, Linda Fierz-David, Michael Fordham, M. Esther Harding (two books), Aniela Jaffé, Olga yon Koenig-Fachsenfeld, Rose Mehlich, Fanny Moser, John Weir Perry, Carl Ludwig Schleich, Gustav Schmaltz, Hans Schmid-Guisan, and Oscar A. H. Schmitz. Subsequently, as the plan for a comprehensive volume of miscellany took form, these forewords were retained in Volume 18.

The contents of the present volume—following after the three longer and more general works in Parts I, II, and III—are arranged as Parts IV through XVI, in the sequence of the volumes of the Collected Works to which they are related by subject, and chronologically within each Part. The result is sometimes arbitrary, as certain items could be assigned to more than one volume. Some miscellanea were published in later editions or printings of the previous volumes, e.g., "The Realities of Practical Psychotherapy," now an appendix in Volume 16, 2nd edition; the prefatory note to the English edition of *Psychology and Alchemy*, now in the 2nd edition of Volume 12;

and the author's note to the first American/English edition of *Psychology of the Unconscious* (1916), now in Volume 5, 2nd edition, 1974 printing.

The death of the translator, R.F.C. Hull, in December 1974, after a prolonged illness, was a heavy loss to the entire enterprise. He had, however, translated by far most of the contents of Volume 18. The contributions of other translators are indicated by their initials in a footnote at the beginning of the translated item: A.S.B. Glover, Ruth Horine, Hildegard Nagel, Jane D. Pratt, Lisa Ress, and Wolfgang Sauerlander. To them the Editors are deeply grateful. Mr. Glover, up until his death in 1966, also played an important part in the compilation and editing of the papers. Special acknowledgement must be made to two co-workers at the source, as it were, who contributed greatly by searching out material and helping to identify and annotate the texts: Marianne Niehus-Jung (d. 1965), who was a co-editor of the Swiss edition of her father's collected works, and Aniela Jaffé, who had been Jung's secretary and collaborator with him in the writing of his memoirs.

Acknowledgement is made also to the following, who gave valued assistance with research and advice with various editorial problems: Mrs. Doris Albrecht, Dr. E. A. Bennet, Professor Ernst Benz, Jonathan Dodd, Dr. Martin Ebon, Mrs. Antoinette Fierz, C.H.A. Fleurent (*British Medical Journal*) Dr. M.-L. von Franz, Dr. W. H. Gillespie, Michael Hamburger (also for permission to quote his translation of a poem of Hölderlin), J. Havet (Unesco), Dr. Joseph Henderson, Mrs. Aniela Jaffé, Mrs. Ernest Jones, Mrs. Jean Jones (American Psychiatric Association), Mr. and Mrs. Franz Jung, Dr. James Kirsch, Pamela Long, Professor Dr. C. A. Meier, Professor W. G. Moulton, Professor Henry A. Murray, Mrs. Julie Neumann, Jacob Rabi (*Al Hamishmar*), Lisa Ress, Professor Paul Roazen, Professor D. W. Robertson, Jr., Wolfgang Sauerlander, G. Spencer-Brown, Gerald Sykes, Professor Kurt Weinberg, and Mrs. Shirley White (BBC).

THE TAVISTOCK LECTURES

On the Theory and Practice of Analytical Psychology

EDITORIAL NOTE

C. G. Jung was invited by the Institute of Medical Psychology (Tavistock Clinic), Malet Place, London, at the instigation of Dr. J. A. Hadfield, to give a series of five lectures, which he delivered September 30 to October 4, 1935. According to the 1935 report of the Institute, the Lectures when announced were not titled. The audience, of some two hundred, consisted chiefly of members of the medical profession. A stenographic record was taken of the lectures and the subsequent discussions; the transcript was edited by Mary Barker and Margaret Game, passed by Professor Jung, and printed by mimeograph for private distribution by the Analytical Psychology Club of London, in 1936, under the title “Fundamental Psychological Conceptions: A Report of Five Lectures by C. G. Jung …” The work has become widely known as “The Tavistock Lectures” or “The London Seminars.”

Passages from the Lectures were published in a French translation by Dr. Roland Cahen in his edition of Jung’s *L’Homme à la découverte de son âme* (Geneva, 1944; cf. infra, pars. 1357ff.), where the editor inserted them in a transcript of a series of seminars that Jung gave to the Société de Psychologie of Basel in 1934. Jung included much of the same material in both the London and Basel series as well as in lectures given in 1934 and 1935 at the Eidgenössische Technische Hochschule, Zurich.

The present text underwent stylistic revision by R.F.C. Hull, under the supervision of the Editors of the Collected Works, and the footnotes inserted by the original editors were augmented (in square brackets). The text was published in 1968 under the title *Analytical Psychology: Its Theory* *and Practice; The Tavistock Lectures* (New York: Pantheon Books, and London: Routledge & Kegan Paul), with the addition of a foreword, by E. A. Bennet, and an appendix giving biographical details of the participants in the discussion (both now omitted).

Grateful acknowledgment is made to Mrs. Barker and Mrs. Game, for their co-operation; to those living among the participants in the discussions who gave permission to reproduce their remarks; to Dr. Roland Cahen; and to Mr. Sidney Gray, present secretary of the Tavistock Institute of Medical Psychology, for his assistance. For advice in the preparation of the notes, the Editors are obliged to Joseph Campbell, J. Desmond Clark, Etienne Gilson, Norbert Guterman, Mrs. Lilly Jung, E. Dale Saunders, and Mrs. Ruth Spiegel.

PREFATORY NOTE TO THE ORIGINAL EDITION

This report of Professor Jung's Lectures to the Institute of Medical Psychology is edited under the auspices of the Analytical Psychology Club, London.

On the whole the report is verbatim, though it has been considered advisable to alter the construction of certain sentences with a view to avoiding any ambiguity of meaning. The editors can only hope that in making these minor changes they have not destroyed the very individual flavour of the Lectures.

In a few cases it was found impossible to ascertain the names of those taking part in the discussions, nor was it practicable to submit proofs of their questions to each of the speakers. For this deficiency and for any possible errors in the reporting of questions we offer our apology.

The stencils of the charts, diagrams, and drawings have been cut with Professor Jung's permission from the originals in his possession.[1]

Our thanks are due to the Institute of Medical Psychology not only for giving the Analytical Psychology Club permission to report the Lectures but also for facilitating the work in every way. To Miss Toni Wolff we would express our special gratitude for helping us with our task. Finally, and above all, we wish to thank Professor Jung for answering questions about difficult points and for passing the report in its final form.

MARY BARKER
MARGARET GAME

London, October 1935

LECTURE I

The Chairman (Dr. H. Crichton-Miller):

[1] Ladies and Gentlemen, I am here to express your welcome to Professor Jung, and it gives me great pleasure to do so. We have looked forward, Professor Jung, to your coming for several months with happy anticipation. Many of us no doubt have looked forward to these seminars hoping for new light. Most of us, I trust, are looking forward to them hoping for new light upon ourselves. Many have come here because they look upon you as the man who has saved modern psychology from a dangerous isolation in the range of human knowledge and science into which it was drifting. Some of us have come here because we respect and admire that breadth of vision with which you have boldly made the alliance between philosophy and psychology which has been so condemned in certain other quarters. You have restored for us the idea of value, the concept of human freedom in psychological thought; you have given us certain new ideas that to many of us have been very precious, and above all things you have not relinquished the study of the human psyche at the point where all science ends. For this and many other benefits which are known to each of us independently and individually we are grateful to you, and we anticipate with the highest expectations these meetings.

Professor Jung:

[2] Ladies and Gentlemen: First of all I should like to point out that my mother tongue is not English; thus if my English is not too good I must ask your forgiveness for any error I may commit.

[3] As you know, my purpose is to give you a short outline of certain fundamental conceptions of psychology. If my demonstration is chiefly concerned with my own principles or my own point of view, it is not that I overlook the value of the great contributions of other workers in this

field. I do not want to push myself unduly into the foreground, but I can surely expect my audience to be as much aware of Freud's and Adler's merits as I am.

[4] Now as to our procedure, I should like to give you first a short idea of my programme. We have two main topics to deal with, namely, on the one side the concepts concerning the *structure of the unconscious mind* and its *contents*; on the other, the *methods* used in the *investigation* of contents originating in the unconscious psychic processes. The second topic falls into three parts, first, the word-association method; second, the method of dream-analysis; and third, the method of active imagination.

[5] I know, of course, that I am unable to give you a full account of all there is to say about such difficult topics as, for instance, the philosophical, religious, ehical, and social problems peculiar to the collective consciousness of our time, or the processes of the collective unconscious and the comparative mythological and historical researches necessary for their elucidation. These topics, although apparently remote, are yet the most potent factors in making, regulating, and disturbing the personal mental condition, and they also form the root of disagreement in the field of psychological theories. Although I am a medical man and therefore chiefly concerned with psychopathology, I am nevertheless convinced that this particular branch of psychology can only be benefited by a considerably deepened and more extensive knowledge of the normal psyche in general. The doctor especially should never lose sight of the fact that diseases are disturbed normal processes and not *entia per se* with a psychology exclusively their own. *Similia similibus curantur* is a remarkable truth of the old medicine, and as a great truth it is also liable to become great nonsense. Medical psychology, therefore, should be careful not to become morbid itself. One-sidedness and restriction of horizon are well-known neurotic peculiarities.

[6] Whatever I may be able to tell you will undoubtedly remain a regrettably unfinished torso. Unfortunately I take little stock of new theories, as my empirical temperament is more eager for new facts than for what one might speculate about them, although this is, I must admit, an enjoyable intellectual pastime. Each new case is almost a new theory to me, and I am not quite convinced that this standpoint is a thoroughly

bad one, particularly when one considers the extreme youth of modern psychology, which to my mind has not yet left its cradle. I know, therefore, that the time for general theories is not yet ripe. It even looks to me sometimes as if psychology had not yet understood either the gigantic size of its task, or the perplexingly and distressingly complicated nature of its subject-matter: the psyche itself. It seems as if we were just waking up to this fact, and that the dawn is still too dim for us to realize in full what it means that the psyche, being the *object* of scientific observation and judgment, is at the same time its *subject*, the *means* by which you make such observations. The menace of so formidably vicious a circle has driven me to an extreme of caution and relativism which has often been thoroughly misunderstood.

[7] I do not want to disturb our dealings by bringing up disquieting critical arguments. I only mention them as a sort of anticipatory excuse for seemingly unnecessary complications. I am not troubled by theories, but a great deal by facts; and I beg you therefore to keep in mind that the shortness of time at my disposal does not allow me to produce all the circumstantial evidence which would substantiate my conclusions. I especially refer here to the intricacies of dream-analysis and to the comparative method of investigating the unconscious processes. In short, I have to depend a great deal upon your goodwill, but I realize naturally it is my own task in the first place to make things as plain as possible.

[8] Psychology is a science of consciousness, in the very first place. In the second place, it is the science of the products of what we call the unconscious psyche. We cannot directly explore the unconscious psyche because the unconscious is just unconscious, and we have therefore no relation to it. We can only deal with the conscious products which we suppose have originated in the field called the unconscious, that field of "dim representations" which the philosopher Kant in his *Anthropology*[1] speaks of as being half a world. Whatever we have to say about the unconscious is what the conscious mind says about it. Always the unconscious psyche, which is entirely of an unknown nature, is expressed by consciousness and in terms of consciousness, and that is the only thing we can do. We cannot go beyond that, and we should always keep it in mind as an ultimate critique of our judgment.

[9] Consciousness is a peculiar thing. It is an intermittent phenomenon. One-fifth, or one-third, or perhaps even one-half of our human life is spent in an unconscious condition. Our early childhood is unconscious. Every night we sink into the unconscious, and only in phases between waking and sleeping have we a more or less clear consciousness. To a certain extent it is even questionable how clear that consciousness is. For instance, we assume that a boy or girl ten years of age would be conscious, but one could easily prove that it is a very peculiar kind of consciousness, for it might be a consciousness without any consciousness of the *ego*. I know a number of cases of children eleven, twelve, and fourteen years of age, or even older, suddenly realizing "I am." For the first time in their lives they know that they themselves are experiencing, that they are looking back over a past in which they can remember things happening but cannot remember that they were in them.

[10] We must admit that when we say "I" we have no absolute criterion whether we have a full experience of "I" or not. It might be that our realization of the ego is still fragmentary and that in some future time people will know very much more about what the ego means to man than we do. As a matter of fact, we cannot see where that process might ultimately end.

[11] Consciousness is like a surface or a skin upon a vast unconscious area of unknown extent. We do not know how far the unconscious rules because we simply know nothing of it. You cannot say anything about a thing of which you know nothing. When we say "the unconscious" we often mean to convey something by the term, but as a matter of fact we simply convey that we do not know what the unconscious is. We have only indirect proofs that there is a mental sphere which is subliminal. We have some scientific justification for our conclusion that it exists. From the products which that unconscious mind produces we can draw certain conclusions as to its possible nature. But we must be careful not to be too anthropomorphic in our conclusions, because things might in reality be very different from what our consciousness makes them.

[12] If, for instance, you look at our physical world and if you compare what our consciousness makes of this same world, you find all sorts of

mental pictures which do not exist as objective facts. For instance, we see colour and hear sound, but in reality they are oscillations. As a matter of fact, we need a laboratory with very complicated apparatus in order to establish a picture of that world apart from our senses and apart from our psyche; and I suppose it is very much the same with our unconscious—we ought to have a laboratory in which we could establish by objective methods how things really are when in an unconscious condition. So any conclusion or any statement I make in the course of my lectures about the unconscious should be taken with that critique in mind. It is always *as if*, and you should never forget that restriction.

[13] The conscious mind moreover is characterized by a certain narrowness. It can hold only a few simultaneous contents at a given moment. All the rest is unconscious at the time, and we only get a sort of continuation or a general understanding or awareness of a conscious world through the *succession* of conscious moments. We can never hold an image of totality because our consciousness is too narrow; we can only see flashes of existence. It is always as if we were observing through a slit so that we only see a particular moment; all the rest is dark and we are not aware of it at that moment. The area of the unconscious is enormous and always continuous, while the area of consciousness is a restricted field of momentary vision.

[14] Consciousness is very much the product of perception and orientation in the *external* world. It is probably localized in the cerebrum, which is of ectodermic origin and was probably a sense organ of the skin at the time of our remote ancestors. The consciousness derived from that localization in the brain therefore probably retains these qualities of sensation and orientation. Peculiarly enough, the French and English psychologists of the early seventeenth and eighteenth centuries tried to derive consciousness from the senses as if it consisted solely of sense data. That is expressed by the famous formula *Nihil est in intellectu quod non fuerit in sensu*.[2] You can observe something similar in modern psychological theories. Freud, for instance, does not derive the conscious from sense data, but he derives the unconscious from the conscious, which is along the same rational line.

[15] I would put it the reverse way: I would say the thing that comes first is obviously the unconscious and that consciousness really arises from an unconscious condition. In early childhood we are unconscious; the most important functions of an instinctive nature are unconscious, and consciousness is rather the product of the unconscious. It is a condition which demands a violent effort. You get tired from being conscious. You get exhausted by consciousness. It is an almost unnatural effort. When you observe primitives, for instance, you will see that on the slightest provocation or with no provocation whatever they doze off, they disappear. They sit for hours on end, and when you ask them, "What are you doing? What are you thinking?" they are offended, because they say, "Only a man that is crazy thinks—he has thoughts in his head. We do not think." If they think at all, it is rather in the belly or in the heart. Certain Negro tribes assure you that thoughts are in the belly because they only realize those thoughts which actually disturb the liver, intestines, or stomach. In other words, they are conscious only of emotional thoughts. Emotions and affects are always accompanied by obvious physiological innervations.

[16] The Pueblo Indians told me that all Americans are crazy, and of course I was somewhat astonished and asked them why. They said, "Well, they say they think in their heads. No sound man thinks in the head. *We* think in the heart." They are just about in the Homeric age, when the diaphragm (*phren* = mind, soul) was the seat of psychic activity. That means a psychic localization of a different nature. *Our* concept of consciousness supposes thought to be in our most dignified head. But the Pueblo Indians derive consciousness from the intensity of feeling. Abstract thought does not exist for them. As the Pueblo Indians are sun-worshippers, I tried the argument of St. Augustine on them. I told them that God is not the sun but the one who made the sun.[3] They could not accept this because they cannot go beyond the perceptions of their senses and their feelings. Therefore consciousness and thought to them are localized in the heart. To us, on the other hand, psychic activities are nothing. We hold that dreams and fantasies are localized "down below," therefore there are people who speak of the *sub*-conscious mind, of the things that are *below* consciousness.

[17] These peculiar localizations play a great role in so-called primitive psychology, which is by no means primitive. For instance if you study Tantric Yoga and Hindu psychology you will find the most elaborate system of psychic layers, of localizations of consciousness up from the region of the perineum to the top of the head. These “centres” are the so-called *chakras*[4] and you not only find them in the teachings of yoga but can discover the same idea in old German alchemical books,[5] which surely do not derive from a knowledge of yoga.

[18] The important fact about consciousness is that nothing can be conscious without an ego to which it refers. If something is not related to the ego then it is not conscious. Therefore you can define consciousness as a relation of psychic facts to the ego. What is that ego? The ego is a complex datum which is constituted first of all by a general awareness of your body, of your existence, and secondly by your memory data; you have a certain idea of having been, a long series of memories. Those two are the main constituents of what we call the ego. Therefore you can call the ego a complex of psychic facts. This complex has a great power of attraction, like a magnet; it attracts contents from the unconscious, from that dark realm of which we know nothing; it also attracts impressions from the outside, and when they enter into association with the ego they are conscious. If they do not, they are not conscious.

[19] My idea of the ego is that it is a sort of complex. Of course, the nearest and dearest complex which we cherish is our ego. It is always in the centre of our attention and of our desires, and it is the absolutely indispensable centre of consciousness. If the ego becomes split up, as in schizophrenia, all sense of values is gone, and also things become inaccessible for voluntary reproduction because the centre has split and certain parts of the psyche refer to one fragment of the ego and certain other contents to another fragment of the ego. Therefore, with a schizophrenic, you often see a rapid change from one personality into another.

[20] You can distinguish a number of functions in consciousness. They enable consciousness to become oriented in the field of ectopsychic facts and endopsychic facts. What I understand by the *ectopsyche* is a system

of relationship between the contents of consciousness and facts and data coming in from the environment. It is a system of orientation which concerns my dealing with the external facts given to me by the function of my senses. The *endopsyche*, on the other hand, is a system of relationship between the contents of consciousness and postulated processes in the unconscious.

[21] In the first place we will speak of the ectopsychic functions. First of all we have *sensation,*[6] our sense function. By sensation I understand what the French psychologists call "la fonction du réel," which is the sum-total of my awareness of external facts given to me through the function of my senses. So I think that the French term "la fonction du réel" explains it in the most comprehensive way. Sensation tells me that something *is:* it does not tell me *what* it is and it does not tell me other things about that something; it only tells me that something is.

[22] The next function that is distinguishable is *thinking*.[7] Thinking, if you ask a philosopher, is something very difficult, so never ask a philosopher about it because he is the only man who does not know what thinking is. Everybody else knows what thinking is. When you say to a man, "Now think properly," he knows exactly what you mean, but a philosopher never knows. Thinking in its simplest form tells you *what* a thing is. It gives a name to the thing. It adds a concept because thinking is perception and judgment. (German psychology calls it apperception.)[8]

[23] The third function you can distinguish and for which ordinary language has a term is *feeling.*[9] Here minds become very confused and people get angry when I speak about feeling, because according to their view I say something very dreadful about it. Feeling informs you through its feeling-tones of the *values* of things. Feeling tells you for instance whether a thing is acceptable or agreeable or not. It tells you what a thing is *worth* to you. On account of that phenomenon, you cannot perceive and you cannot apperceive without having a certain feeling reaction. You always have a certain feeling-tone, which you can even demonstrate by experiment. We will talk of these things later on. Now the "dreadful" thing about feeling is that it is, like thinking, a *rational*[10] function. All men who think are absolutely convinced that feeling is never a rational

function but, on the contrary, most irrational. Now I say: Just be patient for a while and realize that man cannot be perfect in every respect. If a man is perfect in his thinking he is surely never perfect in his feeling, because you cannot do the two things at the same time; they hinder each other. Therefore when you want to think in a dispassionate way, really scientifically or philosophically, you must get away from all feeling-values. You cannot be bothered with feeling-values at the same time, otherwise you begin to feel that it is far more important to think about the freedom of the will than, for instance, about the classification of lice. And certainly if you approach from the point of view of feeling the two objects are not only different as to *facts* but also as to *value*. Values are no anchors for the intellect, but they exist, and giving value is an important psychological function. If you want to have a complete picture of the world you must necessarily consider values. If you do not, you will get into trouble. To many people feeling appears to be most irrational, because you feel all sorts of things in foolish moods; therefore everybody is convinced, in this country particularly, that you should control your feelings. I quite admit that this is a good habit and wholly admire the English for that faculty. Yet there are such things as feelings, and I have seen people who control their feelings marvellously well and yet are terribly bothered by them.

[24] Now the fourth function. Sensation tells us that a thing *is*. Thinking tells us *what* that thing is, feeling tells us what it is *worth* to us. Now what else could there be? One would assume one has a complete picture of the world when one knows there *is* something, *what* it is, and what it is *worth*. But there is another category, and that is time. Things have a past and they have a future. They come from somewhere, they go to somewhere, and you cannot see where they came from and you cannot know where they go to, but you get what the Americans call a hunch. For instance, if you are a dealer in art or in old furniture you get a hunch that a certain object is by a very good master of 1720, you get a hunch that it is good work. Or you do not know what shares will do after a while, but you get the hunch that they will rise. That is what is called *intuition*,[11] a sort of divination, a sort of miraculous faculty. For instance, you do not know that your patient has something on his mind of a very painful kind,

but you “get an idea,” you “have a certain feeling,” as we say, because ordinary language is not yet developed enough for one to have suitably defined terms. The word intuition becomes more and more a part of the English language, and you are very fortunate because in other languages that word does not exist. The Germans cannot even make a linguistic distinction between sensation and feeling. It is different in French; if you speak French you cannot possibly say that you have a certain “sentiment dans l’estomac,” you will say “sensation”; in English you also have your distinctive words for sensation and feeling. But you can mix up *feeling* and *intuition* easily. Therefore it is an almost artificial distinction I make here, though for practical reasons it is most important that we make such a differentiation in scientific language. We must define what we mean when we use certain terms, otherwise we talk an unintelligible language, and in psychology this is always a misfortune. In ordinary conversation, when a man says feeling, he means possibly something entirely different from another fellow who also talks about feeling. There are any number of psychologists who use the word *feeling*, and they define it as a sort of crippled thought. “Feeling is nothing but an unfinished thought”—that is the definition of a well-known psychologist. But feeling is something genuine, it is something real, it is a function, and therefore we have a word for it. The instinctive natural mind always finds the words that designate things which really have existence. Only psychologists invent words for things that do not exist.

[25] The last-defined function, intuition, seems to be very mysterious, and you know I am “very mystical,” as people say. This then is one of my pieces of mysticism! Intuition is a function by which you see round corners, which you really cannot do; yet the fellow will do it for you and you trust him. It is a function which normally you do not use if you live a regular life within four walls and do regular routine work. But if you are on the Stock Exchange or in Central Africa, you will use your hunches like anything. You cannot, for instance, calculate whether when you turn round a corner in the bush you will meet a rhinoceros or a tiger—but you get a hunch, and it will perhaps save your life. So you see that people who live exposed to natural conditions use intuition a great deal, and people who risk something in an unknown field, who are pioneers of

some sort, will use intuition. Inventors will use it and judges will use it. Whenever you have to deal with strange conditions where you have no established values or established concepts, you will depend upon that faculty of intuition.

[26] I have tried to describe that function as well as I can, but perhaps it is not very good. I say that intuition is a sort of perception which does not go exactly by the senses, but it goes via the unconscious, and at that I leave it and say "I don't know how it works." I do not know what is happening when a man knows something he definitely should not know. I do not know how he has come by it, but he has it all right and he can act on it. For instance, anticipatory dreams, telepathic phenomena, and all that kind of thing are intuitions. I have seen plenty of them, and I am convinced that they do exist. You can see these things also with primitives. You can see them everywhere if you pay attention to these perceptions that somehow work through the subliminal data, such as sense-perceptions so feeble that our consciousness simply cannot take them in. Sometimes, for instance, in cryptomnesia, something creeps up into consciousness; you catch a word which gives you a suggestion, but it is always something that is unconscious until the moment it appears, and so presents itself as if it had fallen from heaven. The Germans call this an *Einfall*, which means a thing which falls into your head from nowhere. Sometimes it is like a revelation. Actually, intuition is a very natural function, a perfectly normal thing, and it is necessary, too, because it makes up for what you cannot perceive or think or feel because it lacks reality. You see, the past is not real any more and the future is not as real as we think. Therefore we must be very grateful to heaven that we have such a function which gives us a certain light on those things which are round the corners. Doctors, of course, being often presented with the most unheard-of situations, need intuition a great deal. Many a good diagnosis comes from this "very mysterious" function.

[27] Psychological functions are usually controlled by the will, or we hope they are, because we are afraid of everything that moves by itself. When the functions are controlled they can be excluded from use, they can be suppressed, they can be selected, they can be increased in intensity, they can be directed by will-power, by what we call intention. But they also

can function in an involuntary way, that is, they think for you, they feel for you—very often they do this and you cannot even stop them. Or they function unconsciously so that you do not know what they have done, though you might be presented, for instance, with the result of a feeling process which has happened in the unconscious. Afterwards somebody will probably say, “Oh, you were very angry, or you were offended, and therefore you reacted in such and such a way.” Perhaps you are quite unconscious that you have felt in that way, nevertheless it is most probable that you have. Psychological functions, like the sense functions, have their specific energy. You cannot dispose of feeling, or of thinking, or of any of the four functions. No one can say, “I will not think”—he will think inevitably. People cannot say, “I will not feel”—they will feel because the specific energy invested in each function expresses itself and cannot be exchanged for another.

[28] Of course, one has preferences. People who have a good mind prefer to think about things and to adapt by thinking. Other people who have a good feeling function are good social mixers, they have a great sense of values; they are real artists in creating feeling situations and living by feeling situations. Or a man with a keen sense of objective observation will use his sensation chiefly, and so on. The dominating function gives each individual his particular kind of psychology. For example, when a man uses chiefly his intellect, he will be of an unmistakable type, and you can deduce from that fact the condition of his feeling. When thinking is the dominant or superior function, feeling is necessarily in an inferior condition.[12] The same rule applies to the other three functions. But I will show you that with a diagram which will make it clear.

[29] You can make the so-called cross of the functions (Figure 1).

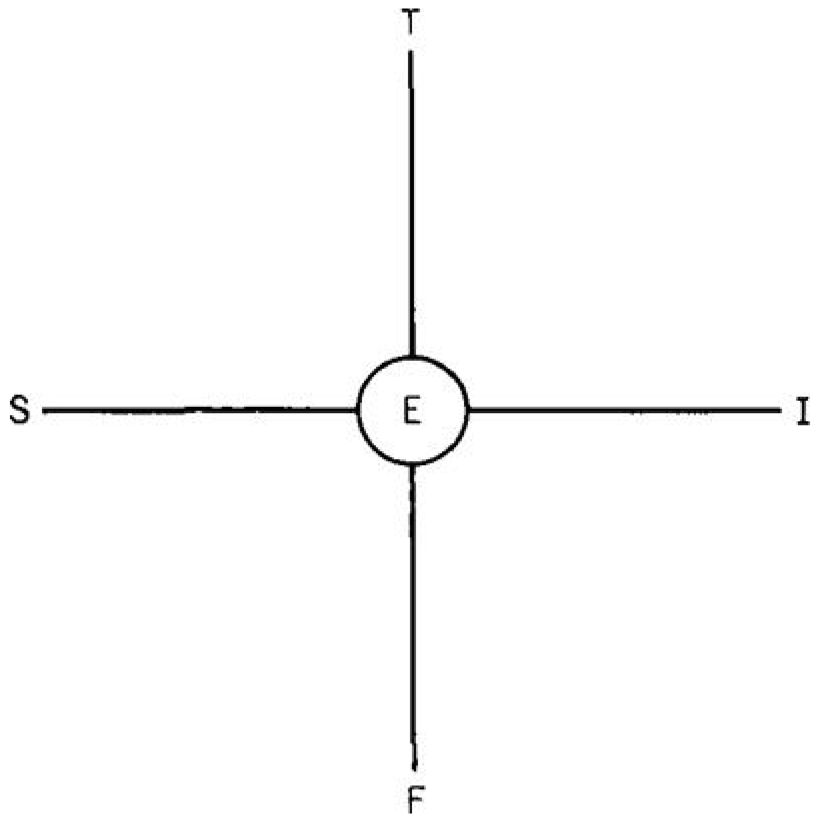

FIG. 1. The Functions

In the centre is the *ego* (E), which has a certain amount of energy at its disposal, and that energy is the will-power. In the case of the thinking type, that will-power can be directed to *thinking* (T). Then we must put *feeling* (F) down below, because it is, in this case, the *inferior function*.[13] That comes from the fact that when you think you must exclude feeling, just as when you feel you must exclude thinking. If you are thinking, leave feeling and feeling-values alone, because feeling is most upsetting to your thoughts. On the other hand people who go by feeling-values leave thinking well alone, and they are right to do so, because these two different functions contradict each other. People have sometimes assured me that their thinking was just as differentiated as their feeling, but I could not believe it, because an individual cannot have the two opposites in the same degree of perfection at the same time.

[30] The same is the case with *sensation* (S) and *intuition* (I). How do they affect each other? When you are observing physical facts you cannot see round corners at the same time. When you observe a man who is working

by his sense function you will see, if you look at him attentively, that the axes of his eyes have a tendency to converge and to come together at one point. When you study the expression or the eyes of intuitive people, you will see that they only glance at things—they do not look, they radiate at things because they take in their fulness, and among the many things they perceive they get one point on the periphery of their field of vision and that is the *hunch*. Often you can tell from the eyes whether people are intuitive or not. When you have an intuitive attitude you usually do not as a rule observe the details. You try always to take in the whole of a situation, and then suddenly something crops up out of this wholeness. When you are a sensation type you will observe facts as they are, but then you have no intuition, simply because the two things cannot be done at the same time. It is too difficult, because the principle of the one function excludes the principle of the other function. That is why I put them here as opposites.

[31] Now, from this simple diagram you can arrive at quite a lot of very important conclusions as to the structure of a given consciousness. For instance, if you find that *thinking* is highly differentiated, then feeling is undifferentiated. What does that mean? Does it mean these people have no feelings? No, on the contrary. They say, "I have very strong feelings. I am full of emotion and temperament." These people are under the sway of their emotions, they are caught by their emotions, they are overcome by their emotions at times. If, for instance, you study the private life of professors it is a very interesting study. If you want to be fully informed as to how the intellectual behaves at home, ask his wife and she will be able to tell you a story!

[32] The reverse is true of the *feeling* type. The feeling type, if he is natural, never allows himself to be disturbed by thinking; but when he gets sophisticated and somewhat neurotic he is disturbed by thoughts. Then thinking appears in a compulsory way, he cannot get away from certain thoughts. He is a very nice chap, but he has extraordinary convictions and ideas, and his thinking is of an inferior kind. He is caught by this thinking, entangled in certain thoughts; he cannot disentangle because he cannot reason, his thoughts are not movable. On the other hand, an intellectual, when caught by his feelings, says, "I feel just like

that," and there is no argument against it. Only when he is thoroughly boiled in his emotion will he come out of it again. He cannot be reasoned out of his feeling, and he would be a very incomplete man if he could.

[33] The same happens with the *sensation* type and the *intuitive* type. The intuitive is always bothered by the reality of things; he fails from the standpoint of realities; he is always out for the possibilities of life. He is the man who plants a field and before the crop is ripe is off again to a new field. He has ploughed fields behind him and new hopes ahead all the time, and nothing comes off. But the sensation type remains with things. He remains in a given reality. To him a thing is true when it is real. Consider what it means to an intuitive when something is real. It is just the wrong thing; it should not be, something else should be. But when a sensation type does not have a given reality—four walls in which to be—he is sick. Give the intuitive type four walls in which to be, and the only thing is how to get out of it, because to him a given situation is a prison which must be undone in the shortest time so that he can be off to new possibilities.

[34] These differences play a very great role in practical psychology. Do not think I am putting people into this box or that and saying, "He is an intuitive," or "He is a thinking type." People often ask me, "Now, is So-and-So not a thinking type?" I say, "I never thought about it," and I did not. It is no use at all putting people into drawers with different labels. But when you have a large empirical material, you need critical principles of order to help you to classify it. I hope I do not exaggerate, but to me it is very important to be able to create a kind of order in my empirical material, particularly when people are troubled and confused or when you have to explain them to somebody else. For instance, if you have to explain a wife to a husband or a husband to a wife, it is often very helpful to have these objective criteria, otherwise the whole thing remains "He said"—"She said."

[35] As a rule, the inferior function does not possess the qualities of a conscious differentiated function. The conscious differentiated function can as a rule be handled by intention and by the will. If you are a real thinker, you can direct your thinking by your will, you can control your

thoughts. You are not the slave of your thoughts, you can think of something else. You can say, “I can think something quite different, I can think the contrary.” But the feeling type can never do that because he cannot get rid of his thought. The thought possesses him, or rather he is possessed by thought. Thought has a fascination for him, therefore he is afraid of it. The intellectual type is afraid of being caught by feeling because his feeling has an archaic quality, and there he is like an archaic man—he is the helpless victim of his emotions. It is for this reason that primitive man is extraordinarily polite, he is very careful not to disturb the feelings of his fellows because it is dangerous to do so. Many of our customs are explained by that archaic politeness. For instance, it is not the custom to shake hands with somebody and keep your left hand in your pocket, or behind your back, because it must be visible that you do not carry a weapon in that hand. The Oriental greeting of bowing with hands extended palms upward means “I have nothing in my hands.” If you kowtow you dip your head to the feet of the other man so that he sees you are absolutely defenceless and that you trust him completely. You can still study the symbolism of manners with primitives, and you can also see why they are afraid of the other fellow. In a similar way, we are afraid of our inferior functions. If you take a typical intellectual who is terribly afraid of falling in love, you will think his fear very foolish. But he is most probably right, because he will very likely make foolish nonsense when he falls in love. He will be caught most certainly, because his feeling only reacts to an archaic or to a dangerous type of woman. This is why many intellectuals are inclined to marry beneath them. They are caught by the landlady perhaps, or by the cook, because they are unaware of their archaic feeling through which they get caught. But they are right to be afraid, because their undoing will be in their feeling. Nobody can attack them in their intellect. There they are strong and can stand alone, but in their feelings they can be influenced, they can be caught, they can be cheated, and they know it. Therefore never force a man into his feeling when he is an intellectual. He controls it with an iron hand because it is very dangerous.

[36] The same law applies to each function. The inferior function is always associated with an archaic personality in ourselves; in the inferior

function we are all primitives. In our differentiated functions we are civilized and we are supposed to have free will; but there is no such thing as free will when it comes to the inferior function. There we have an open wound, or at least an open door through which anything might enter.

[37] Now I am coming to the *endopsychic functions* of consciousness. The functions of which I have just spoken rule or help our conscious orientation in our relations with the environment; but they do not apply to the relation of things that are as it were below the ego. The ego is only a bit of consciousness which floats upon the ocean of the dark things. The dark things are the inner things. On that inner side there is a layer of psychic events that forms a sort of fringe of consciousness round the ego. I will illustrate it by a diagram:

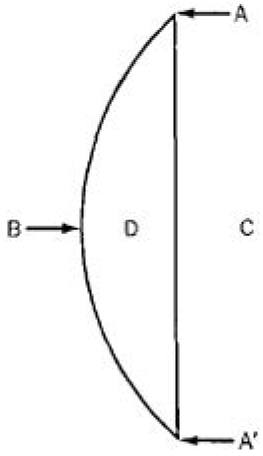

FIG. 2. The Ego

[38] If you suppose AA′ to be the threshold of consciousness, then you would have in D an area of consciousness referring to the ectopsychic world B, the world ruled by those functions of which we were just speaking. But on the other side, in C, is the *shadow-world*. There the ego is somewhat dark, we do not see into it, we are an enigma to ourselves. We only know the ego in D, we do not know it in C. Therefore we are always discovering something new about ourselves. Almost every year something new turns up which we did not know before. We always think we are now at the end of our discoveries. We never are. We go on discovering that we are this, that, and other things, and sometimes we

have astounding experiences. That shows there is always a part of our personality which is still unconscious, which is still becoming: we are unfinished; we are growing and changing. Yet that future personality which we are to be in a year's time is already here only it is still in the shadow. The ego is like a moving frame on a film. The future personality is not yet visible, but we are moving along, and presently we come to view the future being. These potentialities naturally belong to the dark side of the ego. We are well aware of what we have been, but we are not aware of what we are going to be.

[39] Therefore the *first* function on that endopsychic side is *memory*. The function of memory, or reproduction, links us up with things that have faded out of consciousness, things that became subliminal or were cast away or repressed. What we call memory is this faculty to reproduce unconscious contents, and it is the first function we can clearly distinguish in its relationship between our consciousness and the contents that are actually not in view.

[40] The *second* endopsychic function is a more difficult problem. *We* are now getting into deep waters because here we are coming into darkness. I will give you the name first: *the subjective components of conscious functions*. I hope I can make it clear. For instance, when you meet a man you have not seen before, naturally you think something about him. You do not always think things you would be ready to tell him immediately; perhaps you think things that are untrue, that do not really apply. Clearly, they are subjective reactions. The same reactions take place with things and with situations. Every application of a conscious function, whatever the object might be, is always accompanied by subjective reactions which are more or less inadmissible or unjust or inaccurate. You are painfully aware that these things happen in you, but nobody likes to admit that he is subject to such phenomena. He prefers to leave them in the shadow, because that helps him to assume that he is perfectly innocent and very nice and honest and straightforward and "only too willing" etc.,—you know all these phrases. As a matter of fact, one is not. One has any amount of subjective reactions, but it is not quite becoming to admit these things. These reactions I call the subjective components. They are a very important part of our relations to our own inner side. There things

get definitely painful. That is why we dislike entering this shadow-world of the ego. We do not like to look at the shadowside of ourselves; therefore there are many people in our civilized society who have lost their shadow altogether, they have got rid of it. They are only two-dimensional; they have lost the third dimension, and with it they have usually lost the body. The body is a most doubtful friend because it produces things we do not like; there are too many things about the body which cannot be mentioned. The body is very often the personification of this shadow of the ego. Sometimes it forms the skeleton in the cupboard, and everybody naturally wants to get rid of such a thing. I think this makes sufficiently clear what I mean by subjective components. They are usually a sort of disposition to react in a certain way, and usually the disposition is not altogether favourable.

[41] There is one exception to this definition: a person who is not, as we suppose we all are, living on the positive side, putting the right foot forward and not the wrong one, etc. There are certain individuals whom we call in our Swiss dialect "pitch-birds" [*Pechvögel*]; they are always getting into messes, they put their foot in it and always cause trouble, because they *live* their own shadow, they live their own negation. They are the sort of people who come late to a concert or a lecture, and because they are very modest and do not want to disturb other people, they sneak in at the end and then stumble over a chair and make a hideous racket so that everybody has to look at them. Those are the "pitch-birds."

[42] Now we come to the *third* endopsychic component—I cannot say function. In the case of memory you can speak of a function, but even your memory is only to a certain extent a voluntary or controlled function. Very often it is exceedingly tricky; it is like a bad horse that cannot be mastered. It often refuses in the most embarrassing way. All the more is this the case with the subjective components and reactions. And now things begin to get worse, for this is where the *emotions* and *affects* come in. They are clearly not functions any more, they are just events, because in an emotion, as the word denotes, you are moved away, you are cast out, your decent ego is put aside, and something else takes your place. We say, "He is beside himself," or "The devil is riding him,"

or “What has gotten into him today,” because he is like a man who is possessed. The primitive does not say he got angry beyond measure; he says a spirit got into him and changed him completely. Something like that happens with emotions; you are simply possessed, you are no longer yourself, and your control is decreased practically to zero. That is a condition in which the inner side of a man takes hold of him, he cannot prevent it. He can clench his fists, he can keep quiet, but it has him nevertheless.

[43] The *fourth* important endopsychic factor is what I call *invasion*. Here the shadow-side, the unconscious side, has full control so that it can break into the conscious condition. Then the conscious control is at its lowest. Those are the moments in a human life which you do not necessarily call pathological; they are pathological only in the old sense of the word when pathology meant the science of the passions. In that sense you can call them pathological, but it is really an extraordinary condition in which a man is seized upon by his unconscious and when anything may come out of him. One can lose one’s mind in a more or less normal way. For instance, we cannot assume that the cases our ancestors knew very well are abnormal, because they are perfectly normal phenomena among primitives. They speak of the devil or an incubus or a spirit going into a man, or of his soul leaving him, one of his separate souls—they often have as many as six. When his soul leaves him, he is in an altered condition because he is suddenly deprived of himself; he suffers a loss of self. That is a thing you can often observe in neurotic patients. On certain days, or from time to time, they suddenly lose their energy, they lose themselves, and they come under a strange influence. These phenomena are not in themselves pathological; they belong to the ordinary phenomenology of man, but if they become habitual we rightly speak of a neurosis. These are the things that lead to neurosis; but they are also exceptional conditions among normal people. To have overwhelming emotions is not in itself pathological, it is merely undesirable. We need not invent such a word as pathological for an undesirable thing, because there are other undesirable things in the world which are not pathological, for instance, tax-collectors.

Discussion

Dr. J. A. Hadfield:

[44] In what sense do you use the word “emotion”? You used the word “feeling” rather in the sense in which many people here use the word “emotion.” Do you give the term “emotion” a special significance or not?

Professor Jung:

[45] I am glad you have put that question, because there are usually great mistakes and misunderstandings concerning the use of the word emotion. Naturally everybody is free to use words as he likes, but in scientific language you are bound to cling to certain distinctions so that everyone knows what you are talking about. You will remember I explained “feeling” as a function of valuing, and I do not attach any particular significance to feeling. I hold that feeling is a rational function if it is differentiated. When it is not differentiated it just happens, and then it has all the archaic qualities which can be summed up by the word “unreasonable.” But conscious feeling is a rational function of discriminating values.

[46] If you study emotions you will invariably find that you apply the word “emotional” when it concerns a condition that is characterized by physiological innervations. Therefore you can measure emotions to a certain extent, not their psychic part but the physiological part. You know the James-Lange theory of affect.[14] I take emotion as affect, it is the same as “something affects you.” It does something to you—it interferes with you. Emotion is the thing that carries you away. You are thrown out of yourself; you are beside yourself as if an explosion had moved you out of yourself and put you beside yourself. There is a quite tangible physiological condition which can be observed at the same time. So the difference would be this: feeling has no physical or tangible physiological manifestations, while emotion is characterized by an altered physiological condition. You know that the James-Lange theory

of affect says that you only get really emotional when you are aware of the physiological alteration of your general condition. You can observe this when you are in a situation where you would most probably be angry. You know you are going to be angry, and then you feel the blood rushing up into your head, and *then* you are really angry, but not before. Before, you only know you are going to be angry, but when the blood rushes up into your head you are caught by your own anger, immediately the body is affected, and because you realize that you are getting excited, you are twice as angry as you ought to be. Then you are in a real emotion. But when you have *feeling* you have control. You are on top of the situation, and you can say, “I have a very nice feeling or a very bad feeling about it.” Everything is quiet and nothing happens. You can quietly inform somebody, “I hate you,” very nicely. But when you say it spitefully you have an emotion. To say it quietly will not cause an emotion, either in yourself or in the other person. Emotions are most contagious, they are the real carriers of mental contagion. For instance, if you are in a crowd that is in an emotional condition, you cannot help yourself, you are in it too, you are caught by that emotion. But the feelings of other people do not concern you in the least, and for this reason you will observe that the differentiated feeling type usually has a cooling effect upon you, while the emotional person heats you up because the fire is radiating out of him all the time. You see the flame of that emotion in his face. By sympathy your sympathetic system gets disturbed, and you will show very much the same signs after a while. That is not so with feelings. Do I make myself clear?

Dr. Henry V. Dicks:

[47] May I ask, in continuation of that question, what is the relation in your view between affects and feelings?

Professor Jung:

[48] It is a question of degree. If you have a value which is overwhelmingly strong for you it will become an emotion at a certain point, namely, when it reaches such an intensity as to cause a

physiological innervation. All our mental processes probably cause slight physiological disturbances which are so small that we have not the means to demonstrate them. But we have a pretty sensitive method by which to measure emotions, or the physiological part of them, and that is the psychogalvanic effect.[15] It is based on the fact that the electrical resistance of the skin decreases under the influence of emotion. It does not decrease under the influence of feeling.

[49] I will give you an example. I made the following experiment with my former Professor at the Clinic. He functioned as my test partner, and I had him in the laboratory under the apparatus for measuring the psychogalvanic effect. I told him to imagine something which was intensely disagreeable to him but of which he knew I was not aware, something unknown to me yet known to him and exceedingly painful. So he did. He was well acquainted with such experiments and gifted with great power of concentration, so he concentrated on something, and there was almost no visible disturbance of the electrical resistance of the skin; the current did not increase at all. Then I thought I had a hunch. That very morning I had observed certain signs of something going on and I guessed it must be hellishly disagreeable to my chief. So I thought, “I am going to try something.” I simply said to him, “Was not that the case of So-and-So?”—mentioning the name. Instantly there was a deluge of emotion. That was the *emotion;* the former reaction was the *feeling.*

[50] It is a curious fact that hysterical pain does not cause contraction of the pupils, it is not accompanied by physiological innervation, and yet it is an intense pain. But physical pain causes contraction of the pupils. You can have an intense feeling and no physiological alteration; but as soon as you have physiological alteration you are possessed, you are dissociated, thrown out of your own house, and the house is then free for the devils.

Dr. Eric Graham Howe:

[51] Could we equate emotion and feeling with conation and cognition respectively? Whereas feeling corresponds to cognition, emotion is conative.

Professor Jung:

[52] Yes, one could say that in philosophical terminology. I have no objection.

Dr. Howe:

[53] May I have another shot? Your classification into four functions, namely those of sensation, thinking, feeling, and intuition, seems to me to correspond with the one-, two-, three-, and four-dimensional classification. You yourself used the word "three-dimensional" referring to the human body, and you also said that intuition differed from the other three in that it was the function which included Time. Perhaps, therefore, it corresponds to a fourth dimension? In that case, I suggest that "sensation" corresponds with one-dimensional, "perceptual cognition" with two-dimensional, "conceptual cognition" (which would correspond perhaps with your "feeling") with three-dimensional, and "intuition" with four-dimensional on this system of classification.

Professor Jung:

[54] You can put it like that. Since intuition sometimes seems to function as if there were no space, and sometimes as if there were no time, you might say that I add a sort of fourth dimension. But one should not go too far. The concept of the fourth dimension does not produce facts. Intuition is something like H. G. Wells's Time Machine. You remember the time machine, that peculiar motor, which when you sit on it moves off with you into time instead of into space. It consists of four columns, three of which are always visible, but the fourth is visible only indistinctly because it represents the time element. I am sorry but the awkward fact is that intuition is something like this fourth column. There is such a thing as unconscious perception, or perception by ways which are unconscious to us. We have the empirical material to prove the existence of this function. I am sorry that there are such things. My intellect would wish for a clear-cut universe with no dim corners, but there are these cobwebs in the cosmos. Nevertheless I do not think there is anything mystical

about intuition. Can you explain beyond any possibility of doubt why, for instance, some birds travel enormous distances, or the doings of caterpillars, butterflies, ants, or termites? There you have to deal with quite a number of questions. Or take the fact of water having the greatest density at 4° Centigrade. Why such a thing? Why has energy a limitation to quantum? Well, it has, and that is awkward; it is not right that such things should be, but they are. It is exactly like the old question, "Why has God made flies?"—He just has.

Dr. Wilfred R. Bion:

[55] In your experiment why did you ask the Professor to think of an experience which was painful to himself and unknown to you? Do you think there is any significance in the fact that he knew you knew of the unpleasant experience in the second experiment and that this had some bearing on the difference of emotional reaction which he showed in the two examples you gave?

Professor Jung:

[56] Yes, absolutely. My idea was based on the fact that when I know that my partner does not know, it is far more agreeable to me; but when I know that he knows too, it is a very different thing and is very disagreeable. In any doctor's life there are cases which are more or less painful when a colleague knows about them, and I knew almost for a certainty that if I gave him a hint that I knew, he would jump like a mine, and he did. That was my reason.

Dr. Eric B. Strauss:

[57] Would Dr. Jung make clearer what he means when he says that feeling is a rational function? Further, I do not quite understand what Dr. Jung means by feeling. Most of us when we employ the term feeling understand polarities such as pleasure, pain, tension, and relaxation. Further, Dr. Jung claims that the distinction between feelings and emotions is only one of degree. If the distinction is only one of degree, how is it that he puts them on different sides of the frontier, so to speak?

Still further, Dr. Jung claims that one of the criteria or the chief criterion would be that feelings are unaccompanied by physiological change, whereas emotions are accompanied by such changes. Experiments conducted by Professor Freudlicher[16] in Berlin have, I think, shown clearly that simple feelings, in the sense of pleasure, pain, tension, and relaxation, are as a matter of fact accompanied by physiological changes, such as changes in the blood pressure, which can now be recorded by very accurate apparatus.

Professor Jung:

[58] It is true that feelings, if they have an emotional character, are accompanied by physiological effects; but there are definitely feelings which do not change the physiological condition. These feelings are very mental, they are not of an emotional nature. That is the distinction I make. Inasmuch as feeling is a function of values, you will readily understand that this is not a physiological condition. It can be something as abstract as abstract thinking. You would not expect abstract thinking to be a physiological condition. Abstract thinking is what the term denotes. Differentiated thinking is rational; and so feeling can be rational in spite of the fact that many people mix up the terminology.

[59] We must have a word for the giving of values. We must designate that particular function, as apart from others, and feeling is an apt term. Of course, you can choose any other word you like, only you must say so. I have absolutely no objection if the majority of thinking people come to the conclusion that feeling is a very bad word for it. If you say, “We prefer to use another term,” then you must choose another term to designate the function of valuing, because the fact of values remains and we must have a name for it. Usually the sense of values is expressed by the term “feeling.” But I do not cling to the term at all. I am absolutely liberal as to terms, only I give the definition of terms so that I can say what I mean when I use such and such a term. If anybody says that feeling is an emotion or that feeling is a thing that causes heightened blood pressure, I have no objection. I only say that I do not use the word in that sense. If people should agree that it ought to be forbidden to use

the word feeling in such a way as I do, I have no objection. The Germans have the words *Empfindung* and *Gefühl*. When you read Goethe or Schiller you find that even the poets mix up the two functions. German psychologists have already recommended the suppression of the word *Empfindung* for feeling, and propose that one should use the word *Gefühl* (feeling) for values, while the word *Empfindung* should be used for sensation. No psychologist nowadays would say, “The feelings of my eyes or of my ears or of my skin.” People of course say that they have feelings in their big toe or ear, but no scientific language of that kind is possible any more. Taking those two words as identical, one could express the most exalted moods by the word *Empfindung*, but it is exactly as if a Frenchman spoke of “les sensations les plus nobles de l’amour.” People would laugh, you know. It would be absolutely impossible, shocking!

Dr. E. A. Bennet:

[60] Do you consider that the superior function in the case of a person suffering from manic-depression remains conscious during the period of depression?

Professor Jung:

[61] I would not say that. If you consider the case of manic-depressive insanity you occasionally find that in the manic phase one function prevails and in the depressive phase another function prevails. For instance, people who are lively, sanguine, nice and kind in the manic phase, and do not think very much, suddenly become very thoughtful when the depression comes on, and then they have obsessive thoughts, and vice versa. I know several cases of intellectuals who have a manic-depressive disposition. In the manic phase they think freely, they are productive and very clear and very abstract. Then the depressive phase comes on, and they have obsessive feelings; they are obsessed by terrible moods, just moods, not thoughts. Those are, of course, psychological details. You see these things most clearly in cases of men of forty and a little bit more who have led a particular type of life, an intellectual life or

a life of values, and suddenly that thing goes under and up comes just the contrary. There are very interesting cases like that. We have the famous literary illustrations, Nietzsche for instance. He is a most impressive example of a change of psychology into its opposite at middle age. In younger years he was the aphorist in the French style; in later years, at 38, in *Thus Spake Zarathustra*, he burst out in a Dionysian mood which was absolutely the contrary of everything he had written before.

Dr. Bennet:

[62] Is melancholia not extraverted?

Professor Jung:

[63] You cannot say that, because it is an incommensurable consideration. Melancholia in itself could be termed an introverted condition but it is not an attitude of preference. When you call somebody an introvert, you mean that he prefers an introverted habit, but he has his extraverted side too. We all have both sides, otherwise we could not adapt at all, we would have no influence, we would be beside ourselves. Depression is always an introverted condition. Melancholies sink down into a sort of embryonic condition, therefore you find that accumulation of peculiar physical symptoms.

Dr. Mary C. Luff:

[64] As Professor Jung has explained emotion as an obsessive thing which possesses the individual, I am not clear how he differentiates what he calls “invasions” from “affects.”

Professor Jung:

[65] You experience sometimes what you call “pathological” emotions, and there you observe most peculiar contents coming through as emotion: thoughts you have never thought before, sometimes terrible thoughts and fantasies. For instance, some people when they are very angry, instead of having the ordinary feelings of revenge and so on, have

the most terrific fantasies of committing murder, cutting off the arms and legs of the enemy, and such things. Those are invading fragments of the unconscious, and if you take a fully developed pathological emotion it is really a state of *eclipse* of consciousness when people are raving mad for a while and do perfectly crazy things. That is an invasion. That would be a pathological case, but fantasies of this kind can also occur within the limits of normal. I have heard innocent people say, "I could cut him limb from limb," and they actually do have these bloody fantasies; they would "smash the brains" of people, they imagine *doing* what in cold blood is merely *said* as a metaphor. When these fantasies get vivid and people are afraid of themselves, you speak of invasion.

Dr. Luff:

[66] Is that what you call confusional psychosis?

Professor Jung:

[67] It does not need to be a psychosis at all. It does not need to be pathological; you can observe such things in normal people when they are under the sway of a particular emotion. I once went through a very strong earthquake. It was the first time in my life I experienced an earthquake. I was simply overcome by the idea that the earth was not solid and that it was the skin of a huge animal that had shaken itself as a horse does. I was simply caught by that idea for a while. Then I came out of the fantasy remembering that that is exactly what the Japanese say about earthquakes: that the big salamander has turned over or changed its position, the salamander that is carrying the earth.[17] Then I was satisfied that it was an archaic idea which had jumped into my consciousness. I thought it was remarkable; I did not quite think it was pathological.

Dr. B. D. Hendy:

[68] Would Professor Jung say that affect, as he defined it, is *caused* by a characteristic physiological condition, or would he say that this physiological alteration is the *result* of, let us say, invasion?

Professor Jung:

[69] The relation between body and mind is a very difficult question. You know that the James-Lange theory says that affect is the result of physiological alteration. The question whether the body or the mind is the predominating factor will always be answered according to temperamental differences. Those who by temperament prefer the theory of the supremacy of the body will say that mental processes are epiphenomena of physiological chemistry. Those who believe more in the spirit will say the contrary, to them the body is just the appendix of the mind and causation lies with the spirit. It is really a philosophical question, and since I am not a philosopher I cannot claim to make a decision. All we can know empirically is that processes of the body and processes of the mind happen together in some way which is mysterious to us. It is due to our most lamentable mind that we cannot think of body and mind as one and the same thing; probably they *are* one thing, but we are unable to think it. Modern physics is subject to the same difficulty; look at the regrettable things which happen with light! Light behaves as if it were oscillations, and it also behaves as if it were "corpuscles." It needed a very complicated mathematical formula by M. de Broglie to help the human mind to conceive the possibility that oscillations and corpuscles are two phenomena, observed under different conditions, of one and the same ultimate reality.[18] You cannot *think* this, but you are forced to admit it as a postulate.

[70] In the same way, the so-called psychophysical parallelism is an insoluble problem. Take for instance the case of typhoid fever with psychological concomitants. If the psychic factor were mistaken for a causation, you would reach preposterous conclusions. All we can say is that there are certain physiological conditions which are clearly caused by mental disorder, and certain others which are not caused but merely accompanied by psychic processes. Body and mind are the two aspects of the living being, and that is all we know. Therefore I prefer to say that the two things happen together in a miraculous way, and we had better leave it at that, because we cannot think of them together. For my own use I have coined a term to illustrate this being together; I say there is a

peculiar principle of *synchronicity*[19] active in the world so that things happen together somehow and behave as if they were the same, and yet for us they are not. Perhaps we shall some day discover a new kind of mathematical method by which we can prove that it must be like that. But for the time being I am absolutely unable to tell you whether it is the body or the mind that prevails, or whether they just coexist.

Dr. L. J. Bendit:

[71] I am not quite clear when invasion becomes pathological. You suggested in the first part of your talk this evening that invasion became pathological whenever it became habitual. What is the difference between a pathological invasion and an artistic inspiration and creation of ideas?

Professor Jung:

[72] Between an artistic inspiration and an invasion there is absolutely no difference. It is exactly the same, therefore I avoid the word "pathological." I would never say that artistic inspiration is pathological, and therefore I make that exception for invasions too, because I consider that an inspiration is a perfectly normal fact. There is nothing bad in it. It is nothing out of the ordinary. Happily enough it belongs to the order of human beings that inspiration takes place occasionally—very rarely, but it does. But it is quite certain that pathological things come in pretty much the same way, so we have to draw the line somewhere. If you are all alienists and I present to you a certain case, then you might say that that man is insane. I would say that that man is not insane for this reason, that as long as he can explain himself to me in such a way that I feel I have a contact with him that man is not crazy. To be crazy is a very relative conception. For instance, when a Negro behaves in a certain way we say, "Oh well, he's only a Negro," but if a white man behaves in the same way we say, "That man is crazy," because a white man cannot behave like that. A Negro is expected to do such things but a white man does not do them. To be "crazy" is a social concept; we use social restrictions and definitions in order to distinguish mental disturbances.

You can say that a man is peculiar, that he behaves in an unexpected way and has funny ideas, and if he happens to live in a little town in France or Switzerland you would say, “He is an original fellow, one of the most original inhabitants of that little place”; but if you bring that man into the midst of Harley Street, well, he is plumb crazy. Or if a certain individual is a painter, you think he is a very original artist, but let that man be the cashier of a big bank and the bank will experience something. Then they will say that fellow is surely crazy. But these are simply social considerations. We see the same thing in lunatic asylums. It is not an absolute increase in insanity that makes our asylums swell like monsters, it is the fact that we cannot stand abnormal people any more, so there are apparently very many more crazy people than formerly. I remember in my youth we had people whom I recognized later on as being schizophrenic, and we thought, “Well, Uncle So-and-So is a very original man.” In my native town we had some imbeciles, but one did not say, “He is a terrible ass,” or something like that, but “He is very nice.” In the same way one called certain idiots “cretins,” which comes from the saying “il est bon chrétien.” You could not say anything else of them, but at least they were good Christians.

The Chairman:

[73] Ladies and Gentlemen, I think we must let Professor Jung off any further activity for tonight, and we thank him very much indeed.

LECTURE II

The Chairman (Dr. J. A. Hadfield):

[74] Ladies and Gentlemen, you have already been introduced to Dr. Jung and that in the most eulogistic language, but I think all who were here last night will recognize that even such a great eulogy was in no sense exaggerated. Dr. Jung last night was referring to a number of the functions of the human mind, such as feeling, thinking, intuition, and sensation, and I could not help feeling that in him all these functions, contrary to what he told us, seemed to be very well differentiated. I also had a hunch that in him they were bound together in the centre by a sense of humour. Nothing convinces me so much of the truth of any conception as when its creator is able to see it as a subject of humour, and that is what Dr. Jung did last night. Over-seriousness in regard to any subject very often displays the fact that the individual is dubious and anxious about the truth of what he is trying to convey.

Professor Jung:

[75] Ladies and Gentlemen, yesterday we dealt with the functions of consciousness. Today I want to finish the problem of the structure of the mind. A discussion of the human mind would not be complete if we did not include the existence of unconscious processes. Let me repeat shortly the reflections which I made last night.

[76] We cannot deal with unconscious processes directly because they are not reachable. They are not directly apprehended; they appear only in their products, and we postulate from the peculiar quality of those products that there must be something behind them from which they originate. We call that dark sphere the unconscious psyche.

[77] The ectopsychic contents of consciousness derive in the first place from the environment, through the data of the senses.

Then the contents also come from other sources, such as memory and processes of judgment. These belong to the endopsychic sphere. A third source for conscious contents is the dark sphere of the mind, the unconscious. We approach it through the peculiarities of the endopsychic functions, those functions which are not under the control of the will. They are the vehicle by which unconscious contents reach the surface of consciousness.

[78] The unconscious processes, then, are not directly observable, but those of its products that cross the threshold of consciousness can be divided into two classes. The first class contains recognizable material of a definitely personal origin; these contents are individual acquisitions or products of instinctive processes that make up the personality as a whole. Furthermore, there are forgotten or repressed contents, and creative contents. There is nothing specially peculiar about them. In other people such things may be conscious. Some people are conscious of things of which other people are not. I call that class of contents the subconscious mind or the *personal unconscious*, because, as far as we can judge, it is entirely made up of personal elements, elements that constitute the human personality as a whole.

[79] Then there is another class of contents of definitely unknown origin, or at all events of an origin which cannot be ascribed to individual acquisition. These contents have one outstanding peculiarity, and that is their mythological character. It is as if they belong to a pattern not peculiar to any particular mind or person, but rather to a pattern peculiar to *mankind in general*. When I first came across such contents I wondered very much whether they might not be due to heredity, and I thought they might be explained by racial inheritance. In order to settle that question I went to the United States and studied the dreams of pure-blooded Negroes, and I was able to satisfy myself that these images have nothing to do with so-called blood or racial inheritance, nor are they personally acquired by the individual. They belong to mankind in general, and therefore they are of a *collective* nature.

[80] These collective patterns I have called *archetypes*, using an expression of St. Augustine's.[1] An archetype means a *typos* [imprint], a

definite grouping of archaic character containing, in form as well as in meaning, *mythological motifs*. Mythological motifs appear in pure form in fairytales, myths, legends, and folklore. Some of the well-known motifs are: the figures of the Hero, the Redeemer, the Dragon (always connected with the Hero, who has to overcome him), the Whale or the Monster who swallows the Hero.[2] Another variation of the motif of the Hero and the Dragon is the Katabasis, the Descent into the Cave, the Nekyia. You remember in the Odyssey where Ulysses descends *ad inferos* to consult Tiresias, the seer. This motif of the Nekyia is found everywhere in antiquity and practically all over the world. It expresses the psychological mechanism of introversion of the conscious mind into the deeper layers of the unconscious psyche. From these layers derive the contents of an impersonal, mythological character, in other words, the archetypes, and I call them therefore the impersonal or *collective unconscious.*

[81] I am perfectly well aware that I can give you only the barest outline of this particular question of the collective unconscious. But I will give you an example of its symbolism and of how I proceed in order to discriminate it from the personal unconscious. When I went to America to investigate the unconscious of Negroes I had in mind this particular problem: are these collective patterns racially inherited, or are they "a priori categories of imagination," as two Frenchmen, Hubert and Mauss,[3] quite independently of my own work, have called them. A Negro told me a dream in which occurred the figure of a man crucified on a wheel.[4] I will not mention the whole dream because it does not matter. It contained of course its personal meaning as well as allusions to impersonal ideas, but I picked out only that one motif. He was a very uneducated Negro from the South and not particularly intelligent. It would have been most probable, given the well-known religious character of the Negroes, that he should dream of a man crucified on a *cross*. The cross would have been a personal acquisition. But it is rather improbable that he should dream of the man crucified on a *wheel*. That is a very uncommon image. Of course I cannot prove to you that by some curious chance the Negro had not seen a picture or heard something of the sort and then dreamt about it; but if he had not had any model for this idea it would be an

archetypal image, because the crucifixion on the wheel is a *mythological motif*. It is the ancient sun-wheel, and the crucifixion is the sacrifice to the sun-god in order to propitiate him, just as human and animal sacrifices formerly were offered for the fertility of the earth. The sun-wheel is an exceedingly archaic idea, perhaps the oldest religious idea there is. We can trace it to the Mesolithic and Paleolithic ages, as the sculptures of Rhodesia prove. Now there were real wheels only in the Bronze Age; in the Paleolithic Age the wheel was not yet invented. The Rhodesian sun-wheel seems to be contemporary with very naturalistic animal-pictures, like the famous rhino with the tick-birds, a masterpiece of observation. The Rhodesian sun-wheel is therefore an original vision, presumably an archetypal sun-image.[5] But this image is not a naturalistic one, for it is always divided into four or eight partitions (Figure 3). This image, a sort of divided circle, is a symbol which you find throughout the whole history of mankind as well as in the dreams of modern individuals. We might assume that the invention of the actual wheel started from this vision. Many of our inventions came from mythological anticipations and primordial images. For instance, the art of alchemy is the mother of modern chemistry. Our conscious scientific mind started in the matrix of the unconscious mind.

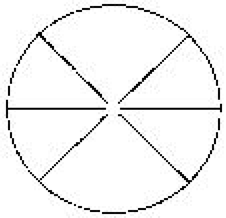

FIG. 3. Sun-wheel

[82] In the dream of the Negro, the man on the wheel is a repetition of the Greek mythological motif of Ixion, who, on account of his offence against men and gods, was fastened by Zeus upon an incessantly turning wheel. I give you this example of a mythological motif in a dream merely in order to convey to you an idea of the collective unconscious. One single example is of course no conclusive proof. But one cannot very well assume that this Negro had studied Greek mythology, and it is

improbable that he had seen any representation of Greek mythological figures. Furthermore, figures of Ixion are pretty rare.

[83] I could give you conclusive proof of a very elaborate kind of the existence of these mythological patterns in the unconscious mind. But in order to present my material I should need to lecture for a fortnight. I would have first to explain to you the meaning of dreams and dream-series and then give you all the historical parallels and explain fully their importance, because the symbolism of these images and ideas is not taught in public schools or universities, and even specialists very rarely know of it. I had to study it for years and to find the material myself, and I cannot expect even a highly educated audience to be *au courant* with such abstruse matters. When we come to the technique of dream-analysis I shall be forced to enter into some of the mythological material and you will get a glimpse of what this work of finding parallels to unconscious products is really like. For the moment I have to content myself with the mere statement that there are mythological patterns in that layer of the unconscious, that it produces contents which cannot be ascribed to the individual and which may even be in strict contradiction to the personal psychology of the dreamer. For instance, you are simply astounded when you observe a completely uneducated person producing a dream which really should not occur with such a person because it contains the most amazing things. And children’s dreams often make you think to such a degree that you must take a holiday afterwards in order to recover from the shock, because these symbols are so tremendously profound and you think: How on earth is it possible that a child should have such a dream?

[84] It is really quite simple to explain. Our mind has its history, just as our body has its history. You might be just as astonished that man has an appendix, for instance. Does he know he ought to have an appendix? He is just born with it. Millions of people do not know they have a thymus, but they have it. They do not know that in certain parts of their anatomy they belong to the species of the fishes, and yet it is so. Our unconscious mind, like our body, is a storehouse of relics and memories of the past. A study of the structure of the unconscious collective mind would reveal the same discoveries as you make in comparative anatomy. We do not need to think that there is anything mystical about it. But because I speak

of a collective unconscious, I have been accused of obscurantism. There is nothing mystical about the collective unconscious. It is just a new branch of science, and it is really common sense to admit the existence of unconscious collective processes. For, though a child is not born conscious, his mind is not a *tabula rasa*. The child is born with a definite brain, and the brain of an English child will work not like that of an Australian blackfellow but in the way of a modern English person. The brain is born with a finished structure, it will work in a modern way, but this brain has its history. It has been built up in the course of millions of years and represents a history of which it is the result. Naturally it carries with it the traces of that history, exactly like the body, and if you grope down into the basic structure of the mind you naturally find traces of the archaic mind.

[85] The idea of the collective unconscious is really very simple. If it were not so, then one could speak of a miracle, and I am not a miracle-monger at all. I simply go by experience. If I could tell you the experiences you would draw the same conclusions about these archaic motifs. By chance, I stumbled somehow into mythology and have read more books perhaps than you. I have not always been a student of mythology. One day, when I was still at the clinic, I saw a patient with schizophrenia who had a peculiar vision, and he told me about it. He wanted me to see it and, being very dull, I could not see it. I thought, “This man is crazy and I am normal and his vision should not bother me.” But it did. I asked myself: What does it mean? I was not satisfied that it was just crazy, and later I came on a book by a German scholar, Dieterich,[6] who had published part of a magic papyrus. I studied it with great interest, and on page 7 I found the vision of my lunatic “word for word.” That gave me a shock. I said: “How on earth is it possible that this fellow came into possession of that vision?” It was not just one image, but a series of images and a literal repetition of them. I do not want to go into it now because it would lead us too far. It is a highly interesting case; as a matter of fact, I published it.[7]

[86] This astonishing parallelism set me going. You probably have not come across the book of the learned professor Dieterich, but if you had

read the same books and observed such cases you would have discovered the idea of the collective unconscious.

[87] The deepest we can reach in our exploration of the unconscious mind is the layer where man is no longer a distinct individual, but where his mind widens out and merges into the mind of mankind—not the conscious mind, but the unconscious mind of mankind, where we are all the same. As the body has its anatomical conformity in its two eyes and two ears and one heart and so on, with only slight individual differences, so has the mind its basic conformity. On this collective level we are no longer separate individuals, we are all one. You can understand this when you study the psychology of primitives. The outstanding fact about the primitive mentality is this lack of distinctiveness between individuals, this oneness of the subject with the object, this *participation mystique*, as Lévy-Bruhl[8] terms it. Primitive mentality expresses the basic structure of the mind, that psychological layer which with us is the collective unconscious, that underlying level which is the same in all. Because the basic structure of the mind is the same in everybody, we cannot make distinctions when we experience on that level. There we do not know if something has happened to you or to me. In the underlying collective level there is a wholeness which cannot be dissected. If you begin to think about participation as a fact which means that fundamentally we are identical with everybody and everything, you are led to very peculiar theoretical conclusions. You should not go further than those conclusions because these things get dangerous. But some of the conclusions you should explore, because they can explain a lot of peculiar things that happen to man.

[88] I want to sum up: I have brought a diagram (Figure 4). It looks very complicated but as a matter of fact it is very simple. Suppose our mental sphere to look like a lighted globe. The surface from which the light emanates is the function by which you chiefly adapt. If you are a person who adapts chiefly by thinking, your surface is the surface of a thinking man. You will tackle things with your thinking, and what you will show to people will be your thinking. It will be another function if you are of another type.[9]

[89] In the diagram, *sensation* is given as the peripheral function. By it man gets information from the world of external objects. In the second circle, *thinking*, he gets what his senses have told him; he will give things a name. Then he will have a *feeling* about them; a feeling-tone will accompany his observation. And in the end he will get some consciousness of where a thing comes from, where it may go, and what it may do. That is *intuition*, by which you see round corners. These four functions form the ectopsychic system.

[90] The next circle in the diagram represents the conscious ego-complex to which the functions refer. Inside the endopsyche you first notice *memory*, which is still a function that can be controlled by the will; it is under the control of your ego-complex. Then we meet the *subjective components of the functions*. They cannot be exactly directed by the will but they still can be suppressed, excluded, or increased in intensity by will-power. These components are no longer as controllable as memory, though even memory is a bit tricky as you know. Then we come to the *affects* and *invasions*, which are only controllable by sheer force. You can suppress them, and that is all you can do. You have to clench your fists in order not to explode, because they are apt to be stronger than your ego-complex.

[91] This psychic system cannot really be expressed by such a crude diagram. The diagram is rather a scale of values showing how the energy or intensity of the ego-complex which manifests itself in will-power gradually decreases as you approach the darkness that is ultimately at the bottom of the whole structure—the *unconscious*. First we have the personal subconscious mind. The *personal unconscious* is that part of the psyche which contains all the things that could just as well be conscious. You know that many things are termed unconscious, but that is only a relative statement. There is nothing in this particular sphere that is necessarily unconscious in everybody. There are people who are conscious of almost anything of which man can be conscious. Of course we have an extraordinary amount of unconsciousness in our civilization, but if you go to other races, to India or to China, for example, you discover that these people are conscious of things for which the psychoanalyst in our countries has to dig for months. Moreover, simple

people in natural conditions often have an extraordinary consciousness of things of which people in towns have no knowledge and of which townspeople begin to dream only under the influence of psychoanalysis. I noticed this at school. I had lived in the country among peasants and with animals, and I was fully conscious of a number of things of which other boys had no idea. I had the chance and I was not prejudiced. When you analyse dreams or symptoms or fantasies of neurotic or normal people, you begin to penetrate the unconscious mind, and you can abolish its artificial threshold. The personal unconscious is really something very relative, and its circle can be restricted and become so much narrower that it touches zero. It is quite thinkable that a man can develop his consciousness to such an extent that he can say: *Nihil humanum a me alienum puto.*[10]

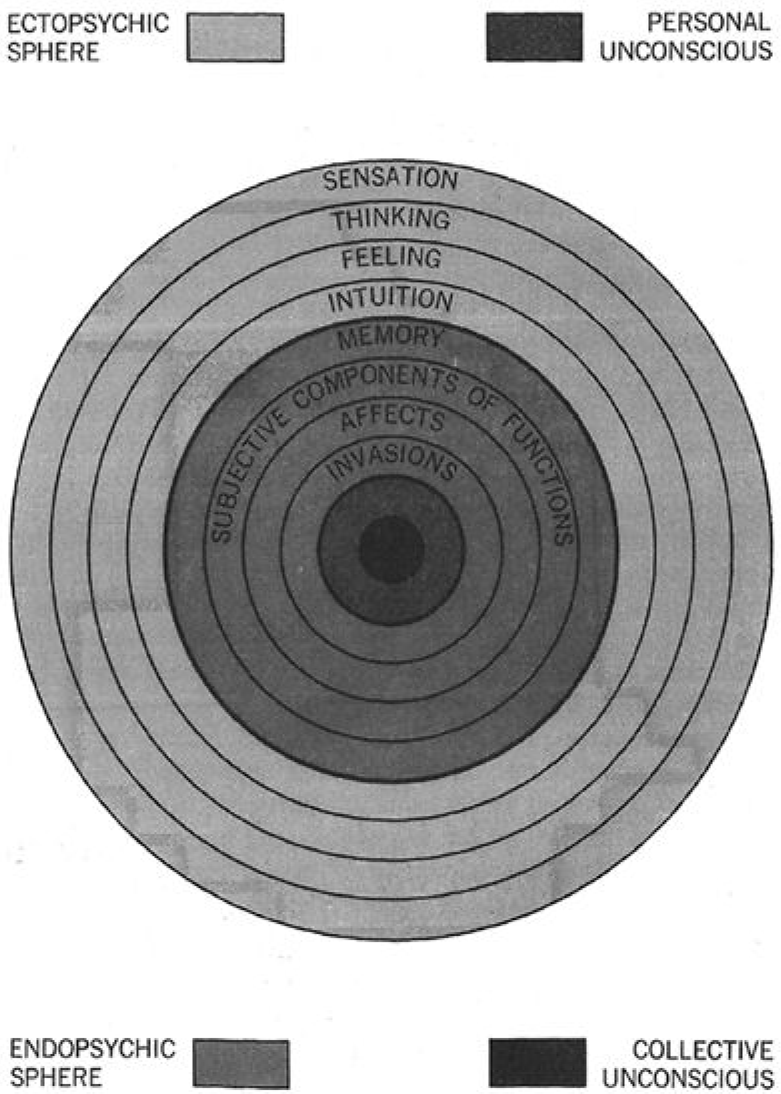

FIG. 4. The Psyche

[92] Finally we come to the ultimate kernel which cannot be made conscious at all—the sphere of the archetypal mind. Its presumable contents appear in the form of images which can be understood only by comparing them with historical parallels. If you do not recognize certain material as historical, and if you do not possess the parallels, you cannot integrate these contents into consciousness and they remain projected. The contents of the *collective unconscious* are not subject to any arbitrary intention and are not controllable by the will. They actually behave as if they did not exist in yourself—you see them in your neighbours but not in yourself. When the contents of the collective unconscious become

activated, we become aware of certain things in our fellow men. For instance, we begin to discover that the bad Abyssinians are attacking Italy. You know the famous story by Anatole France. Two peasants were always fighting each other, and there was somebody who wanted to go into the reasons for it, and he asked one man, “Why do you hate your neighbour and fight him like this?” He replied, “Mais il est de l’autre côté de la rivière!” That is like France and Germany. We Swiss people, you know, had a very good chance during the Great War to read newspapers and to study that particular mechanism which behaved like a great gun firing on one side of the Rhine and in exactly the same way on the other side, and it was very clear that people saw in their neighbours the thing they did not recognize in themselves.

[93] As a rule, when the collective unconscious becomes really constellated in larger social groups, the result is a public craze, a mental epidemic that may lead to revolution or war or something of the sort. These movements are exceedingly contagious—almost overwhelmingly contagious because, when the collective unconscious is activated, you are no longer the same person. You are not only in the movement—you *are* it. If you lived in Germany or were there for a while, you would defend yourself in vain. It gets under your skin. You are human, and wherever you are in the world you can defend yourself only by restricting your consciousness and making yourself as empty, as soulless, as possible. Then you lose your soul, because you are only a speck of consciousness floating on a sea of life in which you do not participate. But if you remain yourself you will notice that the collective atmosphere gets under your skin. You cannot live in Africa or any such country without having that country under your skin. If you live with the yellow man you get yellow under the skin. You cannot prevent it, because somewhere you are the same as the Negro or the Chinese or whoever you live with, you are all just human beings. In the collective unconscious you are the same as a man of another race, you have the same archetypes, just as you have, like him, eyes, a heart, a liver, and so on. It does not matter that his skin is black. It matters to a certain extent, sure enough—he has probably a whole historical layer less than you. The different strata of the mind correspond to the history of the races.

[94] If you study races as I have done you can make very interesting discoveries. You can make them, for instance, if you analyse North Americans. The American, on account of the fact that he lives on virgin soil, has the Red Indian in him. The Red man, even if he has never seen one, and the Negro, though he may be cast out and the tram-cars reserved for white men only, have got into the American and you will realize that he belongs to a partly coloured nation.[11] These things are wholly unconscious, and you can only talk to very enlightened people about them. It is just as difficult to talk to Frenchmen or Germans when you have to tell them why they are so much against each other.

[95] A little while ago I had a nice evening in Paris. Some very cultivated men had invited me, and we had a pleasant conversation. They asked me about national differences, and I thought I would put my foot in it, so I said: “What you value is *la clarté latine, la clarté de l’esprit latin*. That is because your thinking is inferior. The Latin thinker is inferior in comparison to the German thinker.” They cocked their ears, and I said: “But your feeling is unsurpassable, it is absolutely differentiated.” They said: “How is that?” I replied: “Go to a café or a vaudeville or a place where you hear songs and stage-plays and you will notice a very peculiar phenomenon. There are any number of very grotesque and cynical things and then suddenly something sentimental happens. A mother loses her child, there is a lost love, or something marvellously patriotic, and you must weep. For you, the salt and the sugar have to go together. But a German can stand a whole evening of sugar only. The Frenchman must have some salt in it. You meet a man and say: *Enchanté de faire votre connaissance*. You are not *enchanté de faire sa connaissance* at all; you are really feeling: ‘Oh go to the devil.’ But you are not disturbed, nor is he. But do not say to a German: *Enchanté de faire votre connaissance*, because he will believe it. A German will sell you a pair of sock-suspenders and not only expect, as is natural, to be paid for it. He also expects to be loved for it.”

[96] The German nation is characterized by the fact that its feeling function is inferior, it is not differentiated. If you say that to a German he is offended. I should be offended too. He is very attached to what he calls *”Gemütlichkeit.”* A room full of smoke in which everybody loves

everybody—that is *gemütlich* and that must not be disturbed. It has to be absolutely clear, just one note and no more. That is *la clarté germanique du sentiment*, and it is inferior. On the other hand, it is a gross offence to a Frenchman to say something paradoxical, because it is not clear. An English philosopher has said, “A superior mind is never quite clear.” That is true, and also superior feeling is never quite clear. You will only enjoy a feeling that is above board when it is slightly doubtful, and a thought that does not have a slight contradiction in it is not convincing.

[97] Our particular problem from now on will be: How can we approach the dark sphere of man? As I have told you, this is done by three methods of analysis: the word-association test, dream-analysis, and the method of active imagination. First of all I want to say something about *word-association tests*.[12] To many of you perhaps these seem old-fashioned, but since they are still being used I have to refer to them. I use this test now not with patients but with criminal cases.

[98] The experiment is made—I am repeating well-known things—with a list of say a hundred words. You instruct the test person to react with the first word that comes into his mind as quickly as possible after having heard and understood the stimulus word. When you have made sure that the test person has understood what you mean you start the experiment. You mark the time of each reaction with a stop-watch. When you have finished the hundred words you do another experiment. You repeat the stimulus words and the test person has to reproduce his former answers. In certain places his memory fails and reproduction becomes uncertain or faulty. These mistakes are important.

[99] Originally the experiment was not meant for its present application at all; it was intended to be used for the study of mental association. That was of course a most Utopian idea. One can study nothing of the sort by such primitive means. But you can study something else when the experiment fails, when people make mistakes. You ask a simple word that a child can answer, and a highly intelligent person cannot reply. Why? That word has hit on what I call a complex, a conglomeration of psychic contents characterized by a peculiar or perhaps painful feeling-tone, something that is usually hidden from sight. It is as though a

projectile struck through the thick layer of the *persona*[13] into the dark layer. For instance, somebody with a money complex will be hit when you say: “To buy,” “to pay,” or “money.” That is a disturbance of reaction.

[100] We have about twelve or more categories of disturbance and I will mention a few of them so that you will get an idea of their practical value. The prolongation of the reaction time is of the greatest practical importance. You decide whether the reaction time is too long by taking the average mean of the reaction times of the test person. Other characteristic disturbances are: reaction with more than one word, against the instructions; mistakes in reproduction of the word; reaction expressed by facial expression, laughing, movement of the hands or feet or body, coughing, stammering, and such things; insufficient reactions like “yes” or “no”; not reacting to the real meaning of the stimulus word; habitual use of the same words; use of foreign languages—of which there is not a great danger in England, though with us it is a great nuisance; defective reproduction, when memory begins to fail in the reproduction experiment; total lack of reaction.

[101] All these reactions are beyond the control of the will. If you submit to the experiment you are done for, and if you do not submit to it you are done for too, because one knows why you are unwilling to do so. If you put it to a criminal he can refuse, and that is fatal because one knows why he refuses. If he gives in he hangs himself. In Zurich I am called in by the Court when they have a difficult case; I am the last straw.

[102] The results of the association test can be illustrated very neatly by a diagram (Figure 5). The height of the columns represents the actual reaction time of the test person. The dotted horizontal line represents the average mean of reaction times. The unshaded columns are those reactions which show no signs of disturbance. The shaded columns show disturbed reactions. In reactions 7, 8, 9, 10, you observe for instance a whole series of disturbances: the stimulus word at 7 was a critical one, and without the test person noticing it at all three subsequent reaction times are overlong on account of the perseveration of the reaction to the stimulus word. The test person was quite unconscious of the fact that he had an emotion. Reaction 13 shows an isolated disturbance, and in 16–20

the result is again a whole series of disturbances. The strongest disturbances are in reactions 18 and 19. In this particular case we have to do with a so-called intensification of sensitiveness through the sensitizing effect of an unconscious emotion: when a critical stimulus word has aroused a perseverating emotional reaction, and when the next critical stimulus word happens to occur with in the range of that perseveration, then it is apt to produce a greater effect than it would have been expected to produce if it had occurred in a series of indifferent associations. This is called the sensitizing effect of a perseverating emotion.

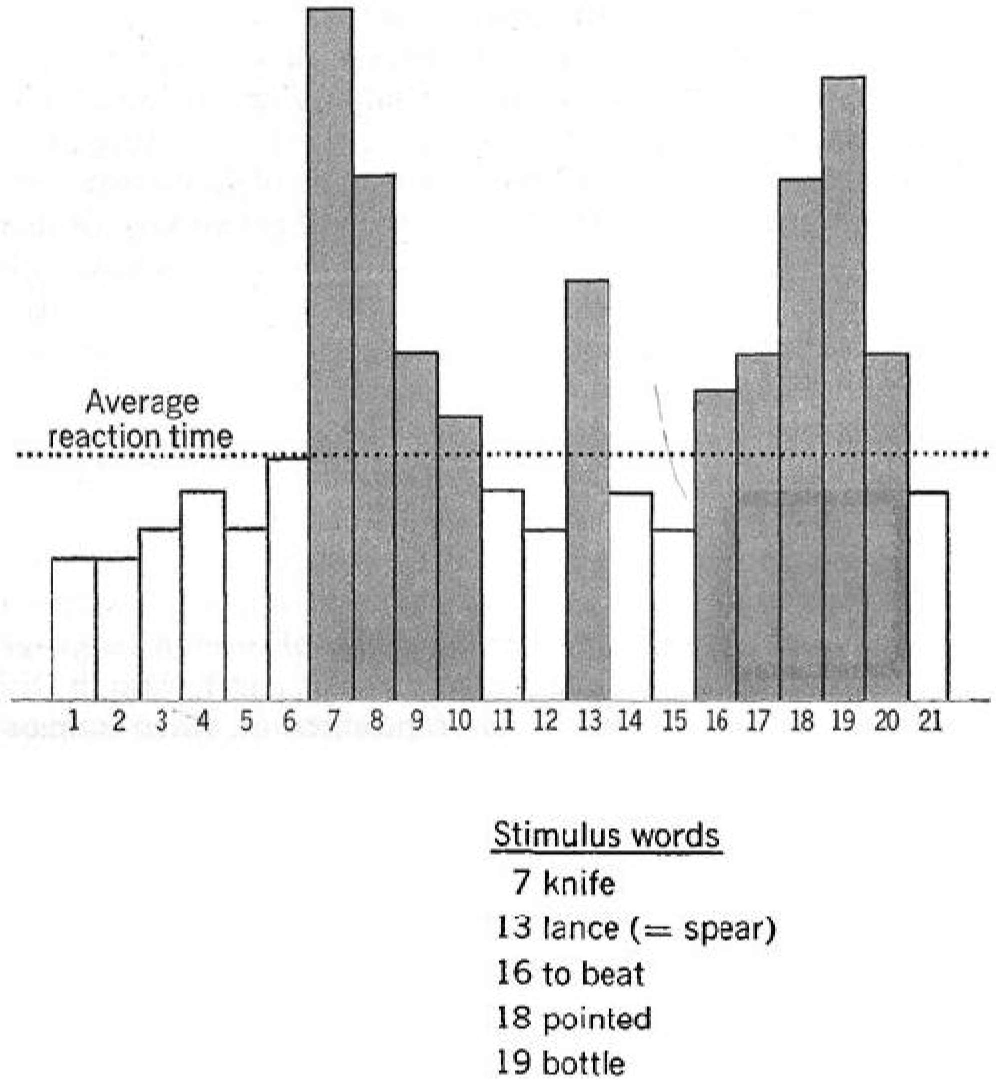

FIG. 5. Association Test

[103] In dealing with criminal cases we can make use of the sensitizing effect, and then we arrange the critical stimulus words in such a way that they occur more or less within the presumable range of perseveration. This can be done in order to increase the effect of critical stimulus words. With a suspected culprit as a test person, the critical stimulus words are words which have a direct bearing upon the crime.

[104] The test person for Figure 5 was a man about 35, a decent individual, one of my normal test persons. I had of course to experiment with a great number of normal people before I could draw conclusions from pathological material. If you want to know what it was that disturbed this man, you simply have to read the words that caused the disturbances and fit them together. Then you get a nice story. I will tell you exactly what it was.

[105] To begin with, it was the word *knife* that caused four disturbed reactions. The next disturbance was *lance* (or *spear*) and then *to beat*, then the word *pointed* and then *bottle*. That was in a short series of fifty stimulus words, which was enough for me to tell the man point-blank what the matter was. So I said: “I did not know you had had such a disagreeable experience.” He stared at me and said: “I do not know what you are talking about.” I said: “You know you were drunk and had a disagreeable affair with sticking your knife into somebody.” He said: “How do you know?” Then he confessed the whole thing. He came of a respectable family, simple but quite nice people. He had been abroad and one day got into a drunken quarrel, drew a knife and stuck it into somebody, and got a year in prison. That is a great secret which he does not mention because it would cast a shadow on his life. Nobody in his town or surroundings knows anything about it and I am the only one who by chance stumbled upon it. In my seminar in Zurich I also make these experiments. Those who want to confess are of course welcome to. However, I always ask them to bring some material of a person *they* know and *I* do not know, and I show them how to read the story of that individual. It is quite interesting work; sometimes one makes remarkable discoveries.

[106] I will give you other instances. Many years ago, when I was quite a young doctor, an old professor of criminology asked me about the

experiment and said he did not believe in it. I said: “No, Professor? You can try it whenever you like.” He invited me to his house and I began. After ten words he got tired and said: “What can you make of it? Nothing has come of it.” I told him he could not expect a result with ten or twelve words; he ought to have a hundred and then we could see something. He said: “Can you do something with these words?” I said: “Little enough, but I can tell you something. Quite recently you have had worries about money, you have too little of it. You are afraid of dying of heart disease. You must have studied in France, where you had a love affair, and it has come back to your mind, as often, when one has thoughts of dying, old sweet memories come back from the womb of time.” He said: “How do you know?” Any child could have seen it! He was a man of 72 and he had associated *heart* with *pain*—fear that he would die of heart failure. He associated *death* with *to die*—a natural reaction—and with *money* he associated *too little*, a very usual reaction. Then things became rather startling to me. To *pay*, after a long reaction time, he said *La Semeuse*, though our conversation was in German. That is the famous figure on the French coin. Now why on earth should this old man say *La Semeuse?* When he came to the word *kiss* there was a long reaction time and there was a light in his eyes and he said: *Beautiful*. Then of course I had the story. He would never have used French if it had not been associated with a particular feeling, and so we must think why he used it. Had he had losses with the French franc? There was no talk of inflation and devaluation in those days. That could not be the clue. I was in doubt whether it was money or love, but when he came to *kiss/beautiful* I knew it was love. He was not the kind of man to go to France in later life, but he had been a student in Paris, a lawyer, probably at the Sorbonne. It was relatively simple to stitch together the whole story.

[107] But occasionally you come upon a real tragedy. Figure 6 is the case of a woman of about thirty years of age. She was in the clinic, and the diagnosis was schizophrenia of a depressive character. The prognosis was correspondingly bad. I had this woman in my ward, and I had a peculiar feeling about her. I felt I could not quite agree with the bad prognosis, because already schizophrenia was a relative idea with me. I thought that we are all relatively crazy, but this woman was peculiar, and I could not

accept the diagnosis as the last word. In those days one knew precious little. Of course I made an anamnesis, but nothing was discovered that threw any light on her illness. Therefore I put her to the association test and finally made a very peculiar discovery. The first disturbance was caused by the word *angel*, and a complete lack of reaction by the word *obstinate*. Then there were *evil, rich, money, stupid, dear*, and *to marry*. Now this woman was the wife of a well-to-do man in a very fine position and apparently happy. I had questioned her husband, and the only thing he could tell me, as she also did, was that the depression came on about two months after her eldest child had died—a little girl four years old. Nothing else could be found out about the aetiology of the case. The association test confronted me with a most baffling series of reactions which I could not put together. You will often be in such a situation, particularly if you have no routine with that kind of diagnosis. Then you first ask the test person about the words which are not going directly to the kernel. If you asked directly about the strongest disturbances you would get wrong answers, so you begin with relatively harmless words and you are likely to get an honest reply. I said: "What about *angel*: Does that word mean something to you?" She replied: "Of course, that is my child whom I have lost." And then came a great flood of tears. When the storm had blown over I asked: "What does *obstinate* mean to you?" She said: "It means nothing to me." But I said: "There was a big disturbance with the word and it means there is something connected with it." I could not penetrate it. I came to the word *evil* and could get nothing out of her. There was a severely negative reaction which showed that she refused to answer. I went on to *blue*, and she said: "Those are the eyes of the child I have lost." I said: "Did they make a particular impression on you?" She said: "Of course. They were so wonderfully blue when the child was born." I noticed the expression on her face, and I said: "Why are you upset?" and she replied: "Well, she did not have the eyes of my husband." Finally it came out that the child had had the eyes of a former lover of hers. I said: "What is upsetting you with regard to that man?" And I was able to worm the story out of her.

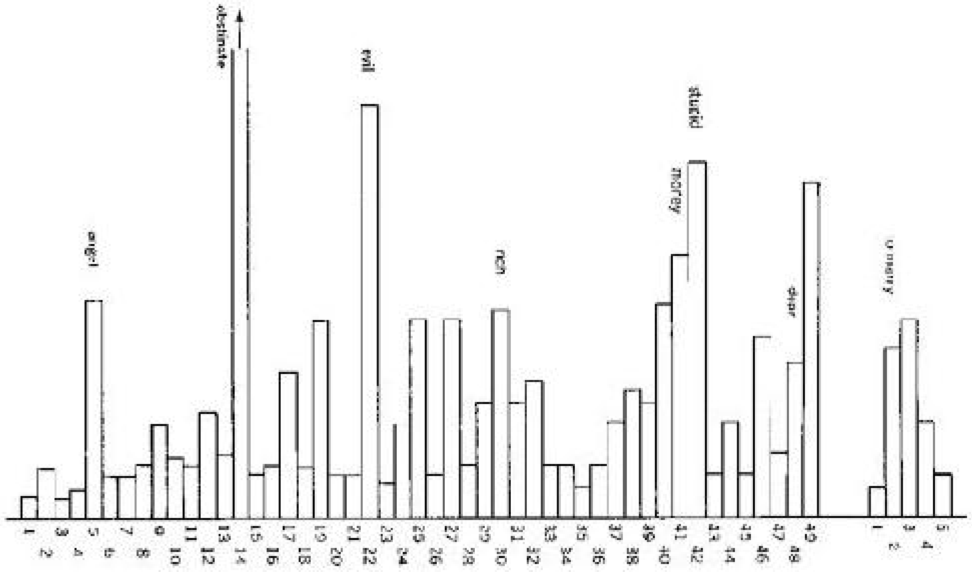

FIG. 6. Association Test

[108] In the little town in which she grew up there was a rich young man. She was of a well-to-do family but nothing grand. The man was of the moneyed aristocracy and the hero of the little town, and every girl dreamed of him. She was a pretty girl and thought she might have a chance. Then she discovered she had no chance with him, and her family said: “Why think of him? He is a rich man and does not think of you. Here is Mr. So-and-So, a nice man. Why not marry him?” She married him and was perfectly happy ever after until the fifth year of her marriage, when a former friend from her native town came to visit her. When her husband left the room he said to her: “You have caused pain to a certain gentleman” (meaning the hero). She said: “What? I caused pain?” The friend replied: “Didn’t you know he was in love with you and was disappointed when you married another man?” That set fire to the roof. But she repressed it. A fortnight later she was bathing her boy, two years, and her girl, four years old. The water in the town—it was not in Switzerland—was not above suspicion, in fact it was infected with typhoid fever. She noticed that the little girl was sucking a sponge. But she did not interfere, and when the little boy said, “I want to drink some water,” she gave him the possibly infected water. The little girl got typhoid fever and died, the little boy was saved. Then she had what she wanted—or what the devil in her wanted—the denial of her marriage in

order to marry the other man. To this end she had committed murder. She did not know it; she only told me the facts and did not draw the conclusion that she was responsible for the death of the child since she knew the water was infected and there was danger. I was faced with the question whether I should tell her she had committed murder, or whether I should keep quiet. (It was only a question of telling *her*, there was no threat of a criminal case.) I thought that if I told her it might make her condition much worse, but there was a bad prognosis anyhow, whereas, if she could realize what she had done, the chance was that she might get well. So I made up my mind to tell her point-blank: “You killed your child.” She went up in the air in an emotional state, but then she came down to the facts. In three weeks we were able to discharge her, and she never came back. I traced her for fifteen years, and there was no relapse. That depression fitted her case psychologically: she was a murderess and under other circumstances would have deserved capital punishment. Instead of going to jail she was sent to the lunatic asylum. I practically saved her from the punishment of insanity by putting an enormous burden on her conscience. For if one can accept one’s sin one can live with it. If one cannot accept it, one has to suffer the inevitable consequences.

Discussion

Question:

[109] I want to refer to last night. Towards the end of his lecture Dr. Jung spoke of higher and lower functions and said the thinking type would use his feeling function archaically. I would like to know: is the reverse true? Does the feeling type, when he tries to think, think archaically? In other words, are thinking and intuition to be regarded always as higher functions than feeling and sensation? I ask this because … I gathered from lectures elsewhere that sensation was the lowest of conscious functions and thinking a higher one. It is certainly the case that in everyday life thinking seems to be the top-notch. The professor—not this Professor—thinking in his study regards himself and is regarded as the highest type, higher than the countryman who says: “Sometimes I sits and thinks and sometimes I just sits.”

Professor Jung:

[110] I hope I did not give you the impression that I was giving a preference to any of the functions. The dominating function in a given individual is always the most differentiated, and that can be *any* function. We have absolutely no criterion by which we can say this or that function in itself is the best. We can only say that the differentiated function in the individual is the best for adapting, and that the one that is most excluded by the superior function is inferior on account of being neglected. There are some modern people who say that intuition is the highest function. Fastidious individuals prefer intuition, it is classy! The sensation type always thinks that other people are very inferior because they are not so real as he is. He is the real fellow and everybody else is fantastic and unreal. Everybody thinks his superior function is the top of the world. In that respect we are liable to the most awful blunders. To realize the actual order of functions in our consciousness, severe psychological criticism is needed. There are many people who believe that world problems are

settled by thinking. But no truth can be established without all four functions. When you have thought the world you have done one-fourth of it; the remaining three-fourths may be against you.

Dr. Eric B. Strauss:

[111] Professor Jung said the word-association test was a means by which one could study the contents of the personal unconscious. In the examples he gave surely the matters revealed were matters in the patient’s conscious mind and not in his unconscious. Surely if one wanted to seek for unconscious material one would have to go a step further and get the patient to associate freely on the anomalous reactions. I am thinking of the association with the word “knife,” when Professor Jung so cleverly assumed the story of the unfortunate incident. That surely was in the patient’s conscious mind, whereas, if the word “knife” had unconscious associations we might, if we were Freudian-minded, have assumed it was associated with an unconscious castration complex or something of that kind. I am not saying it is so, but I do not understand what Professor Jung means when he says the association test is to reach to the patient’s unconscious. Surely in the instance given tonight it is used to reach the conscious, or what Freud would perhaps call the preconscious.

Professor Jung:

[112] I should like very much if you would pay more attention to what I say. I told you that unconscious things are very *relative*. When I am unconscious of a certain thing I am only relatively unconscious of it; in some other respects I may know it. The contents of the personal unconscious are perfectly conscious in certain respects, but you do not know them under a *particular aspect* or at a *particular time.*

[113] How can you establish whether the thing is conscious or unconscious? You simply ask people. We have no other criterion to establish whether something is conscious or unconscious. You ask: “Do you know whether you have had certain hesitations?” They say: “No, I had no hesitation; to my knowledge I had the same reaction time.” “Are

you conscious that something disturbed you?” “No, I am not.” “Have you no recollection of what you answered to the word ‘knife’?” “None at all.” This unawareness of facts is a very common thing. When I am asked if I know a certain man I may say no, because I have no recollection of him and so I am not conscious of knowing him; but when I am told that I met him two years ago, that he is Mr. So-and-So who has done such and such a thing, I reply: “Certainly I know him.” I know him and I do not know him. All the contents of the personal unconscious are *relatively* unconscious, even the castration complex and the incest complex. They are perfectly known under certain aspects, though they are unconscious under others. This relativity of being conscious of something becomes quite plain in hysterical cases. Quite often you find that things which seem unconscious are unconscious only to the doctor but not perhaps to the nurse or the relatives.

[114] I had to see an interesting case once in a famous clinic in Berlin, a case of multiple sarcomatosis of the spinal cord, and because it was a very famous neurologist who had made the diagnosis I almost trembled, but I asked for the anamnesis and had a very nice one worked out. I asked when the symptoms began, and found it was the evening of the day when the only son of the woman had left her and married. She was a widow, quite obviously in love with her son, and I said: “This is no sarcomatosis but an ordinary hysteria, which we can prove presently.” The professor was horrified at my lack of intelligence or tact or I don’t know what, and I had to walk out. But somebody ran after me in the street. It was the nurse, who said: “Doctor, I want to thank you for saying that it *was* hysteria. I always thought so.”

Dr. Eric Graham Howe:

[115] May I return to what Dr. Strauss said? Last night Professor Jung reproved me for merely using words, but I think it is important to get these words clearly understood. I wonder if you have ever asked for the association experiment to be applied to the words “mystic” or “fourth dimension”? I believe you would get a period of great delay and concentrated fury every time they were mentioned. I propose to return to the fourth-dimensional, because I believe it is a link badly needed to help

our understanding. Dr. Strauss uses the word “unconscious,” but I understand from Professor Jung that there is no such thing, there is only a relative unconsciousness which depends on a relative degree of consciousness. According to Freudians, there is a place, a thing, an entity called the unconscious. According to Professor Jung, as I understand him, there is no such thing. He is moving in a fluid medium of relationship and Freud in a static medium of unrelated entities. To get it clear Freud is *three-dimensional* and Jung is, in all his psychology, *four-dimensional*. For this reason, I would criticize if I may the whole diagrammatic system of Jung because he is giving you a three-dimensional presentation of a four-dimensional system, a static presentation of something that is functionally moving, and unless it is explained you get it confused with the Freudian terminology and you cannot understand it. I shall insist that there must be some clarification of words.

Professor Jung:

[116] I could wish Dr. Graham Howe were not so indiscreet. You are right, but you should not say such things. As I explained, I tried to begin with the mildest propositions. You put your foot right into it and speak of four dimensions and of the word “mystic,” and you tell me that all of us would have a long reaction time to such stimulus words. You are quite right, everybody would be stung because we are just beginners in our field. I agree with you that it is very difficult to let psychology be a living thing and not to dissolve it into static entities. Naturally you must express yourself in terms of the fourth dimension when you bring the time factor into a three-dimensional system. When you speak of dynamics and processes you need the time factor, and then you have all the prejudice of the world against you because you have used the word “four-dimensional.” It is a taboo word that should not be mentioned. It has a history, and we should be exceedingly tactful with such words. The more you advance in the understanding of the psyche the more careful you will have to be with terminology, because it is historically coined and prejudiced. The more you penetrate the basic problems of psychology the more you approach ideas which are philosophically, religiously, and

morally prejudiced. Therefore certain things should be handled with the utmost care.

Dr. Howe:

[117] This audience would like you to be provocative. I am going to say a rash thing. You and I do not regard the shape of the ego as a straight line. We would be prepared to regard the sphere as a true shape of the self in four dimensions, of which one is the three-dimensional outline. If so, will you answer a question: “What is the scope of that self which in four dimensions is a moving sphere?” I suggest the answer is: “The universe itself, which includes your concept of the collective racial unconscious.”

Professor Jung:

[118] I should be much obliged if you would repeat that question.

Dr. Howe:

[119] How big is this sphere, which is the four-dimensional self? I could not help giving the answer and saying that it is the same bigness as the universe.

Professor Jung:

[120] This is really a philosophical question, and to answer it requires a great deal of theory of cognition. The world is our picture. Only childish people imagine that the world is what we think it is. The image of the world is a projection of the world of the self, as the latter is an introjection of the world. But only the special mind of a philosopher will step beyond the ordinary picture of the world in which there are static and isolated things. If you stepped beyond that picture you would cause an earthquake in the ordinary mind, the whole cosmos would be shaken, the most sacred convictions and hopes would be upset, and I do not see why one should wish to disquiet things. It is not good for patients, nor for doctors: it is perhaps good for philosophers.

Dr. Ian Suttie:

[121] I should like to go back to Dr. Strauss's question. I can understand what Dr. Strauss means and I think I can understand what Professor Jung means. As far as I can see, Professor Jung fails to make any link between his statement and Dr. Strauss's. Dr. Strauss wanted to know how the word-association test can show the Freudian unconscious, the material that is actually pushed out of mind. As far as I understand Professor Jung, he means what Freud means by the "Id." It seems to me that we should define our ideas well enough to compare them and not merely use them, each in our own school.

Professor Jung:

[122] I must repeat again that my methods do not discover *theories*, they discover *facts*, and I tell you what facts I discover with these methods. I cannot discover a castration complex or a repressed incest or something like that—I find only psychological *facts*, not theories. I am afraid you mix up too much theory with fact and you are perhaps disappointed that the experiments do not reveal a castration complex and such things, but a castration complex is a *theory*. What you find in the association method are definite facts which we did not know before and which the test person also did not know in this particular light. I do not say he did not know it under another light. You know many things when you are in your business that you do not know at home, and at home you know many things that you do not know in your official position. Things are known in one place and somewhere else they are not known. That is what we call unconscious. I must repeat that we cannot penetrate the unconscious *empirically* and then discover, for instance, the Freudian *theory* of the castration complex. The castration complex is a mythological idea, but it is not found as such. What we actually find are certain facts grouped in a specific way, and we name them according to mythological or historical parallels. You cannot find a mythological motif, you can only find a personal motif, and that never appears in the form of a theory but as a living fact of human life. You can abstract a theory from it, Freudian or Adlerian or any other. You can think what you please about the facts of

the world, and there will be as many theories in the end as heads that think about it.

Dr. Suttie:

[123] I protest! I am not interested in this or that theory or what facts are found or not, but I am interested in having a means of communication by which each can know what the others are thinking and for that end I hold that our conceptions must be defined. We must know what the other person means by a certain thing like the unconscious of Freud. As for the word "unconscious," it is becoming more or less known to everybody. It has therefore a certain social or illustrative value, but Jung refuses to recognize the word "unconscious" in the meaning Freud gives to it and uses "unconscious" in a way that we have come to consider as what Freud calls the "Id."

Professor Jung:

[124] The word "unconscious" is not Freud's invention. It was known in German philosophy long before, by Kant and Leibniz and others, and each of them gives his definition of that term. I am perfectly well aware that there are many different conceptions of the unconscious, and what I was trying humbly to do was to say what *I* think about it. It is not that I undervalue the merits of Leibniz, Kant, von Hartmann, or any other great man, including Freud and Adler and so on. I was only explaining what *I* mean by the unconscious, and I presuppose that you are all aware of what Freud means by it. I did not think it was my task to explain things in such a way that somebody who is convinced of Freud's theory and prefers that point of view would be upset in his belief. I have no tendency to destroy your convictions or points of view. I simply exhibit my own point of view, and if anybody should be tempted to think that this also is reasonable, that is all I want. It is perfectly indifferent to me what one thinks about the unconscious in general, otherwise I should begin a long dissertation on the concept of the unconscious as understood by Leibniz, Kant, and von Hartmann.

Dr. Suttie:

[125] Dr. Strauss asked about the relationship of the unconscious as conceived by you and by Freud. Is it possible to bring them into precise and definite relationship?

Professor Jung:

[126] Dr. Graham Howe has answered the question. Freud is seeing the mental processes as static, while I speak in terms of dynamics and relationship. To me all is relative. There is nothing definitely unconscious; it is only not present to the conscious mind under a certain light. You can have very different ideas of why a thing is known under one aspect and not known under another aspect. The only exception I make is the mythological pattern, which is profoundly unconscious, as I can prove by the facts.

Dr. Strauss:

[127] Surely there is a difference between using your association test as a crime detector and for finding, let us say, unconscious guilt. Your criminal is conscious of his guilt and he is conscious that he is afraid of its being discovered. Your neurotic is unaware of his guilt and unaware that he is afraid of his guilt. Can the same kind of technique be used in these two very different kinds of cases?

The Chairman:

[128] This woman was not conscious of her guilt though she had allowed the child to suck the sponge.

Professor Jung:

[129] I will show you the difference experimentally. In Figure 7 you have a short illustration of respiration during the association test. You see four series of seven respirations registered after the stimulus words. The

diagrams are condensations of respirations after indifferent and critical stimulus words in a greater number of test persons.

[130] "A" gives respirations after indifferent stimulus words. The first inspirations after the stimulus words are restricted, while the following inspirations are of normal size.

[131] In "B" where the stimulus word was a critical one the volume of breathing is definitely restricted, sometimes by more than half the normal size.

[132] In "C" we have the behaviour of breathing after a stimulus word relating to a complex that was conscious to the test persons. The first inspiration is almost normal, and only later you find a certain restriction.

[133] In "D" the respiration is after a stimulus word that was related to a complex of which the test persons were unconscious. In this case the first inspiration is remarkably small and the following are rather below normal.

[134] These diagrams illustrate very clearly the difference of reaction between conscious and unconscious complexes. In "C," for instance, the complex is conscious. The stimulus word hits the test person, and there is a deep inspiration. But when the stimulus word hits an unconscious complex, the volume of breathing is restricted, as shown in "D" *I*. There is a spasm in the thorax, so that almost no breathing takes place. In that way one has empirical proof of the physiological difference between conscious and unconscious reaction.[14]

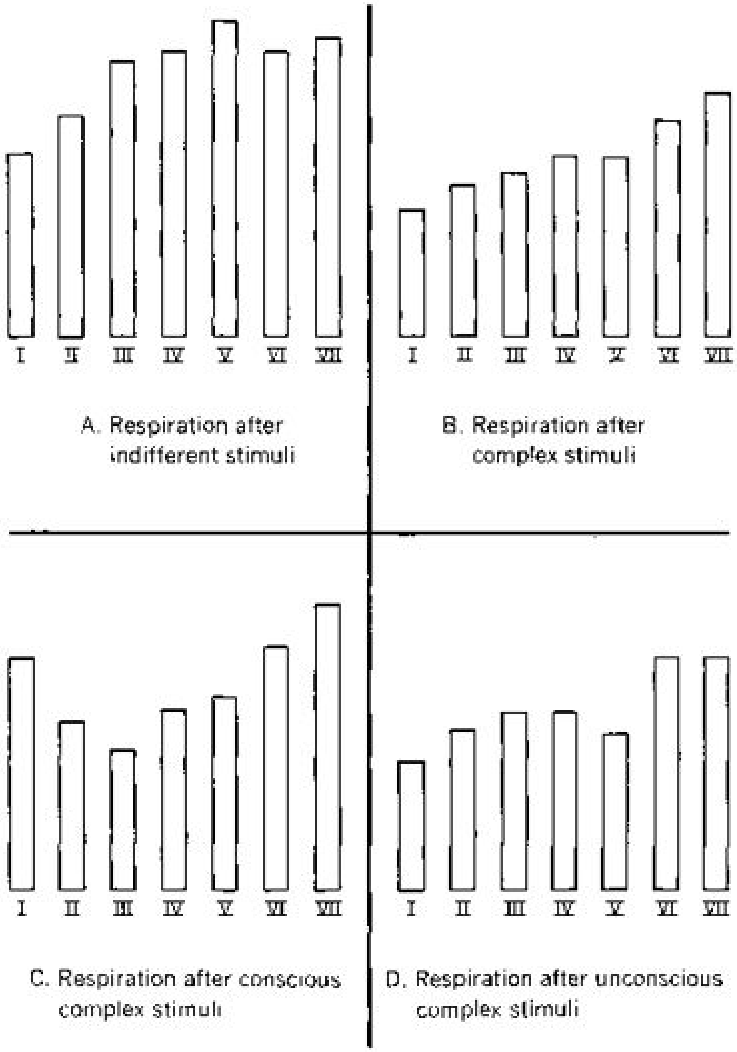

FIG. 7. Association Test Respiration

Dr. Wilfred R. Bion:

[135] You gave an analogy between archaic forms of the body and archaic forms of the mind. Is it purely an analogy or is there in fact a closer relationship? Last night you said something which suggested that you consider there is a connection between the mind and the brain, and there has lately been published in the *British Medical Journal* a diagnosis of yours from a dream of a physical disorder.[15] If that case was correctly reported it makes a very important suggestion, and I wondered whether

you considered there was some closer connection between the two forms of archaic survival.

Professor Jung:

[136] You touch again on the controversial problem of psychophysical parallelism for which I know of no answer, because it is beyond the reach of man’s cognition. As I tried to explain yesterday, the two things—the psychic fact and the physiological fact—come together in a peculiar way. They happen together and are, so I assume, simply two different aspects to our *mind*, but not in reality. We see them as two on account of the utter incapacity of our mind to think them together. Because of that possible unity of the two things, we must expect to find dreams which are more on the physiological side than on the psychological, as we have other dreams that are more on the psychological than on the physical side. The dream to which you refer was very clearly a representation of an organic disorder. These “organic representations” are well known in ancient literature. The doctors of antiquity and of the Middle Ages used dreams for their diagnosis. I did not conduct a physical examination on the man you refer to. I only heard his history and was told the dream, and I gave my opinion on it. I have had other cases, for instance a very doubtful case of progressive muscular atrophy in a young girl. I asked about dreams and she had two dreams which were very colourful. A colleague, a man who knew something of psychology, thought it might be a case of hysteria. There were indeed hysterical symptoms, and it was still doubtful if it was progressive muscular atrophy or not; but on account of the dreams I came to the conclusion that it must be an organic disease, and the end proved my diagnosis. It was an organic disturbance, and the dreams were definitely referring to the organic condition.[16] According to my idea of the community of the psyche and the living body it should be like that, and it would be marvellous if it were not so.

Dr. Bion:

[137] Will you be talking of that later when you speak on dreams?

Professor Jung:

[138] I am afraid that I cannot go into such detail; it is too special. It is really a matter of special experience, and its presentation would be a very difficult job. It would not be possible to describe to you briefly the criteria by which I judge such dreams. The dream you mentioned, you may remember, was a dream of the little mastodon. To explain what that mastodon really means in an organic respect and why I must take that dream as an organic symptom would start such an argument that you would accuse me of the most terrible obscurantism. These things really are obscure. I had to speak in terms of the basic mind, which thinks in archetypal patterns. When I speak of archetypal patterns those who are aware of these things understand, but if you are not aware you think, "This fellow is absolutely crazy because he talks of mastodons and their difference from snakes and horses." I should have to give you a course of about four semesters about symbology first so that you could appreciate what I said.

[139] That is the great trouble: there is such a gap between what is usually known of these things and what I have worked on all these years. If I were to speak of this even before a medical audience I should have to talk of the peculiarities of the *niveau mental*, to quote Janet, and I might as well talk Chinese. For instance, I would say that the *abaissement du niveau mental* sank in a certain case to the level of the *manipura chakra*,[17] that is, to the level of the navel. We Europeans are not the only people on the earth. We are just a peninsula of Asia, and on that continent there are old civilizations where people have trained their minds in introspective psychology for thousands of years, whereas we began with our psychology not even yesterday but only this morning. These people have an insight that is simply fabulous, and I had to study Eastern things to understand certain facts of the unconscious. I had to go back to understand Oriental symbolism. I am about to publish a little book on one symbolic motif only,[18] and you will find it hair-raising. I had to study not only Chinese and Hindu but Sanskrit literature and medieval Latin manuscripts which are not even known to specialists, so that one must go to the British Museum to find the references. Only when you possess that

apparatus of parallelism can you begin to make diagnoses and say that this dream is organic and that one is not. Until people have acquired that knowledge I am just a sorcerer. They say it is *un tour de passe-passe*. They said it in the Middle Ages. They said, “How can you see that Jupiter has satellites?” If you reply that you have a telescope, what is a telescope to a medieval audience?

[140] I do not mean to boast about this. I am always perplexed when my colleagues ask: “How do you establish such a diagnosis or come to this conclusion?” I reply: “I will explain if you will allow me to explain what you ought to know to be able to understand it.” I experienced this myself when the famous Einstein was Professor at Zurich. I often saw him, and it was when he was beginning to work on his theory of relativity. He was often in my house, and I pumped him about his relativity theory. I am not gifted in mathematics and you should have seen all the trouble the poor man had to explain relativity to me. He did not know how to do it. I went fourteen feet deep into the floor and felt quite small when I saw how he was troubled. But one day he asked me something about psychology. Then I had my revenge.

[141] Special knowledge is a terrible disadvantage. It leads you in a way too far, so that you cannot explain any more. You must allow me to talk to you about seemingly elementary things, but if you will accept them I think you will understand why I draw such and such conclusions. I am sorry that we do not have more time and that I cannot tell you everything. When I come to dreams I have to give myself away and to risk your thinking me a perfect fool, because I am not able to put before you all the historical evidence which led to my conclusions. I should have to quote bit after bit from Chinese and Hindu literature, medieval texts and all the things which you do not know. How could you? I am working with specialists in other fields of knowledge and they help me. There was my late friend Professor Wilhelm, the sinologist; I worked with him. He had translated a Taoist text, and he asked me to comment on it, which I did from the psychological side.[19] I am a terrible novelty to a sinologist, but what he has to tell us is a novelty to us. The Chinese philosophers were no fools. We think the old people were fools, but they were as intelligent as we are. They were frightfully intelligent people, and psychology can

learn no end from old civilizations, particularly from India and China. A former President of the British Anthropological Society asked me: “Can you understand that such a highly intelligent people as the Chinese have no science?” I replied: “They have a science, but you do not understand it. It is not based on the principle of causality. The principle of causality is not the only principle; it is only relative.”

[142] People may say: What a fool to say causality is only relative! But look at modern physics! The East bases its thinking and its evaluation of facts on another principle. We have not even a word for that principle. The East naturally has a word for it, but we do not understand it. The Eastern word is *Tao*. My friend McDougall[20] has a Chinese student, and he asked him: “What exactly do you mean by Tao?” Typically Western! The Chinese explained what Tao is and he replied: “I do not understand yet.” The Chinese went out to the balcony and said: “What do you see?” “I see a street and houses and people walking and tramcars passing.” “What more?” “There is a hill.” “What more?” “Trees.” “What more?” “The wind is blowing.” The Chinese threw up his arms and said: “That is Tao.”

[143] There you are. Tao can be anything. I use another word to designate it, but it is poor enough. I call it *synchronicity*. The Eastern mind, when it looks at an ensemble of facts, accepts that ensemble as it is, but the Western mind divides it into entities, small quantities. You look, for instance, at this present gathering of people, and you say: “Where do they come from? Why should they come together?” The Eastern mind is not at all interested in that. It says: “What does it *mean* that these people are together?” That is not a problem for the Western mind. You are interested in what you come here for and what you are doing here. Not so the Eastern mind; it is interested in being together.

[144] It is like this: you are standing on the sea-shore and the waves wash up an old hat, an old box, a shoe, a dead fish, and there they lie on the shore. You say: “Chance, nonsense!” The Chinese mind asks: “What does it mean that these things are together?” The Chinese mind experiments with that *being together* and *coming together at the right moment*, and it has an experimental method which is not known in the West, but which plays a large role in the philosophy of the East. It is a

method of forecasting possibilities, and it is still used by the Japanese Government about political situations; it was used, for instance, in the Great War. This method was formulated in 1143 B.C.[21]

LECTURE III

The Chairman (Dr. Maurice B. Wright):

[145] Ladies and Gentlemen, it is my privilege to be the Chairman at Professor Jung's lecture at this evening's meeting. It was my privilege twenty-one years ago to meet Professor Jung when he came over to London to give a series of addresses,[1] but there was then a very small group of psychologically minded physicians. I remember very well how after the meetings we used to go to a little restaurant in Soho and talk until we were turned out. Naturally we were trying to pump Professor Jung as hard as we could. "When I said goodbye to Professor Jung he said to me—he did not say it very seriously—"I think you are an extravert who has become an introvert." Frankly, I have been brooding about that ever since!

[146] Now, ladies and gentlemen, just a word about last night. I think Professor Jung gave us a very good illustration of his views and of his work when he talked about the value of the telescope. A man with a telescope naturally can see a good deal more than anybody with unaided sight. That is exactly Professor Jung's position. With his particular spectacles, with his very specialized research, he has acquired a knowledge, a vision of the depth of the human psyche, which for many of us is very difficult to grasp. Of course, it will be impossible for him in the space of a few lectures to give us more than a very short outline of the vision he has gained. Therefore, in my opinion anything which might seem blurred or dark is not a question of obscurantism, it is a question of spectacles. My own difficulty is that, with my muscles of accommodation already hardening, it might be impossible for me ever to see that vision clearly, even if for the moment Professor Jung could lend me his spectacles. But however this may be, I know that we are all thrilled with everything he can tell us, and we know how stimulating it is to our own thinking, especially in a domain where speculation is so easy and where proof is so difficult.

Professor Jung:

[147] Ladies and Gentlemen, I ought to have finished my lecture on the association tests yesterday, but I would have had to overstep my time. So you must pardon me for coming back to the same thing once more. It is not that I am particularly in love with the association tests. I use them only when I must, but they are really the foundation of certain conceptions. I told you last time about the characteristic disturbances, and I think it would be a good thing, perhaps, if I were briefly to sum up all there is to say about the results of the experiment, namely about the complexes.

[148] A complex is an agglomeration of associations—a sort of picture of a more or less complicated psychological nature—sometimes of traumatic character, sometimes simply of a painful and highly toned character. Everything that is highly toned is rather difficult to handle. If, for instance, something is very important to me, I begin to hesitate when I attempt to do it, and you have probably observed that when you ask me difficult questions I cannot answer them immediately because the subject is important and I have a long reaction time. I begin to stammer, and my memory does not supply the necessary material. Such disturbances are complex disturbances—even if what I say does not come from a personal complex of mine. It is simply an important affair, and whatever has an intense feeling-tone is difficult to handle because such contents are somehow associated with physiological reactions, with the processes of the heart, the tonus of the blood vessels, the condition of the intestines, the breathing, and the innervation of the skin. Whenever there is a high tonus it is just as if that particular complex had a body of its own, as if it were localized in my body to a certain extent, and that makes it unwieldy, because something that irritates my body cannot be easily pushed away because it has its roots in my body and begins to pull at my nerves. Something that has little tonus and little emotional value can be easily brushed aside because it has no roots. It is not adherent or adhesive.

[149] Ladies and Gentlemen, that leads me to something very important—the fact that a complex with its given tension or energy has the tendency to form a little personality of itself. It has a sort of body, a certain amount

of its own physiology. It can upset the stomach. It upsets the breathing, it disturbs the heart—in short, it behaves like a partial personality. For instance, when you want to say or do something and unfortunately a complex interferes with this intention, then you say or do something different from what you intended. You are simply interrupted, and your best intention gets upset by the complex, exactly as if you had been interfered with by a human being or by circumstances from outside. Under those conditions we really are forced to speak of the tendencies of complexes to act as if they were characterized by a certain amount of will-power. When you speak of will-power you naturally ask about the ego. Where then is the ego that belongs to the will-power of the complexes? We know our own ego-complex, which is supposed to be in full possession of the body. It is not, but let us assume that it is a centre in full possession of the body, that there is a focus which we call the ego, and that the ego has a will and can do something with its components. The ego also is an agglomeration of highly toned contents, so that in principle there is no difference between the ego-complex and any other complex.

[150] Because complexes have a certain will-power, a sort of ego, we find that in a schizophrenic condition they emancipate themselves from conscious control to such an extent that they become visible and audible. They appear as visions, they speak in voices which are like the voices of definite people. This personification of complexes is not in itself necessarily a pathological condition. In dreams, for instance, our complexes often appear in a personified form. And one can train oneself to such an extent that they become visible or audible also in a waking condition. It is part of a certain yoga training to split up consciousness into its components, each of which appears as a specific personality. In the psychology of our unconscious there are typical figures that have a definite life of their own.[2]

[151] All this is explained by the fact that the so-called unity of consciousness is an illusion. It is really a wish-dream. We like to think that we are one; but we are not, most decidedly not. We are not really masters in our house. We like to believe in our will-power and in our energy and in what we can do; but when it comes to a real show-down

we find that we can do it only to a certain extent, because we are hampered by those little devils the complexes. Complexes are autonomous groups of associations that have a tendency to move by themselves, to live their own life apart from our intentions. I hold that our personal unconscious, as well as the collective unconscious, consists of an indefinite, because unknown, number of complexes or fragmentary personalities.

[152] This idea explains a lot. It explains, for instance, the simple fact that a poet has the capacity to dramatize and personify his mental contents. When he creates a character on the stage, or in his poem or drama or novel, he thinks it is merely a product of his imagination; but that character in a certain secret way has made itself. Any novelist or writer will deny that these characters have a psychological meaning, but as a matter of fact you know as well as I do that they have one. Therefore you can read a writer's mind when you study the characters he creates.

[153] The complexes, then, are partial or fragmentary personalities. When we speak of the ego-complex, we naturally assume that it has a consciousness, because the relationship of the various contents to the centre, in other words to the ego, is called consciousness. But we also have a grouping of contents about a centre, a sort of nucleus, in other complexes. So we may ask the question: Do complexes have a consciousness of their own? If you study spiritualism, you must admit that the so-called spirits manifested in automatic writing or through the voice of a medium do indeed have a sort of consciousness of their own. Therefore unprejudiced people are inclined to believe that the spirits are the ghosts of a deceased aunt or grandfather or something of the kind, just on account of the more or less distinct personality which can be traced in these manifestations. Of course, when we are dealing with a case of insanity we are less inclined to assume that we have to do with ghosts. We call it pathological then.

[154] So much about the complexes. I insist on that particular point of consciousness within complexes only because complexes play a large role in dream-analysis. You remember my diagram (Figure 4) showing the different spheres of the mind and the dark centre of the unconscious in the middle. The closer you approach that centre, the more you

experience what Janet calls an *abaissement du niveau mental:* your conscious autonomy begins to disappear, and you get more and more under the fascination of unconscious contents. Conscious autonomy loses its tension and its energy, and that energy reappears in the increased activity of unconscious contents. You can observe this process in an extreme form when you carefully study a case of insanity. The fascination of unconscious contents gradually grows stronger and conscious control vanishes in proportion until finally the patient sinks into the unconscious altogether and becomes completely victimized by it. He is the victim of a new autonomous activity that does not start from his ego but starts from the dark sphere.

[155] In order to deal with the association test thoroughly, I must mention an entirely different experiment. You will forgive me if for the sake of economizing time I do not go into the details of the researches, but these diagrams (Figs. 8, 9, 10, 11) illustrate the results of very voluminous researches into families.[3] They represent the quality of associations. For instance, the little summit in Figure 8 designated as number XI is a special class or category of association. The principle of classification is logical and linguistic. I am not going into this, and you will simply have to accept the fact that I have made fifteen categories into which I divide associations. We made tests with a great number of families, all for certain reasons uneducated people, and we found that the type of association and reaction is peculiarly parallel among certain members of the family; for instance, father and mother, or two brothers, or mother and child are almost identical in their type of reaction.

[156] I shall explain this by Figure 8. The dotted line (.....) represents the mother, the broken line (-----) her sixteen-year-old daughter, and the unbroken line (-) the father. This was a very unfortunate marriage. The father was an alcoholic and the mother was a very peculiar type. You see that the sixteen-year-old daughter follows her mother’s type closely. As much as thirty per cent of all associations are identical words. This is a striking case of participation, of mental contagion. If you think about this case you can draw certain conclusions. The mother was forty-five years old, married to an alcoholic. Her life was therefore a failure. Now the daughter has exactly the same reactions as the mother. If such a girl

comes out into the world as though she were forty-five years old and married to an alcoholic, think what a mess she will get into! This participation explains why the daughter of an alcoholic who has had a hell of a youth will seek a man who is an alcoholic and marry him; and if by chance he should not be one, she will make him into one on account of that peculiar identity with one member of the family.

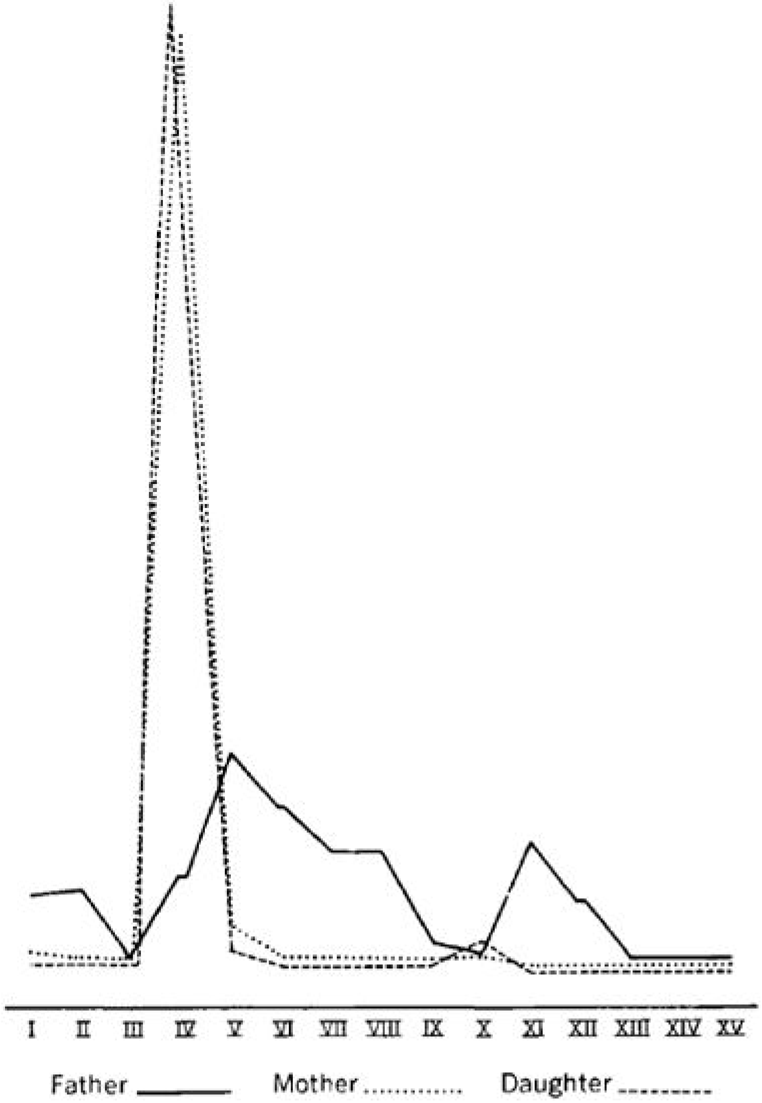

FIG. 8. Association Test of a Family

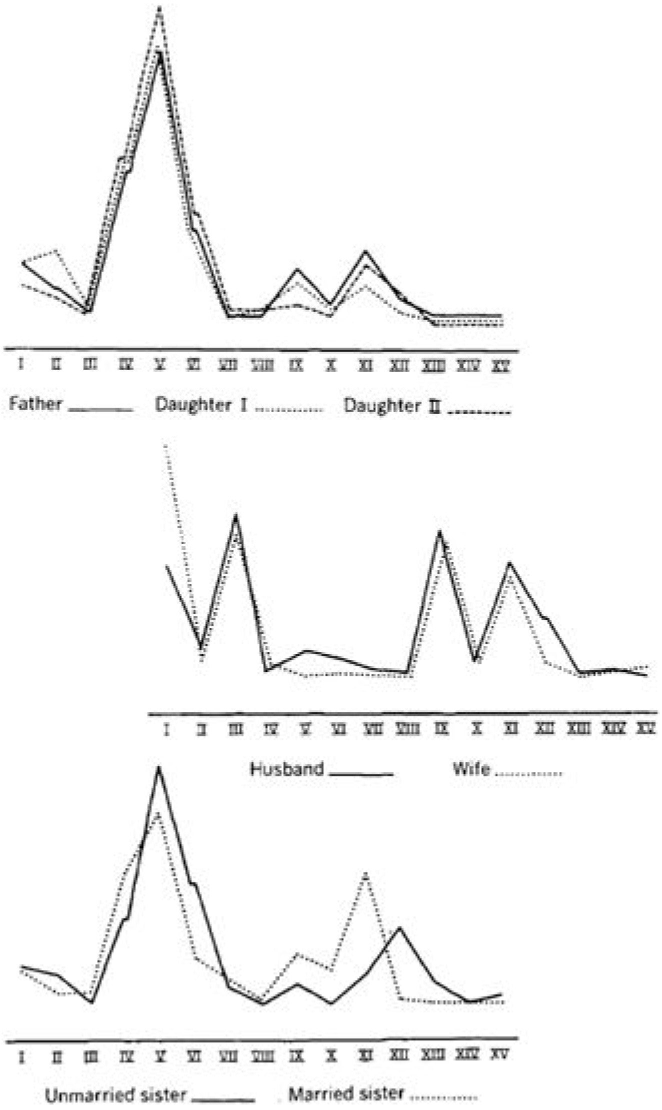

FIGS. 9–11. Association Tests of Families

[157] Figure 9 is a very striking case, too. The father, who was a widower, had two daughters who lived with him in complete identity. Of course, that also is most unnatural, because either he reacts like a girl or the two girls react like a man, even in the way they speak. The whole mental make-up is poisoned through the admixture of an alien element, because a young daughter is not in actual fact her father.

[158] Figure 10 is the case of a husband and wife. This diagram gives an optimistic tone to my very pessimistic demonstrations. You see there is perfect harmony here; but do not make the mistake of thinking that this harmony is a paradise, for these people will kick against each other after

a while because they are just too harmonious. A very good harmony in a family based on participation soon leads to frantic attempts on the part of the spouses to kick loose from each other, to liberate themselves, and then they invent irritating topics of discussion in order to have a reason for feeling misunderstood. If you study the ordinary psychology of marriage, you discover that most of the troubles consist in this cunning invention of irritating topics which have absolutely no foundation.

[159] Figure 11 is also interesting. These two women are sisters living together; one is single and the other married. Their summit is found at number V. The wife in Figure 10 is the sister of these two women in Figure 11, and while most probably they were all of the same type originally, she married a man of another type. Their summit is at number III in Figure 10. The condition of identity or participation which is demonstrated in the association test can be substantiated by entirely different experiences, for instance, by graphology. The handwriting of many wives, particularly young wives, often resembles that of the husband. I do not know whether it is so in these days, but I assume that human nature remains very much the same. Occasionally it is the other way round because the so-called feeble sex has its strength sometimes.

[160] Ladies and Gentlemen, we are now going to step over the border into dreams. I do not want to give you any particular introduction to dream-analysis.[4] I think the best way is just to show you how I proceed with a dream, and then it does not need much explanation of a theoretical kind, because you can see what are my underlying ideas. Of course, I make great use of dreams, because dreams are an objective source of information in psychotherapeutic treatment. When a doctor has a case, he can hardly refrain from having ideas about it. But the more one knows about cases, the more one should make an heroic effort not to know in order to give the patient a fair chance. I always try not to know and not to see. It is much better to say you are stupid, or play what is apparently a stupid role, in order to give the patient a chance to come out with his own material. That does not mean that you should hide altogether.

[161] This is a case of a man forty years old, a married man who has not been ill before. He looks quite all right; he is the director of a great public school, a very intelligent fellow who has studied an old-fashioned kind of

psychology, Wundt psychology,[5] that has nothing to do with details of human life but moves in the stratosphere of abstract ideas. Recently he had been badly troubled by neurotic symptoms. He suffered from a peculiar kind of vertigo that seized upon him from time to time, palpitation, nausea, and peculiar attacks of feebleness and a sort of exhaustion. This syndrome presents the picture of a sickness which is well known in Switzerland. It is mountain sickness, a malady to which people who are not used to great heights are easily subject when climbing. So I asked, "Is it not mountain sickness you are suffering from?" He said, "Yes, you are right. It feels exactly like mountain sickness." I asked him if he had dreams, and he said that recently he had had three dreams.

[162] I do not like to analyse one dream alone, because a single dream can be interpreted arbitrarily. You can speculate anything about an isolated dream; but if you compare a series of, say, twenty or a hundred dreams, then you can see interesting things. You see the process that is going on in the unconscious from night to night, and the continuity of the unconscious psyche extending through day and night. Presumably we are dreaming all the time, although we are not aware of it by day because consciousness is much too clear. But at night, when there is that *abaissement du niveau mental*, the dreams can break through and become visible.

[163] In the first dream *the patient finds himself in a small village in Switzerland. He is a very solemn black figure in a long coat; under his arm he carries several thick books. There is a group of young boys whom he recognizes as having been his classmates. They are looking at him and they say: "That fellow does not often make his appearance here."*

[164] In order to understand this dream you have to remember that the patient is in a very fine position and has had a very good scientific education. But he started really from the bottom and is a self-made man. His parents were very poor peasants, and he worked his way up to his present position. He is very ambitious and is filled with the hope that he will rise still higher. He is like a man who has climbed in one day from sea-level to a level of 6,000 feet, and there he sees peaks 12,000 feet high towering above him. He finds himself in the place from which one climbs

these higher mountains, and because of this he forgets all about the fact that he has already climbed 6,000 feet and immediately he starts to attack the higher peaks. But as a matter of fact though he does not realize it he is tired from his climbing and quite incapable of going any further at this time. This lack of realization is the reason for his symptoms of mountain sickness. The dream brings home to him the actual psychological situation. The contrast of himself as the solemn figure in the long black coat with thick books under his arm appearing in his native village, and of the village boys remarking that he does not often appear there, means that he does not often remember where he came from. On the contrary he thinks of his future career and hopes to get a chair as professor. Therefore the dream puts him back into his early surroundings. He ought to realize how much he has achieved considering who he was originally and that there are natural limitations to human effort.

[165] The beginning of the second dream is a typical instance of the kind of dream that occurs when the conscious attitude is like his. *He knows that he ought to go to an important conference, and he is taking his portfolio. But he notices that the hour is rather advanced and that the train will leave soon, and so he gets into that well-known state of haste and of fear of being too late. He tries to get his clothes together, his hat is nowhere, his coat is mislaid, and he runs about in search of them and shouts up and down the house, "Where are my things?" Finally he gets everything together, and runs out of the house only to find that he has forgotten his portfolio. He rushes back for it, and looking at his watch finds how late it is getting; then he runs to the station, but the road is quite soft so that it is like walking on a bog and his feet can hardly move any more. Pantingly he arrives at the station only to see that the train is just leaving. His attention is called to the railway track, and it looks like this:*

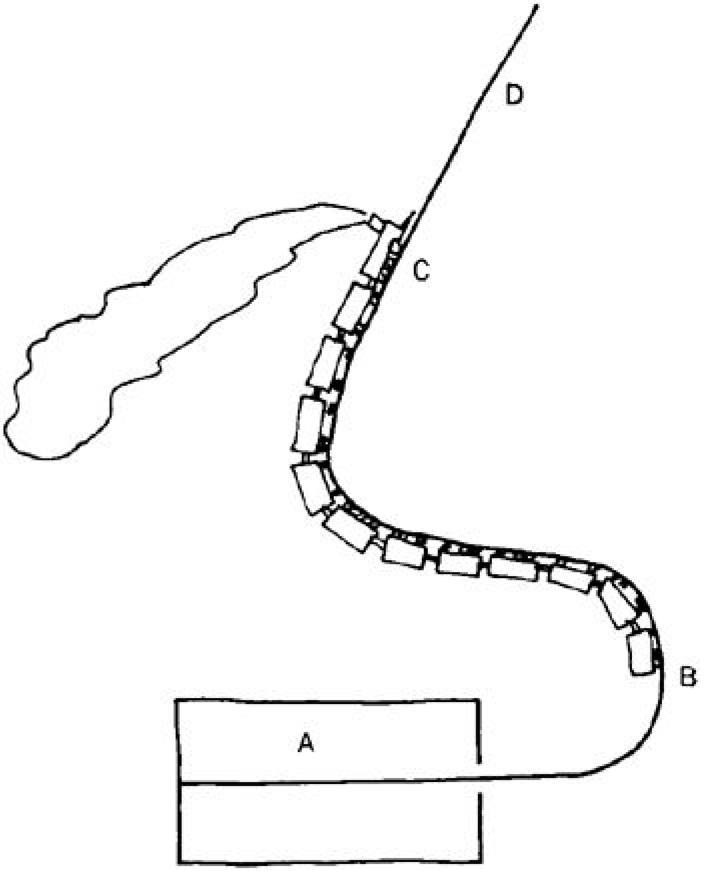

FIG. 12. Dream of the Train

[166] *He is at A, the tail-end of the train is already at B and the engine is at C. He watches the train, a long one, winding round the curve, and he thinks, “If only the engine-driver, when he reaches point D, has sufficient intelligence not to rush full steam ahead; for if he does, the long train behind him which will still be rounding the curve will be derailed.” Now the engine-driver arrives at D and he opens the steam throttle fully, the engine begins to pull, and the train rushes ahead. The dreamer sees the catastrophe coming, the train goes off the rails, and he shouts, and then he wakes up with the fear characteristic of nightmare.*

[167] Whenever one has this kind of dream of being late, of a hundred obstacles interfering, it is exactly the same as when one is in such a situation in reality, when one is nervous about something. One is nervous because there is an unconscious resistance to the conscious intention. The most irritating thing is that consciously you want something very much, and an unseen devil is always working against it, and of course you are

that devil too. You are working against this devil and do it in a nervous way and with nervous haste. In the case of this dreamer, that rushing ahead is also against his will. He does not want to leave home, yet he wants it very much, and all the resistance and difficulties in his way are his own doing. He is that engine-driver who thinks, “Now we are out of our trouble; we have a straight line ahead, and now we can rush along like anything.” The straight line beyond the curve would correspond to the peaks 12,000 feet high, and he thinks these peaks are accessible to him.

[168] Naturally, nobody seeing such a chance ahead would refrain from making the utmost use of it, so his reason says to him, “Why not go on, you have every chance in the world.” He does not see why something in him should work against it. But this dream gives him a warning that he should not be as stupid as this engine-driver who goes full steam ahead when the tail-end of the train is not yet out of the curve. That is what we always forget; we always forget that our consciousness is only a surface, our consciousness is the avant-garde of our psychological existence. Our head is only one end, but behind our consciousness is a long historical “tail” of hesitations and weaknesses and complexes and prejudices and inheritances, and we always make our reckoning without them. We always think we can make a straight line in spite of our shortcomings, but they will weigh very heavily and often we derail before we have reached our goal because we have neglected our tail-ends.

[169] I always say that our psychology has a long saurian’s tail behind it, namely the whole history of our family, of our nation, of Europe, and of the world in general. We are always human, and we should never forget that we carry the whole burden of being only human. If we were heads only we should be like little angels that have heads and wings, and of course they can do what they please because they are not hindered by a body that can walk only on the earth. I must not omit to point out, not necessarily to the patient but to myself, that this peculiar movement of the train is like a snake. Presently we shall see why.

[170] The next dream is the crucial dream, and I shall have to give certain explanations. In this dream we have to do with a peculiar animal which is half lizard and half crab. Before we go into the details of the dream, I

want to make a few remarks about the method of working out the meaning of a dream. You know that there are many views and many misunderstandings as to the way in which you get at dreams.

[171] You know, for instance, what is understood by free association. This method is a very doubtful one as far as my experience goes. Free association means that you open yourself to any amount and kind of associations and they naturally lead to your complexes. But then, you see, I do not want to know the complexes of my patients. That is uninteresting to me. I want to know what the *dreams* have to say about complexes, not what the complexes are. I want to know what a man's unconscious is doing with his complexes, I want to know what he is preparing himself for. *That* is what I read out of the dreams. If I wanted to apply the method of free association I would not need dreams. I could put up a signboard, for instance "Footpath to So-and-So," and simply let people meditate on that and add free associations, and they would invariably arrive at their complexes. If you are riding in a Hungarian or Russian train and look at the strange signs in the strange language, you can associate all your complexes. You have only to let yourself go and you naturally drift into your complexes.

[172] I do not apply the method of free association because my goal is not to know the complexes; I want to know what the dream is. Therefore I handle the dream as if it were a text which I do not understand properly, say a Latin or a Greek or a Sanskrit text, where certain words are unknown to me or the text is fragmentary, and I merely apply the ordinary method any philologist would apply in reading such a text. My idea is that the dream does not conceal: we simply do not understand its language. For instance, if I quote to you a Latin or a Greek passage some of you will not understand it, but that is not because the text dissimulates or conceals; it is because you do not know Greek or Latin. Likewise, when a patient seems confused, it does not necessarily mean that he is confused, but that the doctor does not understand his material. The assumption that the dream wants to conceal is a mere anthropomorphic idea. No philologist would ever think that a difficult Sanskrit or cuneiform inscription conceals. There is a very wise word of the Talmud which says that the dream is its own interpretation. The dream is the

whole thing, and if you think there is something behind it, or that the dream has concealed something, there is no question but that you simply do not understand it.

[173] Therefore, first of all, when you handle a dream you say, “I do not understand a word of that dream.” I always welcome that feeling of incompetence because then I know I shall put some good work into my attempt to understand the dream. What I do is this. I adopt the method of the philologist, which is far from being free association, and apply a logical principle which is called *amplification*. It is simply that of seeking the parallels. For instance, in the case of a very rare word which you have never come across before, you try to find parallel text passages, parallel applications perhaps, where that word also occurs, and then you try to put the formula you have established from the knowledge of other texts into the new text. If you make the new text a readable whole, you say, “Now we can read it.” That is how we learned to read hieroglyphics and cuneiform inscriptions and that is how we can read dreams.

[174] Now, how do I find the context? Here I simply follow the principle of the association experiment. Let us assume a man dreams about a simple sort of peasant’s house. Now, do I know what a simple peasant’s house conveys to that man’s mind? Of course not; how could I? Do I know what a simple peasant’s house means to him in general? Of course not. So I simply ask, “How does that thing appear to you?”—in other words, what is your context, what is the mental tissue in which that term “simple peasant’s house” is embedded? He will tell you something quite astonishing. For instance, somebody says “water.” Do I know what he means by “water”? Not at all. When I put that test word or a similar word to somebody, he will say “green.” Another one will say “H_2O,” which is something quite different. Another one will say “quicksilver,” or “suicide.” In each case I know what tissue that word or image is embedded in. That is *amplification*. It is a well-known logical procedure which we apply here and which formulates exactly the technique of finding the context.

[175] Of course. I ought to mention here the merit of Freud, who brought up the whole question of dreams and who has enabled us to approach the problem of dreams at all. You know his idea is that a dream is a distorted

representation of a secret incompatible wish which does not agree with the conscious attitude and therefore is censored, that is, distorted, in order to become unrecognizable to the conscious and yet in a way to show itself and live. Freud logically says then: Let us redress that whole distortion: now be natural, give up your distorted tendencies and let your associations flow freely, then we will come to your natural facts, namely, your complexes. This is an entirely different point of view from mine. Freud is seeking the complexes, I am not. That is just the difference. I am looking for what the *unconscious is doing* with the complexes, because that interests me very much more than the fact that people have complexes. We all have complexes: it is a highly banal and uninteresting fact. Even the incest complex which you can find anywhere if you look for it is terribly banal and therefore uninteresting. It is only interesting to know what people do with their complexes; that is the practical question which matters. Freud applies the method of free association and makes use of an entirely different logical principle, a principle which in logic is called *reductio in primam figuram*. reduction to the first figure. The *reductio in primam figuram* is a so-called syllogism, a complicated sequence of logical conclusions, whose characteristic is that you start from a perfectly reasonable statement, and, through surreptitious assumptions and insinuations, you gradually change the reasonable nature of your first simple or prime figure until you reach a complete distortion which is utterly unreasonable. That complete distortion, in Freud's idea, characterizes the dream; the dream is a clever distortion that disguises the original figure, and you have only to undo the web in order to return to the first reasonable statement, which may be "I wish to commit this or that: I have such and such an incompatible wish." We start, for instance, with a perfectly reasonable assumption, such as "No unreasonable being is free"—in other words, has free will. This is an example which is used in logic. It is a fairly reasonable statement. Now we come to the first fallacy, "Therefore, no free being is unreasonable." You cannot quite agree because there is already a trick. Then you continue, "All human beings are free"—they all have free will. Now you triumphantly finish up, "Therefore no human being is unreasonable." That is complete nonsense.

[176] Let us assume that the dream is such an utterly nonsensical statement. This is perfectly plausible because obviously the dream is something like a nonsensical statement; otherwise you could understand it. As a rule you cannot understand it; you hardly ever come across dreams which are clear from beginning to end. The ordinary dream seems absolute nonsense and therefore one depreciates it. Even primitives, who make a great fuss about dreams, say that ordinary dreams mean nothing. But there are "big" dreams; medicine men and chiefs have big dreams, but ordinary men have no dreams. They talk exactly like people in Europe. Now you are confronted with that dream-nonsense, and you say, "This nonsense must be an insinuating distortion or fallacy which derives from an originally reasonable statement." You undo the whole thing and you apply the *reductio in primam figuram* and then you come to the initial undisturbed statement. So you see that the procedure of Freud's dream-interpretation is perfectly logical, if you assume that the statement of the dream is really nonsensical.

[177] But do not forget when you make the statement that a thing is unreasonable that perhaps you do not understand because you are not God; on the contrary, you are a fallible human being with a very limited mind. When an insane patient tells me something, I may think: "What that fellow is talking about is all nonsense." As a matter of fact, if I am scientific, I say "I do not understand," but if I am unscientific, I say "That fellow is just crazy and I am intelligent." This argumentation is the reason why men with somewhat unbalanced minds often like to become alienists. It is humanly understandable because it gives you a tremendous satisfaction, when you are not quite sure of yourself, to be able to say "Oh, the others are much worse."

[178] But the question remains: Can we safely say that a dream is nonsense? Are we quite sure that we know? Are we sure that the dream is a distortion? Are you absolutely certain when you discover something quite against your expectation that it is a mere distortion? Nature commits no errors. Right and wrong are human categories. The natural process is just what it is and nothing else—it is not nonsense and it is not unreasonable. We do not understand: that is the fact. Since I am not God and since I am a man of very limited intellectual capacities, I had better

assume that I do not understand dreams. With that assumption I reject the prejudiced view that the dream is a distortion, and I say that if I do not understand a dream, it is my mind which is distorted, I am not taking the right view of it.

[179] So I adopted the method which philologists apply to difficult texts, and I handle dreams in the same way. It is, of course, a bit more circumstantial and more difficult; but I can assure you that the results are far more interesting when you arrive at things that are human than when you apply a most dreadful monotonous interpretation. I hate to be bored. Above all we should avoid speculations and theories when we have to deal with such mysterious processes as dreams. We should never forget that for thousands of years very intelligent men of great knowledge and vast experience held very different views about them. It is only quite recently that we invented the theory that a dream is nothing. All other civilizations have had very different ideas about dreams.

[180] Now I will tell you the big dream of my patient: *"I am in the country, in a simple peasant's house, with an elderly, motherly peasant woman. I talk to her about a great journey I am planning: I am going to walk from Switzerland to Leipzig. She is enormously impressed, at which I am very pleased. At this moment I look through the window at a meadow where there are peasants gathering hay. Then the scene changes. In the background appears a monstrously big crab-lizard. It moves first to the left and then to the right so that I find myself standing in the angle between them as if in an open pair of scissors. Then I have a little rod or a wand in my hand, and I lightly touch the monster's head with the rod and kill it. Then for a long time I stand there contemplating that monster."*

[181] Before I go into such a dream I always try to establish a sequence, because this dream has a history before and will have a history afterwards. It is part of the psychic tissue that is continuous, for we have no reason to assume that there is no continuity in the psychological processes, just as we have no reason to think that there is any gap in the processes of nature. Nature is a continuum, and so our psyche is very probably a continuum. This dream is just one flash or one observation of psychic continuity that became visible for a moment. As a continuity it is

connected with the preceding dreams. In the previous dream we have already seen that peculiar snake-like movement of the train. This comparison is merely a hypothesis, but I have to establish such connections.

[182] After the train-dream the dreamer is back in the surroundings of his early childhood; he is with a motherly peasant woman—a slight allusion to the mother, as you notice. In the very first dream, he impresses the village boys by his magnificent appearance in the long coat of the Herr Professor. In this present dream too he impresses the harmless woman with his greatness and the greatness of his ambitious plan to walk to Leipzig—an allusion to his hope of getting a chair there. The monster crab-lizard is outside our empirical experience; it is obviously a creation of the unconscious. So much we can see without any particular effort.

[183] Now we come to the actual context. I ask him, "What are your associations to 'simple peasant's house'?" and to my enormous astonishment he says, "It is the lazar-house of St. Jacob near Basel." This house was a very old leprosery, and the building still exists. The place is also famous for a big battle fought there in 1444 by the Swiss against the troops of the Duke of Burgundy. His army tried to break into Switzerland but was beaten back by the avant-garde of the Swiss army, a body of 1,300 men who fought the Burgundian army consisting of 30,000 men at the lazar-house of St. Jacob. The 1,300 Swiss fell to the very last man, but by their sacrifice they stopped the further advance of the enemy. The heroic death of these 1,300 men is a notable incident in Swiss history, and no Swiss is able to talk of it without patriotic feeling.

[184] Whenever the dreamer brings such a piece of information, you have to put it into the context of the dream. In this case it means that the dreamer is in a leprosery. The lazar-house is called "Siechenhaus," sick-house, in German, the "sick" meaning the lepers. So he has, as it were, a revolting contagious disease; he is an outcast from human society, he is in the sick-house. And that sick-house is characterized, moreover, by that desperate fight which was a catastrophe for the 1,300 men and which was brought about by the fact that they did not obey orders. The avant-garde had strict instructions not to attack but to wait until the whole of the Swiss army had joined up with them. But as soon as they saw the enemy

they could not hold back and, against the commands of their leaders, made a headlong rush and attacked, and of course they were all killed. Here again we come to the idea of this rushing ahead without establishing a connection with the bulk of the tail-end, and again the action is fatal. This gave me a rather uncanny feeling, and I thought, “Now what is the fellow after, what danger is he coming to?” The danger is not just his ambition, or that he wishes to be with the mother and commit incest, or something of the kind. You remember, the engine-driver is a foolish fellow too; he runs ahead in spite of the fact that the tail-end of the train is not yet out of the curve; he does not wait for it, but rushes along without thinking of the whole. That means that the dreamer has the tendency to rush ahead, not thinking of his tail; he behaves as if he were his head only, just as the avant-garde behaved as if it were the whole army, forgetting that it had to wait; and because it did not wait, every man was killed. This attitude of the patient is the reason for his symptoms of mountain sickness. He went too high, he is not prepared for the altitude, he forgets where he started from.

[185] You know perhaps the novel by Paul Bourget, *L’Étape*. Its motif is the problem that a man’s low origin always clings to him, and therefore there are very definite limitations to his climbing the social ladder. That is what the dream tries to remind the patient of. That house and that elderly peasant woman bring him back to his childhood. It looks, then, as if the woman might refer to the mother. But one must be careful with assumptions. His answer to my question about the woman was “That is my landlady.” His landlady is an elderly widow, uneducated and old-fashioned, living naturally in a milieu inferior to his. He is too high up, and he forgets that the next part of his invisible self is the family in himself. Because he is a very intellectual man, feeling is his inferior function. His feeling is not at all differentiated, and therefore it is still in the form of the landlady, and in trying to impose upon that landlady he tries to impose upon himself with his enormous plan to walk to Leipzig.

[186] Now what does he say about the trip to Leipzig? He says, “Oh, that is my ambition. I want to go far, I wish to get a Chair.” Here is the headlong rush, here is the foolish attempt, here is the mountain sickness; he wants to climb too high. This dream was before the war, and at that time to be a

professor in Leipzig was something marvellous. His feeling was deeply repressed; therefore it does not have right values and is much too naïve. It is still the peasant woman; it is still identical with his own mother. There are many capable and intelligent men who have no differentiation of feeling, and therefore their feeling is still contaminated with the mother, is still in the mother, identical with the mother, and they have mothers' feelings; they have wonderful feelings for babies, for the interiors of houses and nice rooms and for a very orderly home. It sometimes happens that these individuals, when they have turned forty, discover a masculine feeling and then there is trouble.

[187] The feelings of a man are so to speak a woman's and appear as such in dreams. I designate this figure by the term *anima*, because she is the personification of the inferior functions which relate a man to the collective unconscious. The collective unconscious as a whole presents itself to a man in feminine form. To a woman it appears in masculine form, and then I call it the *animus*. I chose the term anima because it has always been used for that very same psychological fact. The anima as a personification of the collective unconscious occurs in dreams over and over again.[6] I have made long statistics about the anima figure in dreams. In this way one establishes these figures empirically.

[188] When I ask my dreamer what he means when he says that the peasant woman is impressed by his plan, he answers, "Oh, well, that refers to my boasting. I like to boast before an inferior person to show who I am; when I am talking to uneducated people I like to put myself very much in the foreground. Unfortunately I have always to live in an inferior milieu." When a man resents the inferiority of his milieu and feels that he is too good for his surroundings, it is because the inferiority of the milieu *in himself* is projected into the outer milieu and therefore he begins to mind those things which he should mind in himself. When he says, "I mind my inferior milieu," he ought to say, "I mind the fact that my own inner milieu is below the mark." He has no right values, he is inferior in his feeling-life. That is his problem.

[189] At this moment he looks out of the window and sees the peasants gathering hay. That, of course, again is a vision of something he has done in the past. It brings back to him memories of similar pictures and

situations; it was in summer and it was pretty hard work to get up early in the morning to turn the hay during the day and gather it in the evening. Of course, it is the simple honest work of such folk. He forgets that only the decent simple work gets him somewhere and not a big mouth. He also asserts, which I must mention, that in his present home he has a picture on the wall of peasants gathering hay, and he says, “Oh, that is the origin of the picture in my dream.” It is as though he said, “The dream is nothing but a picture on the wall, it has no importance, I will pay no attention to it.” At that moment the scene changes. When the scene changes you can always safely conclude that a representation of an unconscious thought has come to a climax, and it becomes impossible to continue that motif.

[190] Now in the next part of the dream things are getting dark; the crab-lizard appears, apparently an enormous thing. I asked, “What about the crab, how on earth do you come to that?” He said, “That is a mythological monster which walks backwards. The crab walks backwards. I do not understand how I get to this thing—probably through some fairytale or something of that sort.” What he had mentioned before were all things which you could meet with in real life, things which do actually exist. But the crab is not a personal experience, it is an archetype. When an analyst has to deal with an archetype he may begin to think. In dealing with the *personal* unconscious you are not allowed to think too much and to add anything to the associations of the patient. Can you add something to the personality of somebody else? You are a personality yourself. The other individual has a life of his own and a mind of his own inasmuch as he is a person. But inasmuch as he is not a person, inasmuch as he is also myself, he has the same basic structure of mind, and there I can begin to think, I can associate for him. I can even provide him with the necessary context because he will have none, he does not know where that crab-lizard comes from and has no idea what it means, but I know and can provide the material for him.

[191] I point out to him that the hero motif appears throughout the dreams. He has a hero fantasy about himself which comes to the surface in the last dream. He is the hero as the great man with the long coat and with the great plan; he is the hero who dies on the field of honour at St. Jacob;

he is going to show the world who he is; and he is quite obviously the hero who overcomes the monster. The hero motif is invariably accompanied by the dragon motif; the dragon and the hero who fights him are two figures of the same myth.

[192] The dragon appears in his dream as the crab-lizard. This statement does not, of course, explain what the dragon represents as an image of his psychological situation. So the next associations are directed round the monster. When it moves first to the left and then to the right the dreamer has the feeling that he is standing in an angle which could shut on him like open scissors. That would be fatal. He has read Freud, and accordingly he interprets the situation as an incest wish, the monster being the mother, the angle of the open scissors the legs of the mother, and he himself, standing in between, being just born or just going back into the mother.

[193] Strangely enough, in mythology, the dragon *is* the mother. You meet that motif all over the world, and the monster is called the mother dragon.[7] The mother dragon eats the child again, she sucks him in after having given birth to him. The "terrible mother," as she is also called, is waiting with wide-open mouth on the Western Seas, and when a man approaches that mouth it closes on him and he is finished. That monstrous figure is the mother sarcophaga, the flesh-eater; it is, in another form, Matuta, the mother of the dead. It is the goddess of death.

[194] But these parallels still do not explain why the dream chooses the particular image of the crab. I hold—and when I say I hold I have certain reasons for saying so—that representations of psychic facts in images like the snake or the lizard or the crab or the mastodon or analogous animals also represent organic facts. For instance, the serpent very often represents the cerebro-spinal system, especially the lower centres of the brain, and particularly the medulla oblongata and spinal cord. The crab, on the other hand, having a sympathetic system only, represents chiefly the sympathicus and para-sympathicus of the abdomen; it is an abdominal thing. So if you translate the text of the dream it would read: if you go on like this your cerebro-spinal system and your sympathetic system will come up against you and snap you up. That is in fact what is happening. The symptoms of his neurosis express the rebellion of the

sympathetic functions and of the cerebro-spinal system against his conscious attitude.

[195] The crab-lizard brings up the archetypal idea of the hero and the dragon as deadly enemies. But in certain myths you find the interesting fact that the hero is not connected with the dragon only by his fight. There are, on the contrary, indications that the hero is himself the dragon. In Scandinavian mythology the hero is recognized by the fact that he has snake's eyes. He has snake's eyes because he is a snake. There are many other myths and legends which contain the same idea. Cecrops, the founder of Athens, was a man above and a serpent below. The souls of heroes often appear after death in the form of serpents.

[196] Now in our dream the monstrous crab-lizard moves first to the left, and I ask him about this left side. He says, "The crab apparently does not know the way. Left is the unfavourable side, left is sinister." Sinister does indeed mean left and unfavourable. But the right side is also not good for the monster, because when it goes to the right it is touched by the wand and is killed. Now we come to his standing in between the angle of the monster's movement, a situation which at first glance he interpreted as incest. He says, "As a matter of fact, I felt surrounded on either side like a hero who is going to fight a dragon." So he himself realizes the hero motif.

[197] But unlike the mythical hero he does not fight the dragon with a weapon, but with a wand. He says, "From its effect on the monster it seems that it is a magical wand." He certainly does dispose of the crab in a magical way. The wand is another mythological symbol. It often contains a sexual allusion, and sexual magic is a means of protection against danger. You may remember, too, how during the earthquake at Messina[8] nature produced certain instinctive reactions against the overwhelming destruction.

[198] The wand is an instrument, and instruments in dreams mean what they actually are, the devices of man to concretize his will. For instance, a knife is my will to cut; when I use a spear I prolong my arm, with a rifle I can project my action and my influence to a great distance; with a telescope I do the same as regards my sight. An instrument is a mechanism which represents my will, my intelligence, my capability, and

my cunning. Instruments in dreams symbolize an analogous psychological mechanism. Now this dreamer's instrument is a magic wand. He uses a marvellous thing by which he can spirit away the monster, that is, his lower nervous system. He can dispose of such nonsense in no time, and with no effort at all.

[199] What does this actually mean? It means that he simply thinks that the danger does not exist. That is what is usually done. You simply think that a thing is not and then it is no more. That is how people behave who consist of the head only. They use their intellect in order to think things away; they reason them away. They say, "This is nonsense, therefore it cannot be and therefore it is not." That is what he also does. He simply reasons the monster away. He says, "There is no such thing as a crab-lizard, there is no such thing as an opposing will; I get rid of it, I simply think it away. I think it is the mother with whom I want to commit incest, and that settles the whole thing, for I shall not do it." I said, "You have killed the animal—what do you think is the reason why you contemplate the animal for such a long time?" He said, "Oh, well, yes, naturally it is marvellous how you can dispose of such a creature with such ease." I said, "Yes, indeed it is very marvellous!"

[200] Then I told him what I thought of the situation. I said, "Look here, the best way to deal with a dream is to think of yourself as a sort of ignorant child or ignorant youth, and to come to a two-million-year-old man or to the old mother of days and ask, 'Now, what do you think of me?' She would say to you, 'You have an ambitious plan, and that is foolish, because you run up against your own instincts. Your own restricted capabilities block the way. You want to abolish the obstacle by the magic of your thinking. You believe you can think it away by the artifices of your intellect, but it will be, believe me, matter for some afterthought.' "And I also told him this: "Your dreams contain a warning. You behave exactly like the engine-driver or like the Swiss who were foolhardy enough to run up against the enemy without any support behind them, and if you behave in the same way you will meet with a catastrophe."

[201] He was sure that such a point of view was much too serious. He was convinced that it is much more probable that dreams come from

incompatible wishes and that he really had an unrealized incestuous wish which was at the bottom of this dream; that he was conscious now of this incestuous wish and had got rid of it and now could go to Leipzig. I said, “Well then, bon voyage.” He did not return, he went on with his plans, and it took him just about three months to lose his position and go to the dogs. That was the end of him. He ran up against the fatal danger of that crab-lizard and would not understand the warning. But I do not want to make you too pessimistic. Sometimes there are people who really understand their dreams and draw conclusions which lead to a more favourable solution of their problems.

Discussion

Dr. Charles Brunton:

[202] I do not know whether it is fair to ask about the dreams of someone who is not here, but I have a small daughter five and a half years old who has recently had two dreams which awakened her at night. The first dream occurred in the middle of August, and she told me this: "I see a wheel, and it is rolling down a road and it burns me." That was all I could get out of her. I wanted her to draw a picture of it the next day, but she did not want to be bothered, so I left it. The other dream was about a week ago, and this time it was "a beetle that was pinching me." That was all I could get about it. I do not know whether you would like to comment on them. The only thing I would like to add is that she knows the difference between a beetle and a crab. She is very fond of animals.

Professor Jung:

[203] You have to consider that it is very difficult and not quite fair to comment on dreams of someone one does not know; but I will tell you as much as one can see from the symbolism. The beetle would, according to my idea, have to do with the sympathetic system. Therefore I should conclude from that dream that there are certain peculiar psychological processes going on in the child, which touch upon her sympathetic system, and this might arouse some intestinal or other abdominal disorder. The most cautious statement one could make would be to say that there is a certain accumulation of energy in the sympathetic system which causes slight disturbances. This is also borne out by the symbol of the fiery wheel. The wheel in her dream seems to be a sun-symbol, and in Tantric philosophy fire corresponds to the socalled *manipura chakra*, which is localized in the abdomen. In the prodromal symptoms of epilepsy you sometimes find the idea of a wheel revolving inside. This too expresses a manifestation of a sympathetic nature. The image of the revolving wheel reminds us of the wheel upon which Ixion was crucified.

The dream of the little girl is an archetypal dream, one of those strange archetypal dreams children occasionally have.

[204] I explain these archetypal dreams of children by the fact that when consciousness begins to dawn, when the child begins to feel that *he is*, he is still close to the original psychological world from which he has just emerged: a condition of deep unconsciousness. Therefore you find with many children an awareness of the contents of the collective unconscious, a fact which in some Eastern beliefs is interpreted as reminiscence of a former existence. Tibetan philosophy, for instance, speaks of the "Bardo" existence and of the condition of the mind between death and birth.[9] The idea of former existence is a projection of the psychological condition of early childhood. Very young children still have an awareness of mythological contents, and if these contents remain conscious too long, the individual is threatened by an incapacity for adaptation; he is haunted by a constant yearning to remain with or to return to the original vision. There are very beautiful descriptions of these experiences by mystics and poets.

[205] Usually at the age of four to six the veil of forgetfulness is drawn upon these experiences. However, I have seen cases of ethereal children, so to speak, who had an extraordinary awareness of these psychic facts and were living their life in archetypal dreams and could not adapt. Recently I saw a case of a little girl of ten who had some most amazing mythological dreams.[10] Her father consulted me about these dreams. I could not tell him what I thought because they contained an uncanny prognosis. The little girl died a year later of an infectious disease. She had never been born entirely.

Dr. Leonard F. Browne:

[206] I should like to ask Professor Jung a question with regard to the interpretation of the dreams he told us today. In view of the fact that the patient was unable to accept the interpretation, I should like to know whether that difficulty could have been overcome by some variation in the technique.

Professor Jung:

[207] If I had had the intention of being a missionary, or a saviour, I should have used a clever trick. I should have said to the patient, “Yes, that is the mother complex all right,” and we would have gone on talking that kind of jargon for several months and perhaps in the end I would have swung him round. But I know from experience that such a thing is not good; you should not cheat people even for their good. I do not want to cheat people out of their mistaken faith. Perhaps it was better for that man to go to the dogs than to be saved by wrong means. I never hinder people. When somebody says, “I am going to commit suicide if—,” I say, “If that is your intention, I have no objection.”

Dr. Browne:

[208] Did you have any evidence that the symptoms of mountain sickness were cured?

Professor Jung:

[209] The patient lost his neurosis in going down in life. That man did not belong at a height of 6,000 feet; he belonged lower down. He became inferior instead of being neurotic. Once I talked to the head of a great institution in America for the education of criminal children, and was told about a very interesting experience. They have two categories of children. The majority of them, when they come to the institution, feel ever so much better, they develop very nicely and normally and they eventually grow out of whatever their original evil was. The other category, the minority, become hysterical when they try to be nice and normal. Those are the born criminals whom you cannot change. They are normal when they do wrong. We also do not feel quite right when we are behaving perfectly, we feel much better when we are doing a bit of wrong. That is because we are not perfect. The Hindus, when they build a temple, leave one corner unfinished; only the gods make something perfect, man never can. It is much better to know that one is not perfect, then one feels much better. So it is with these children, and so it is with our patients. It is wrong to cheat people out of their fate and to help them to go beyond their level. If a man has it in him to be adapted, help him by

all means; but if it is really his task *not* to be adapted, help him by all means not to be adapted, because then he is all right.

[210] What would the world be like if all people were adapted? It would be boring beyond endurance. There must be some people who behave in the wrong way; they act as scapegoats and objects of interest for the normal ones. Think how grateful you are for detective novels and newspapers, so that you can say, “Thank heaven I am not that fellow who has committed the crime, I am a perfectly innocent creature.” You feel satisfaction because the evil people have done it for you. This is the deeper meaning of the fact that Christ as the redeemer was crucified between two thieves. These thieves in their way were also redeemers of mankind, they were the scapegoats.

Question:

[211] I would like to ask a question about the psychological functions, if that is not going too far back. In answering a question last night you said that there was no criterion for considering either of the four functions as being superior in itself and you further said that all the four functions would have to be equally differentiated in order to obtain full and adequate knowledge of the world. Do you mean, therefore, that it is possible in any given case for all the four functions to be equally differentiated or to be arrived at by education?

Professor Jung:

[212] I do not believe that it is humanly possible to differentiate all four functions alike, otherwise we would be perfect like God, and that surely will not happen. There will always be a flaw in the crystal. We can never reach perfection. Moreover, if we could differentiate the four functions equally we should only make them into consciously disposable functions. Then we would lose the most precious connection with the unconscious through the inferior function, which is invariably the weakest; only through our feebleness and incapacity are we linked up with the unconscious, with the lower world of the instincts and with our fellow beings. Our virtues only enable us to be independent. There we do not

need anybody, there we are kings; but in our inferiority we are linked up with mankind as well as with the world of our instincts. It would not even be an advantage to have all the functions perfect, because such a condition would amount to complete aloofness. I have no perfection craze. My principle is: for heaven's sake do not be perfect, but by all means try to be complete—whatever that means.

Question:

[213] May I ask what it means to be complete? Will you enlarge upon that?

Professor Jung:

[214] I must leave something to your own mental efforts. It is surely a most amusing enterprise, for instance, to think on your way home what it possibly means to be complete. We should not deprive people of the pleasure of discovering something. To be complete is a very great problem, and to talk of it is amusing, but to be it is the main thing.

Question:

[215] How do you fit mysticism into your scheme?

Professor Jung:

[216] Into what scheme?

Reply:

[217] The scheme of psychology and the psyche.

Professor Jung:

[218] Of course you should define what you mean by mysticism. Let us assume that you mean people who have mystical experience. Mystics are people who have a particularly vivid experience of the processes of the collective unconscious. Mystical experience is experience of archetypes.

Question:

[219] Is there any difference between archetypal forms and mystical forms?

Professor Jung:

[220] I make no distinction between them. If you study the phenomenology of mystical experience you will come across some very interesting things. For instance, you all know that our Christian heaven is a masculine heaven and that the feminine element is only tolerated. The Mother of God is not divine, she is only the arch-saint. She intercedes for us at the throne of God but she is not part of the Deity. She does not belong to the Trinity.

[221] Now some Christian mystics have a different experience. For instance we have a Swiss mystic, Niklaus von der Flüe.[11] He experienced a God and a Goddess. Then there was a mystic of the thirteenth century, Guillaume de Digulleville, who wrote the *Pèlerinage de l'âme de Jésus Christ*.[12] Like Dante, he had a vision of the highest paradise as "le ciel d'or," and there upon a throne one thousand times more bright than the sun sat le Roi, who is God himself, and beside him on a crystal throne of brownish hue, la Reine, presumably the Earth. This is a vision outside the Trinity idea, a mystical experience of an archetypal nature which includes the feminine principle. The Trinity is a dogmatic image based on an archetype of an exclusively masculine nature. In the Early Church the Gnostic interpretation of the Holy Ghost as feminine was declared a heresy.

[222] Dogmatic images, such as the Trinity, are archetypes which have become abstract ideas. But there are a number of mystical experiences inside the Church whose archetypal character is still visible. Therefore they sometimes contain a heretical or pagan element. Remember, for instance, St. Francis of Assisi. Only through the great diplomatic ability of Pope Boniface VIII could St. Francis be assimilated into the Church. You have only to think of his relation to animals to understand the difficulty. Animals, like the whole of Nature, were taboo to the Church. Yet there are sacred animals like the Lamb, the Dove, and, in the Early Church, the Fish, which are worshipped.

Question:

[223] Will Professor Jung give us his view on the psychological differences between the dissociation in hysteria and the dissociation in schizophrenia?

Professor Jung:

[224] In hysteria the dissociated personalities are still in a sort of interrelation, so that you always get the impression of a total person. With a hysterical case you can establish a rapport, you get a feeling reaction from the whole person. There is only a superficial division between certain memory compartments, but the basic personality is always present. In the case of schizophrenia that is not so. There you encounter only fragments, there is nowhere a whole. Therefore, if you have a friend or a relative whom you have known well and who becomes insane, you will get a tremendous shock when you are confronted with a fragmentary personality which is completely split up. You can only deal with one fragment at a time; it is like a splinter of glass. You do not feel the continuity of the personality any longer. While with a hysterical case you think: if I could only wipe away that sort of obscuration or that sort of somnambulism then we should have the sum-total of the personality. But with schizophrenia it is a deep dissociation of personality; the fragments cannot come together any more.

Question:

[225] Are there any more strictly psychological conceptions by which that difference can be expressed?

Professor Jung:

[226] There are certain borderline cases where you can stitch the parts together if you can reintegrate the lost contents. I will tell you of a case I had. A woman had been twice in a lunatic asylum with a typical schizophrenic attack. When she was brought to me she was better, but still in a state of hallucination. I saw that it was possible to reach the

split-off parts. Then I began to go through every detail of the experiences which she had had in the lunatic asylum with her; we went through all the voices and all the delusions, and I explained every fact to her so that she could associate them with her consciousness. I showed her what these unconscious contents were that came up during her insanity, and because she was an intelligent person, I gave her books to read so that she acquired a great deal of knowledge, chiefly mythological knowledge, by which she herself could stitch the parts together. The breaking lines were still there, of course, and whenever afterwards she had a new wave of disintegration I told her to try to draw or paint a picture of that particular situation in order to have a picture of the whole of herself which objectified her condition, and so she did. She brought me quite a number of pictures she had made, which had helped her whenever she felt she was falling apart again. In this way I have kept her afloat for about twelve years, and she has had no more attacks which necessitated her seclusion in an asylum. She could always manage to ward off the attacks by objectifying their contents. She told me, moreover, that when she had made such a picture she went to her books and read a chapter about some of its main features, in order to bring it into general connection with mankind, with what people know, with the collective consciousness, and then she felt right again. She said she felt adapted and she was no longer at the mercy of the collective unconscious.

[227] All cases are not as accessible as that one, as you will realize. I cannot cure schizophrenia in principle. Occasionally by great good chance I can synthetize the fragments. But I do not like to do it because it is frightfully difficult work.

LECTURE IV

The Chairman (Dr. Emanuel Miller):

[228] I shall not take any of Professor Jung’s time away from you but will merely express my great pleasure at the opportunity of being Chairman this evening. Only I am put to a grave disadvantage: I have not been able to attend the previous lectures and therefore I do not know to what depths of the unconscious Professor Jung has already led you, but I think he is going to continue tonight the presentation of his method of dream-analysis.

Professor Jung:

[229] The interpretation of a profound dream, such as our last one was, is never sufficient when it is left in the personal sphere. This dream contains an archetypal image, and that is always an indication that the psychological situation of the dreamer extends beyond the mere personal layer of the unconscious. His problem is no more entirely a personal affair, but something which touches upon the problems of mankind in general. The symbol of the monster is an indication of this. This symbol brings up the hero myth, and furthermore the association with the battle of St. Jacob, which characterizes the localization of the scene, appeals also to a general interest.

[230] The ability to apply a general point of view is of great therapeutic importance. Modern therapy is not much aware of this, but in ancient medicine it was well known that the raising of the personal disease to a higher and more impersonal level had a curative effect. In ancient Egypt, for instance, when a man was bitten by a snake, the priest-physician was called in, and he took from the temple library the manuscript about the myth of Rā and his mother Isis, and recited it. Isis had made a poisonous worm and hidden it in the sand, and the god Rā had stepped on the serpent and was bitten by it, so that he suffered terrible pain and was

threatened with death. Therefore the gods caused Isis to work a spell which drew the poison out of him.[1] The idea was that the patient would be so impressed by this narrative that he would be cured. To us this sounds quite impossible. We could not imagine that the reading of a story from *Grimm's Fairy Tales*, for instance, would cure typhoid fever or pneumonia. But we only take into account our rational modern psychology. To understand the effect we have to consider the psychology of the ancient Egyptians, which was quite different. And yet those people were not so very different. Even with us certain things can work miracles; sometimes spiritual consolation or psychological influence alone can cure, or at least will help to cure an illness. And of course it is all the more so with a person on a more primitive level and with a more archaic psychology.

[231] In the East a great amount of practical therapy is built upon this principle of raising the mere personal ailment into a generally valid situation, and ancient Greek medicine also worked with the same method. Of course the collective image or its application has to be in accordance with the particular psychological condition of the patient. The myth or legend arises from the archetypal material which is constellated by the disease, and the psychological effect consists in connecting the patient with the general human meaning of his particular situation. Snakebite, for instance, is an archetypal situation, therefore you find it as a motif in any number of tales. If the archetypal situation underlying the illness can be expressed in the right way the patient is cured. If no adequate expression is found, the individual is thrown back upon himself, into the isolation of being ill; he is alone and has no connection with the world. But if he is shown that his particular ailment is not his ailment only, but a general ailment—even a god's ailment—he is in the company of men and gods, and this knowledge produces a healing effect. Modern spiritual therapy uses the same principle: pain or illness is compared with the sufferings of Christ, and this idea gives consolation. The individual is lifted out of his miserable loneliness and represented as undergoing a heroic meaningful fate which is ultimately good for the whole world, like the suffering and death of a god. When an ancient Egyptian was shown that he was undergoing the fate of Ra, the sun-god, he was immediately

ranked with the Pharaoh, who was the son and representative of the gods, and so the ordinary man was a god himself, and this brought such a release of energy that we can understand quite well how he was lifted out of his pain. In a particular frame of mind people can endure a great deal. Primitives can walk on glowing coals and inflict the most terrible injuries on themselves under certain circumstances without feeling any pain. And so it is quite likely that an impressive and adequate symbol can mobilize the forces of the unconscious to such an extent that even the nervous system becomes affected and the body begins to react in a normal way again.

[232] In the case of psychological suffering, which always isolates the individual from the herd of so-called normal people, it is also of the greatest importance to understand that the conflict is not a personal failure only, but at the same time a suffering common to all and a problem with which the whole epoch is burdened. This general point of view lifts the individual out of himself and connects him with humanity. The suffering does not even have to be a neurosis; we have the same feeling in very ordinary circumstances. If for instance you live in a well-to-do community, and you suddenly lose all your money, your natural reaction will be to think that it is terrible and shameful and that you are the only one who is such an ass as to lose his money. But if everybody loses his money it is quite another matter and you feel reconciled to it. When other people are in the same hole as I am I feel much better. If a man is lost in the desert or quite alone on a glacier, or if he is the responsible leader of a group of men in a precarious situation, he will feel terrible. But when he is a soldier in a whole battalion that is lost, he will join the rest in cheering and making jokes, and will not realize the danger. The danger is not less, but the individual feels quite differently about it in a group than when he has to face it alone.

[233] Whenever archetypal figures appear in dreams, especially in the later stages of analysis, I explain to the patient that his case is not particular and personal, but that his psychology is approaching a level which is universally human. That outlook is very important, because a neurotic feels tremendously isolated and ashamed of his neurosis. But if he knows his problem to be general and not merely personal, it makes all the

difference. In the case of our dreamer, if I had been going on with the treatment I would have called the patient’s attention to the fact that the motif in his last dream was a general human situation. He himself in his associations had realized the hero-dragon conflict.

[234] The hero’s fight with the dragon, as the symbol of a typical human situation, is a very frequent mythological motif. One of the most ancient literary expressions of it is the Babylonian Creation Myth, where the hero-god Marduk fights the dragon Tiamat. Marduk is the spring-god and Tiamat is the mother-dragon, the primordial chaos. Marduk kills her and splits her in two parts. From one half he makes the heavens and from the other he makes the earth.[2]

[235] A more striking parallel to our case is the great Babylonian epos of Gilgamesh.[3] Gilgamesh is really an *arriviste par excellence*, a man of ambitious plans, like our dreamer, and a great king and hero. All the men are working for him like slaves to build a town with mighty walls. The women feel neglected and complain to the gods about their reckless tyrant. So the gods decide that something has to be done about it. Translated into psychological language this means: Gilgamesh is using his consciousness only, his head has wings and is detached from the body, and his body is going to say something about it. It will react with a neurosis, that is, by constellating a very opposite factor. How is this neurosis described in the poem? The gods decide to “call up,” that is to make, a man like Gilgamesh. They create Enkidu; yet he is in some ways different. The hair of his head is long, he looks like a cave-man, and he lives with the wild animals in the plains and drinks from the water-wells of the gazelles. Gilgamesh, being normal so far, has a perfectly normal dream about the intention of the gods. He dreams that a star falls down on his back, a star like a mighty warrior, and Gilgamesh is wrestling with him but cannot shake himself free. Finally he overcomes him and puts him down at his mother’s feet, and the mother “makes him equal” to Gilgamesh. The mother is a wise woman and interprets the dream for Gilgamesh so that he is ready to meet the danger. Enkidu is meant to fight Gilgamesh and bring him down, but Gilgamesh in a very clever way makes him his friend. He has conquered the reaction of his unconscious by cunning and will-power and he persuades his opponent that they are

really friends and that they can work together. Now things are going worse than ever.

[236] Although right in the beginning Enkidu has an oppressive dream, a vision of the underworld where the dead live, Gilgamesh is preparing for a great adventure. Like heroes, Gilgamesh and Enkidu start out together to overcome Humbaba, a terrible monster whom the gods have made guardian of their sanctuary on the cedar mountain. His voice roars like the tempest, and everybody who approaches the wood is overcome by weakness. Enkidu is brave and very strong, but he is nervous about the enterprise. He is depressed by bad dreams and pays a lot of attention to them, like the inferior man in ourselves whom we ridicule when that inferior part of ourselves feels superstitious about certain dates, and so on; the inferior man nevertheless continues to be nervous about certain things. Enkidu is very superstitious, he has had bad dreams on the way to the forest and has forebodings that things will go wrong. But Gilgamesh interprets the dreams optimistically. Again the reaction of the unconscious is cheated, and they succeed in bringing back Humbaba’s head triumphantly to their city.

[237] Now the gods decide to interfere, or rather it is a goddess, Ishtar, who tries to defeat Gilgamesh. The ultimate principle of the unconscious is the Eternal Feminine, and Ishtar, with true feminine cunning, makes wonderful promises to Gilgamesh if he will become her lover: he would be like a god and his power and wealth would increase beyond measure. But Gilgamesh does not believe a word of it, he refuses with insulting words and reproaches her for all her faithlessness and cruelty towards her lovers. Ishtar in her rage and fury persuades the gods to create an enormous bull, which descends from the heavens and devastates the country. A great fight begins, and hundreds of men are killed by the poisonous breath of the divine bull. But again Gilgamesh, with the help of Enkidu, slay him, and the victory is celebrated.

[238] Ishtar, overcome by rage and pain, descends to the wall of the city, and now Enkidu himself commits an outrage against her. He curses her and throws the member of the dead bull in her face. This is the climax, and now the peripeteia sets in. Enkidu has more dreams of an ominous nature and becomes seriously ill and dies.

[239] This means that the conscious separates from the unconscious altogether; the unconscious withdraws from the field, and Gilgamesh is now alone and overcome with grief. He can hardly accept the loss of his friend, but what torments him most is the fear of death. He has seen his friend die and is faced with the fact that he is mortal too. One more desire tortures him—to secure immortality. He sets out heroically to find the medicine against death, because he knows of an old man, his ancestor, who has eternal life and who lives far away in the West. So the journey to the underworld, the Nekyia, begins, and he travels to the West like the sun, through the door of the heavenly mountain. He overcomes enormous difficulties, and even the gods do not oppose his plan, although they tell him that he will seek in vain. Finally he comes to his destination and persuades the old man to tell him of the remedy. At the bottom of the sea he acquires the magic herb of immortality, the *pharmakon athanasias*, and he is bringing the herb home. Although he is tired of travelling he is full of joy because he has the wonderful medicine and does not need to be afraid of death any more. But while he is refreshing himself by bathing in a pool, a snake smells out the herb of immortality and steals it from him. After his return, he takes up new plans for the fortification of his city, but he finds no peace. He wants to know what happens to man after death and he finally succeeds in evoking Enkidu’s spirit, which comes up from a hole in the earth and gives Gilgamesh very melancholy information. With this the epos ends. The ultimate victory is won by the cold-blooded animal.

[240] There are quite a number of dreams recorded from antiquity with parallel motifs, and I will give you a short example of how our colleagues of old—the dream interpreters of the first century A.D.—proceeded. The story is told by Flavius Josephus in his history of the Jewish war,[4] where he also records the destruction of Jerusalem.

[241] There was a Tetrarch of Palestine by the name of Archelaos, a Roman governor who was very cruel and who, like practically all of those provincial governors, regarded his position as an opportunity to enrich himself and steal what he could lay his hands on. Therefore a delegation was sent to the emperor Augustus to complain about him. This was in the tenth year of Archelaos’ governorship. About this time he had a dream in

which he saw nine big ripe ears of wheat which were eaten up by hungry oxen. Archelaos was alarmed and instantly called in his court psychoanalyst. But the psychoanalyst did not know what the dream meant, or he was afraid to tell the truth and wriggled out of it. Archelaos called in other psychoanalysts for consultation, and they in the same way refused to know anything about the dream.

[242] But there was a peculiar sect of people, the Essenes or Therapeutai, with more independent minds. They lived in Egypt and near the Dead Sea, and it is not impossible that John the Baptist as well as Simon Magus belonged to such circles. So as a last resort a man called Simon the Essene was sent for, and he told Archelaos: “The ears of wheat signify the years of your reign, and the oxen the change of things. The nine years are fulfilled and there will be a great change in your fate. The hungry oxen mean your destruction.” In those countries such a dream-image would be perfectly understandable. The fields have to be guarded carefully against foraging cattle. There is little grass, and it is a catastrophe when during the night the oxen break through the fence into the field and trample down and eat the growing grain, so that in the morning the whole bread of a year is gone. Now for the confirmation of the interpretation. A few days later a Roman ambassador arrived to investigate, dismissed Archelaos, took all his property from him, and exiled him to Gaul.

[243] Archelaos was married, and his wife, Glaphyra, also had a dream. Naturally she was impressed by what had happened to her husband. She dreamt of her first husband—Archelaos was her third marriage—who had been disposed of in a very impolite way: he had been murdered, and Archelaos was most probably the murderer. Things were a bit rough in those days. This former husband, Alexandros, appeared to her in the dream and blamed her for her conduct and told her that he was going to take her back into his household. Simon did not interpret this dream, so the analysis is left to our discretion. The important fact is that Alexandros was dead, and that Glaphyra saw the dead husband in her dream. This, of course, in those days, meant the ghost of that person. So when he told her that he was going to take her back to his household it signified that he

was going to fetch her to Hades. And indeed, a few days later she committed suicide.

[244] The way the dream-interpreter proceeded with the dream of Archelaos was very sensible. He understood the dream exactly as we would, although these dreams are of a much simpler nature than most of our dreams. I have noticed that dreams are as simple or as complicated as the dreamer is himself, only they are always a little bit ahead of the dreamer's consciousness. I do not understand my own dreams any better than any of you, for they are always somewhat beyond my grasp and I have the same trouble with them as anyone who knows nothing about dream-interpretation. Knowledge is no advantage when it is a matter of one's own dreams.

[245] Another interesting parallel to our case is the story you all know in the fourth chapter of the Book of Daniel.[5] When the king Nebuchadnezzar had conquered the whole of Mesopotamia and Egypt, he thought he was very great indeed because he possessed the whole known world. Then he had the typical dream of the *arriviste* who has climbed too high. He dreamed of an enormous tree growing up to heaven and casting a shadow over the whole earth. But then a watcher and holy one from heaven ordered the tree to be hewn down, and his branches cut off, and his leaves shaken, so that only his stump remained; and that he should live with the beasts and his human heart be taken from him and a beast's heart given to him.

[246] Of course all the astrologers and wise men and dream-interpreters refused to understand the dream. Only Daniel, who already in the second chapter had proved himself a courageous analyst—he even had a vision of a dream which Nebuchadnezzar could not remember—understood its meaning. He warned the king to repent of his avarice and injustice, otherwise the dream would come true. But the king went on as before, very proud of his power. Then a voice from heaven cursed him and repeated the prophecy of the dream. And it all happened as foretold. Nebuchadnezzar was cast out to the beasts and he became like an animal himself. He ate grass as the oxen and his body was wet with the dew of heaven, his hair grew long like eagles' feathers and his nails like birds' claws. He was turned back into a primitive man and all his conscious

reason was taken away because he had misused it. He regressed even further back than the primitive and became completely inhuman; he was Humbaba, the monster, himself. All this symbolized a complete regressive degeneration of a man who has overreached himself.

[247] His case, like our patient's, is the eternal problem of the successful man who has overreached himself and is contradicted by his unconscious. The contradiction is first shown in the dreams and, if not accepted, must be experienced in reality in a fatal way. These historical dreams, like all dreams, have a *compensatory function:* they are an indication—a symptom, if you prefer to say so—that the individual is at variance with unconscious conditions, that somewhere he has deviated from his natural path. Somewhere he has fallen a victim to his ambition and his ridiculous designs, and, if he does not pay attention, the gap will widen and he will fall into it, as our patient has.

[248] I want to emphasize that it is not safe to interpret a dream without going into careful detail as to the context. Never apply any theory, but always ask the patient how *he* feels about his dream-images. For dreams *are always* about a particular problem of the individual about which he has a wrong conscious judgment. The dreams are the reaction to our conscious attitude in the same way that the body reacts when we overeat or do not eat enough or when we ill-treat it in some other way. *Dreams are the natural reaction of the self-regulating psychic system*. This formulation is the nearest I can get to a theory about the structure and function of dreams. I hold that dreams are just as manifold and unpredictable and incalculable as a person you observe during the day. If you watch an individual at one moment and then at another you will see and hear the most varied reactions, and it is exactly the same with dreams. In our dreams we are just as many-sided as in our daily life, and just as you cannot form a theory about those many aspects of the conscious personality you cannot make a general theory of dreams. Otherwise we would have an almost divine knowledge of the human mind, which we certainly do not possess. We know precious little about it, therefore we call the things we do not know unconscious.

[249] But today I am going to contradict myself and break all my rules. I am going to interpret a single dream, not one out of a series; moreover I

do not know the dreamer, and further, I am not in possession of the associations. Therefore I am interpreting the dream arbitrarily. There is a justification for this procedure. If a dream is clearly formed of *personal* material you have to get the individual associations; but if the dream is chiefly a *mythological* structure—a difference which is obvious at once—then it speaks a universal language, and you or I can supply parallels with which to construct the context as well as anybody else, always provided we possess the necessary knowledge. For instance, when the dream takes up the hero-dragon conflict, everybody has something to say about it, because we have all read fairytales and legends and know something of heroes and dragons. On the collective level of dreams there is practically no difference in human beings, while there is all the difference on the personal level.

[250] The main substance of the dream I am going to speak of is mythological. Here we are confronted with the question: Under what conditions does one have mythological dreams? With us they are rather rare, as our consciousness is to a great extent detached from the underlying archetypal mind. Mythological dreams therefore are felt by us as a very alien element. But this is not so with a mentality nearer to the primordial psyche. Primitives pay great attention to such dreams and call them “big dreams” in contradistinction to ordinary ones. They feel that they are important and contain a general meaning. Therefore in a primitive community the dreamer feels bound to announce a big dream to the assembly of men, and a palaver is held over it. Such dreams were also announced to the Roman Senate. There is a story of a senator’s daughter in the first century B.C. who dreamed that the goddess Minerva had appeared to her and complained that the Roman people were neglecting her temple. The lady felt obliged to report the dream to the Senate, and the Senate voted a certain sum of money for the restoration of the temple. A similar case is told of Sophocles, when a precious golden vessel had been stolen from the temple of Herakles. The god appeared to Sophocles in a dream and told him the name of the thief.[6] After the third repetition of the dream, Sophocles felt obliged to inform the Areopagus. The man in question was seized, and in the course of the investigation he confessed and brought back the vessel. These mythological or collective

dreams have a character which forces people instinctively to tell them. This instinct is quite appropriate, because such dreams do not belong to the individual; they have a collective meaning. They are true in themselves in general, and in particular they are true for people in certain circumstances. That is the reason why in antiquity and in the Middle Ages dreams were held in great esteem. It was felt that they expressed a collective human truth.

[251] Now I will tell you the dream. It was sent to me by a colleague of mine years ago with a few remarks about the dreamer. My colleague was an alienist at a clinic, and the patient was a distinguished young Frenchman, twenty-two years of age, highly intelligent, and vesy aesthetic. He had travelled in Spain and had come back with a depression which was diagnosed as manic-depressive insanity, depressive form. The depression was not very bad, but bad enough for him to be sent to the clinic. After six months he was released from confinement, and a few months later he committed suicide. He was no longer under the depression, which was practically cured; he committed suicide apparently in a state of calm reasoning. We shall understand from the dream why he committed suicide. This is the dream, and it occurred at the beginning of the depression:

Underneath the great cathedral of Toledo there is a cistern filled with water which has a subterranean connection with the river Tagus, which skirts the city. This cistern is a small dark room. In the water there is a huge serpent whose eyes sparkle like jewels. Near it there is a golden bowl containing a golden dagger. This dagger is the key to Toledo, and its owner commands full power over the city. The dreamer knows the serpent to be the friend and protector of B— C—, a young friend of his who is present. B— C— puts his naked foot into the serpent's jaws. The serpent licks it in a friendly way and B— C— enjoys playing with the serpent; he has no fear of it because he is a child without guile. In the dream B— C— appears to be about the age of seven; he had indeed been a friend of the dreamer's early youth. Since this time, the dream says, the serpent has been forgotten and nobody dared to descend into its haunts.

[252] This part is a sort of introduction, and now the real action begins.

The dreamer is alone with the serpent. He talks to it respectfully, but without fear. The serpent tells the dreamer that Spain belongs to him as he is B— C—'s friend, and asks him to give back the boy. The dreamer refuses to do this and promises instead that he himself will descend into the darkness of the cave to be the friend of the serpent. But then he changes his mind, and instead of fulfilling his promise he decides to send another friend, a Mr. S—, to the serpent. This friend is descended from the Spanish Moors, and to risk the descent into the cistern he has to recover the original courage of his race. The dreamer advises him to get the sword with the red hilt which is to be found in the weapons factory on the other bank of the Tagus. It is said to be a very ancient sword, dating back to the old Phocaeans.[7] *S— gets the sword and descends into the cistern, and the dreamer tells him to pierce his left palm with the sword. S — does so, but he is not able to keep his countenance in the powerful presence of the serpent. Overcome by pain and fear, he cries out and staggers up the stairs again without having taken the dagger. Thus the dreamer cannot hold Toledo, and he could do nothing about it and had to leave his friend there as a mere wall decoration.*

[252a]. That is the end of the dream. The original of course is in French. Now for the context. We have certain hints as to these friends. B— C— is a friend of the dreamer's early youth, a little bit older than himself, and he projected everything that was wonderful and charming into this boy and made him a sort of hero. But he lost sight of him later; perhaps the boy died. S— is a friend of more recent date. He is said to be descended from the Spanish Moors. I do not know him personally, but I know his family. It is a very old and honourable family from the South of France, and the name might easily be a Moorish name. The dreamer knew this legend about the family of S—

[253] As I told you, the dreamer had recently been to Spain and of course had seen Toledo, and he had the dream after he got back and had been taken to the clinic. He was in a bad state, practically in despair, and he could not help telling the dream to his doctor. My colleague did not know what to do with it, but he felt an urge to send me the dream because he felt it to be very important. But at the time I received the dream I could not understand it. Nevertheless I had the feeling; that if I had known

something more about such dreams, and if I could have handled the case myself, I might have been able to help the young man and his suicide might not have occurred. Since then I have seen many cases of a similar nature. Often one can turn a difficult corner by a real understanding of dreams like this one. With such a sensitive, refined individual who had studied the history of art and was an unusually artistic and intelligent person, one must be exceedingly careful. Banalities are no use in such a case; one has to be serious and enter into the real material.

[253a] We make no mistake when we assume that the dreamer has picked out Toledo for a particular reason—both as the object of his trip and of his dream; and the dream brings up material which practically everybody would have who had seen Toledo with the same mental disposition, the same education and refinement of aesthetic perception and knowledge. Toledo is an extremely impressive city. It contains one of the most marvellous Gothic cathedrals of the world. It is a place with an immensely old tradition; it is the old Roman Toletum, and for centuries has been the seat of the Cardinal Archbishop and Primate of Spain. From the sixth to the eighth century it was the capital of the Visigoths; from the eighth to the eleventh it was a provincial capital of the Moorish kingdom; and from the eleventh to the sixteenth century it was the capital of Castile. The cathedral of Toledo, being such an impressive and beautiful building, naturally suggests all that it represents: the greatness, the power, the splendour, and the mystery of medieval Christianity, which found its essential expression in the Church. Therefore the cathedral is the embodiment, the incarnation, of the spiritual kingdom, for in the Middle Ages the world was ruled by the Emperor *and* by God. So the cathedral expresses the Christian philosophy or *Weltanschauung* of the Middle Ages.

[254] The dream says that underneath the cathedral there is a mysterious place, which in reality is not in tune with a Christian church. What is beneath a cathedral of that age? There is always the so-called under-church or crypt. You have probably seen the great crypt at Chartres; it gives a very good idea of the mysterious character of a crypt. The crypt at Chartres was previously an old sanctuary with a well, where the worship of a virgin was celebrated—not of the Virgin Mary, as is done now—but

of a Celtic goddess. Under every Christian church of the Middle Ages there is a secret place where in old times the mysteries were celebrated. What we now call the sacraments of the Church were the mysteria of early Christianity. In Provençal the crypt is called *le musset*, which means a secret; the word perhaps originates from *mysteria* and could mean mystery-place. In Aosta, where they speak a Provençal dialect, there is a *musset* under the cathedral.

[255] The crypt is probably taken over from the cult of Mithras. In Mithraism the main religious ceremony took place in a vault half sunk into the earth, and the community remained separated in the main church above. There were peepholes so that they could see and hear the priests and the elect ones chanting and celebrating their rites below, but they were not admitted to them. That was a privilege for the initiates. In the Christian church the separation of the baptistry from the main body of the building derives from the same idea, for baptism as well as the communion were mysteria of which one could not speak directly. One had to use a sort of allegorical allusion so as not to betray the secrets. The mystery also attached to the name of Christ, which therefore was not allowed to be mentioned; instead, he was referred to by the name of Ichthys, the Fish. You have probably seen reproductions of very early Christian paintings where Christ appears as the Fish. This secrecy connected with the holy name is probably the reason why the name of Christ is not mentioned in an early Christian document of about A.D. 140 known as *The Shepherd* of Hermas,[8] which was an important part of the body of Christian literature recognized by the Church till about the fifth century. The writer of this book of visions, Hermas, is supposed to have been the brother of the Roman bishop Pius. The spiritual teacher who appears to Hermas is called the Poimen, the Shepherd, and not the Christ.

[256] The idea of the crypt or mystery-place leads us to something below the Christian *Weltanschauung*, something older than Christianity, like the pagan well below the cathedral at Chartres, or like an antique cave inhabited by a serpent. The well with the serpent is of course not an actual fact which the dreamer saw when he travelled in Spain. This dream-image is not an individual experience and can therefore only be paralleled by archaeological and mythological knowledge. I have to give

you a certain amount of that parallelism so that you can see in what context or tissue such a symbolical arrangement appears when looked at in the light of comparative research work. You know that every church still has its baptismal font. This was originally the *piscina*, the pond, in which the initiates were bathed or symbolically drowned. After a figurative death in the baptismal bath they came out transformed *quasi modo geniti*, as reborn ones. So we can assume that the crypt or baptismal font has the meaning of a place of terror and death and also of rebirth, a place where dark initiations take place.

[257] The serpent in the cave is an image which often occurs in antiquity. It is important to realize that in classical antiquity, as in other civilizations, the serpent not only was an animal that aroused fear and represented danger, but also signified healing. Therefore Asklepios, the god of physicians, is connected with the serpent; you all know his emblem which is still in use. In the temples of Asklepios, the Asklepieia, which were the ancient clinics, there was a hole in the ground, covered by a stone, and in that hole lived the sacred serpent. There was a slot in the stone through which the people who came to the place of healing threw down the fee for the doctors. The snake was at the same time the cashier of the clinic and collector of gifts that were thrown down into its cave. During the great pestilence in the time of Diocletian the famous serpent of the Asklepieion at Epidaurus was brought to Rome as an antidote to the epidemic. It represented the god himself.

[258] The serpent is not only the god of healing; it also has the quality of wisdom and prophecy. The fountain of Castalia at Delphi was originally inhabited by a python. Apollo fought and overcame the python, and from that time Delphi was the seat of the famous oracle and Apollo its god, until he left half his powers to Dionysus, who later came in from the East. In the underworld, where the spirits of the dead live, snakes and water are always together, as we can read in Aristophanes' *The Frogs*. The serpent in legend is often replaced by the dragon; the Latin *draco* simply means snake. A particularly suggestive parallel to our dream symbol is a Christian legend of the fifth century about St. Sylvester:[9] there was a terrible dragon in a cave under the Tarpeian rock in Rome to whom virgins were sacrificed. Another legend says that the dragon was

not a real one but artificial, and that a monk went down to prove it was not real and when he got down to the cave he found that the dragon had a sword in his mouth and his eyes consisted of sparkling jewels.

[259] Very often these caves, like the cave of Castalia, contain springs. These springs played a very important role in the cult of Mithras, from which many elements of the early Church originated. Porphyry relates that Zoroaster, the founder of the Persian religion, dedicated to Mithras a cave containing many springs. Those of you who have been to Germany and seen the Saalburg near Frankfurt will have noticed the spring near the grotto of Mithras. The cult of Mithras is always connected with a spring. There is a beautiful Mithraeum in Provence which has a large piscina with wonderful crystal-clear water, and in the background a rock on which is carved the Mithras Tauroktonos—the bull-killing Mithras. These sanctuaries were always a great scandal to the early Christians. They hated all these natural arrangements because they were no friends of nature. In Rome a Mithraeum has been discovered ten feet below the surface of the Church of San Clemente. It is still in good condition but filled with water, and when it is pumped out it fills again. It is always under water because it adjoins a spring which floods the interior. The spring has never been found. We know of other religious ideas in antiquity, for instance of the Orphic cult, which always associate the underworld with water.

[260] This material will give you an idea that the serpent in the cave full of water is an image that was generally known and played a great role in antiquity. As you have noticed, I have chosen all my examples exclusively from antiquity; I could have chosen other parallels from other civilizations, and you would find it was the same. The water in the depths represents the unconscious. In the depths as a rule is a treasure guarded by a serpent or a dragon; in our dream the treasure is the golden bowl with the dagger in it. In order to recover the treasure the dragon has to be overcome. The treasure is of a very mysterious nature. It is connected with the serpent in a strange way; the peculiar nature of the serpent denotes the character of the treasure as though the two things were one. Often there is a golden snake with the treasure. Gold is something that everyone is seeking, so we could say that it looks as if the serpent himself

were the great treasure, the source of immense power. In early Greek myths, for instance, the dweller in the cave is a hero, such as Cecrops, the founder of Athens. Above he is half man and half woman, a hermaphrodite, but the lower part of his body is a serpent; he is clearly a monster. The same is said of Erechtheus, another mythical king of Athens.

[261] That prepares us a little for understanding the golden bowl and the dagger in our dream. If you have seen Wagner's *Parsifal* you know that the bowl corresponds to the Grail and the dagger to the spear and that the two belong together; they are the male and the female principle which form the union of opposites. The cave or underworld represents a layer of the unconscious where there is no discrimination at all, not even a distinction between the male and the female, which is the first differentiation primitives make. They distinguish objects in this way, as we still do occasionally. Some keys, for instance, have a hole in the front, and some are solid. They are often called male and female keys. You know the Italian tiled roofs. The convex tiles are placed above and the concave ones underneath. The upper ones are called monks and the under ones the nuns. This is not an indecent joke to the Italians, but the quintessence of discrimination.

[262] When the unconscious brings together the male and the female, things become utterly indistinguishable and we cannot say any more whether they are male or female, just as Cecrops came from such a mythical distance that one could not say whether he was man or woman, human or serpent. So we see that the bottom of the cistern in our dream is characterized by a complete union of opposites. This is the primordial condition of things, and at the same time a most ideal achievement, because it is the union of elements eternally opposed. Conflict has come to rest, and everything is still or once again in the original state of indistinguishable harmony. You find the same idea in ancient Chinese philosophy. The ideal condition is named Tao, and it consists of the complete harmony between heaven and earth. Figure 13 represents the symbol for Tao. On one side it is white with a black spot, and on the other it is black with a white spot. The white side is the hot, dry, fiery principle, the south; the black side is the cold, humid, dark principle, the

north. The condition of Tao is the beginning of the world where nothing has yet begun—and it is also the condition to be achieved by the attitude of superior wisdom. The idea of the union of the two opposite principles, of male and female, is an archetypal image. I once had a very nice example of its still-living primitive form. When on military duty with the army during the war, I was with the mountain artillery, and the soldiers had to dig a deep hole for the position of a heavy gun. The soil was very refractory, and they cursed a good deal while they were digging up the heavy blocks. I was sitting hidden behind a rock, smoking my pipe and listening to what they said. One man said: "Now, damn it all, we have dug into the depths of this blooming old valley where the old lake-dwellers lived and where father and mother are still sleeping together." That is the same idea, very naïvely expressed. A Negro myth says that the primordial man and the primordial woman were sleeping together in the calabash; they were quite unconscious until they found they were torn asunder and what was in between was the son. Man was in between, and from that time they were separated, and then they knew each other. The original condition of absolute unconsciousness is expressed as a completely restful condition where nothing happens.

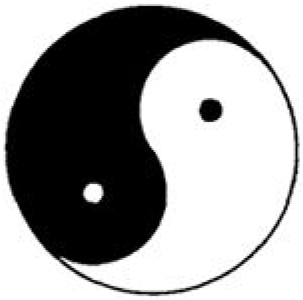

FIG. 13. Tao

[263] When the dreamer comes to these symbols he reaches the layer of complete unconsciousness, which is represented as the greatest treasure. It is the central motif in Wagner's *Parsifal* that the spear should be restored to the Grail because they belong eternally together. This union is a symbol of complete fulfilment—eternity before and after the creation of the world, a dormant condition. That is probably the thing which the desire of man is seeking. That is why he ventures into the cave of the dragon, to find that condition where consciousness and the unconscious

are so completely united that he is neither conscious nor unconscious. Whenever the two are too much separated, consciousness seeks to unite them again by going down into the depths where they once were one. Thus you find in Tantric Yoga or Kundalini Yoga an attempt to reach the condition where Shiva is in eternal union with Shakti. Shiva is the eternally unextended point, and he is encircled by the female principle, Shakti, in the form of a serpent.

[264] I could give you many more instances of this idea. It played a great role in the secret tradition of the Middle Ages. In medieval alchemical texts there are pictures of the process of the union of Sol and Luna, the male and the female principle. We have traces of an analogous symbolism in Christian reports about the ancient mysteries. There is a report by a Bishop Asterios about Eleusis, and it says that every year the priest made the *katabasis* or descent into the cave. And the priest of Apollo and the priestess of Demeter, the earth mother, celebrated the *hierosgamos*, the sacred nuptials, for the fertilization of the earth. This is a Christian statement which is not substantiated. The initiates of the Eleusinian mysteries were sworn to the strictest secrecy; if they betrayed anything, they were punished with death. So we have practically no knowledge of their rites. We know, on the other hand, that during the mysteries of Demeter certain obscenities took place because they were thought good for the fertility of the earth. The distinguished ladies of Athens assembled, with the priestess of Demeter presiding. They had a good meal and plenty of wine and afterwards performed the rite of the *aischrologia*. That is, they had to tell indecent jokes. This was considered a religious duty because it was good for the fertility of the next season.[10] A similar rite took place in Bubastis in Egypt at the time of the Isis mysteries. The inhabitants of the villages on the upper Nile came down in parties, and the women on the barges used to expose themselves to the women on the banks of the Nile. It was probably done for the same reason as the *aischrologia*, to ensure the fertility of the earth. You can read about it in Herodotus.[11] In southern Germany as late as the nineteenth century, in order to increase the fertility of the soil, the peasant used to take his wife to his fields and have intercourse with her in a furrow. This is called sympathetic magic.

[265] The bowl is a vessel that receives or contains, and is therefore female. It is a symbol of the body which contains the anima, the breath and liquid of life, while the dagger has piercing, penetrating qualities and is therefore male. It cuts, it discriminates and divides, and so is a symbol of the masculine Logos principle.

[266] In our dream the dagger is said to be the key to Toledo. The idea of the key is often associated with the mysteries in the cave. In the cult of Mithras there is a peculiar kind of god, the key god Aion, whose presence could not be explained; but I think it is quite understandable. He is represented with the winged body of a man and the head of a lion, and he is encoiled by a snake which rises up over his head.[12] You have a figure of him in the British Museum. He is Infinite Time and Long Duration; he is the supreme god of the Mithraic hierarchy and creates and destroys all things, the *durée créatrice* of Bergson. He is a sun-god. Leo is the zodiacal sign where the sun dwells in summer, while the snake symbolizes the winter or wet time. So Aion, the lion-headed god with the snake round his body, again represents the union of opposites, light and darkness, male and female, creation and destruction. The god is represented as having his arms crossed and holding a key in each hand. He is the spiritual father of St. Peter, for he too holds the keys. The keys which Aion is holding are the keys to the past and future.

[267] The ancient mystery cults are always connected with psychopompic deities. Some of these deities are equipped with the keys to the underworld, because as the guardians of the door they watch over the descent of the initiates into the darkness and are the leaders into the mysteries. Hecate is one of them.

[268] In our dream the key is the key to the city of Toledo, so we have to consider the symbolic meaning of Toledo and of the city. As the old capital of Spain, Toledo was a very strong fortification and the very ideal of a feudal city, a refuge and stronghold which could not easily be touched from outside. The city represents a totality, closed in upon itself, a power which cannot be destroyed, which has existed for centuries and will exist for many centuries more. Therefore the city symbolizes the totality of man, an attitude of wholeness which cannot be dissolved.

[269] The city as a synonym for the self, for psychic totality, is an old and well-known image. We read for instance in the Oxyrhynchus sayings of Jesus:[13] "A city built upon the top of a high hill and stablished, can neither fall nor be hid." And: "Strive therefore to know yourselves, and ye shall be aware that ye are the sons of the almighty Father; and ye shall know that ye are in the city of God and ye are the city." There is a Coptic treatise in the Codex Brucianus in which we find the idea of the Monogenes, or only son of God, who is also the Anthropos, Man.[14] He is called the city with the four gates. The city with the four gates symbolizes the idea of totality; it is the individual who possesses the four gates to the world, the four psychological functions, and so is contained in the self. The city with the four gates is his indestructible wholeness—consciousness and the unconscious united.

[270] So these depths, that layer of utter unconsciousness in our dream, contain at the same time the key to individual completeness and wholeness, in other words to healing. The meaning of "whole" or "wholeness" is to make holy or to heal. The descent into the depths will bring healing. It is the way to the total being, to the treasure which suffering mankind is forever seeking, which is hidden in the place guarded by terrible danger. This is the place of primordial unconsciousness and at the same time the place of healing and redemption, because it contains the jewel of wholeness. It is the cave where the dragon of chaos lives and it is also the indestructible city, the magic circle or *temenos*, the sacred precinct where all the split-off parts of the personality are united.

[271] The use of a magic circle or mandala, as it is called in the East, for healing purposes is an archetypal idea. When a man is ill the Pueblo Indians of New Mexico make a sand-painting of a mandala with four gates. In the centre of it they build the socalled sweat-house or medicine-lodge, where the patient has to undergo the sweat-cure. On the floor of the medicine-lodge is painted another magic circle—being thus placed in the centre of the big mandala—and in the midst of it is the bowl with the healing water. The water symbolizes the entrance to the underworld. The healing process in this ceremony is clearly analogous to the symbolism which we find in the collective unconscious. It is an individuation

process, an identification with the totality of the personality, with the self. In Christian symbolism the totality is Christ, and the healing process consists of the *imitatio Christi*. The four gates are replaced by the four arms of the cross.

[272] The serpent in the cave in our dream is the friend of B— C—, the hero of the dreamer’s early days, into whom he projected everything he wanted to become and all the virtues to which he was aspiring. That young friend is at peace with the serpent. He is a child without guile, he is innocent and knows as yet of no conflict. Therefore he has the key to Spain and the power over the four gates.[15]

Discussion

Dr. David Yellowlees:

[273] I need hardly mention that I shall not attempt to discuss anything that has been said tonight. We are all glad Professor Jung has given us such an extraordinarily fascinating account of his own views, rather than spend time on controversial matters. But I think some of us would be grateful if he would recognize that we approach psychology and psychotherapy along lines not exclusively Freudian perhaps, but in accordance with certain fundamental principles with which Freud's name is associated, though he may not have originated them. We are very grateful that Professor Jung has given us what we believe to be a wider view. Some of us prefer that view, and perhaps the Freudians would be able to tell us why. But the question was raised the other night as to the relationship between the concept of the unconscious which Professor Jung has been laying before us and Freud's concept of it, and I think if Professor Jung will be so good he could help us a little in that direction. I know quite well I may be misinterpreting him, but the impression I got on Tuesday night was almost as if he had said that he was dealing with facts and Freud with theories. He knows as well as I do that this bald statement really requires some amplification and I wish he could tell us, for example, what we ought to do from a therapeutic point of view when faced with a patient who produces spontaneously what I would call Freudian material, and how far we should regard Freudian theories simply as theories in view of the evidence which can be proved by such material as infantile fixation of the libido—oral, anal, phallic, and so on. If Professor Jung would say a little to give us some kind of correlation we would be very grateful.

Professor Jung:

[274] I told you at the beginning that I do not want to be critical. I just want to give you a point of view of my own, of how I envisage psychological

material, and I suppose that when you have heard what I have to contribute you will be able to make up your minds about these questions, and how much of Freud, how much of Adler, or myself, or I do not know whom, you will want to follow. If you want me to elucidate the question of the connection with Freud, I am quite glad to do it. I started out entirely on Freud's lines. I was even considered to be his best disciple. I was on excellent terms with him until I had the idea that certain things are symbolical. Freud would not agree to this, and he identified his method with the theory and the theory with the method. That is impossible, you cannot identify a method with science. I said that in view of these things I could not keep on publishing the *Jahrbuch*[15] and I withdrew.

[275] But I am perfectly well aware of the merits of Freud and I do not want to diminish them. I know that what Freud says agrees with many people, and I assume that these people have exactly the kind of psychology that he describes. Adler, who has entirely different views, also has a large following, and I am convinced that many people have an Adlerian psychology. I too have a following—not so large as Freud's—and it consists presumably of people who have my psychology. I consider my contribution to psychology to be my subjective confession. It is my personal psychology, my prejudice that I see psychological facts as I do. I admit that I see things in such and such a way. But I expect Freud and Adler to do the same and confess that their ideas are their subjective point of view. So far as we admit our personal prejudice, we are really contributing towards an objective psychology. We cannot help being prejudiced by our ancestors, who want to look at things in a certain way, and so we instinctively have certain points of view. It would be neurotic if I saw things in another way than my instinct tells me to do; my snake, as the primitives say, would be all against me. When Freud said certain things, my snake did not agree. And I take the route that my snake prescribes, because that is good for me. But I have patients with whom I have to make a Freudian analysis and go into all the details which Freud has correctly described. I have other cases that force me to an Adlerian point of view, because they have a power complex. People who have the capacity to adapt and are successful are more inclined to have a Freudian

psychology, because a man in that position is looking for the gratification of his desires, while the man who has not been successful has no time to think about desires. He has only one desire—to succeed, and he will have an Adlerian psychology, because a man who always falls into the second place will develop a power complex.

[276] I have no power complex in that sense because I have been fairly successful and in nearly every respect I have been able to adapt. If the whole world disagrees with me it is perfectly indifferent to me. I have a perfectly good place in Switzerland, I enjoy myself, and if nobody enjoys my books I enjoy them. I know nothing better than being in my library, and if I make discoveries in my books, that is wonderful. I cannot say I have a Freudian psychology because I never had such difficulties in relation to desires. As a boy I lived in the country and took things very naturally, and the natural and unnatural things of which Freud speaks were not interesting to me. To talk of an incest complex just bores me to tears. But I know exactly how I could make myself neurotic: if I said or believed something that is not myself. I say what I see, and if somebody agrees with me it pleases me and if nobody agrees it is indifferent to me. I can join neither the Adlerian nor the Freudian confession. I can agree only with the Jungian confession because I see things that way even if there is not a single person on earth who shares my views. The only thing I hope for is to give you some interesting ideas and let you see how I tackle things.

[277] It is always interesting to me to see a craftsman at work. His skill makes the charm of a craft. Psychotherapy is a craft and I deal in my individual way—a very humble way with nothing particular to show—with the things I have to do. Not that I believe for a moment that I am absolutely right. Nobody is absolutely right in psychological matters. Never forget that in psychology the *means* by which you judge and observe the psyche is the *psyche* itself. Have you ever heard of a hammer beating itself? In psychology the observer is the observed. The psyche is not only the *object* but also the *subject* of our science. So you see, it is a vicious circle and we have to be very modest. The best we can expect in psychology is that everybody puts his cards on the table and admits: “I

handle things in such and such a way, and this is how I see them." Then we can compare notes.

[278] I have always compared notes with Freud and Adler. Three books have been written by pupils of mine who tried to give a synopsis of the three points of view.[16] You have never heard this from the other side. That is our Swiss temperament. We are liberal and we try to see things side by side, together. From my point of view the best thing is to say that obviously there are thousands of people who have a Freudian psychology and thousands who have an Adlerian psychology. Some seek gratification of desire and some others fulfilment of power and yet others want to see the world as it is and leave things in peace. We do not want to change anything. The world is good as it is.

[279] There are many different psychologies in existence. A certain American university, year after year, issues a volume of the psychologies of 1934, 1935, and so on. There is a total chaos in psychology, so do not be so frightfully serious about psychological theories. Psychology is not a religious creed but a point of view, and when we are human about it we may be able to understand each other. I admit that some people have sexual trouble and others have other troubles. I have chiefly other troubles. You now have an idea of how I look at things. My problem is to wrestle with the big monster of the historical past, the great snake of the centuries, the burden of the human mind, the problem of Christianity. It would be so much simpler if I knew nothing; but I know too much, through my ancestors and my own education. Other people are not worried by such problems, they do not care about the historical burdens Christianity has heaped upon us. But there are people who are concerned with the great battle between the present and the past or the future. It is a tremendous human problem. Certain people make history and others build a little house in the suburbs. Mussolini's case is not settled by saying he has a power complex. He is concerned with politics, and that is his life and death. The world is huge and there is not one theory only to explain everything.

[280] To Freud the unconscious is chiefly a receptacle for things repressed. He looks at it from the corner of the nursery. To me it is a vast historical storehouse. I acknowledge I have a nursery too, but it is small in

comparison with the vast spaces of history which were more interesting to me from childhood than the nursery. There are many people like myself, I am optimistic in that respect. Once I thought there were no people like myself; I was afraid it was megalomania to think as I did. Then I found many people who fitted in with my point of view, and I was satisfied that I represented perhaps a minority of people whose basic psychological facts are expressed more or less happily by my formulation, and when you get these people under analysis you will find they do not agree with Freud's or Adler's point of view, but with mine. I have been reproached for my naïveté. When I am not sure about a patient I give him books by Freud and Adler and say, "Make your choice," in the hope that we are going on the right track. Sometimes we are on the wrong track. As a rule, people who have reached a certain maturity and who are philosophically minded and fairly successful in the world and not too neurotic, agree with my point of view. But you must not conclude from what I present to you that I always lay my cards on the table and tell the patient all I mention here. Time would not allow me to go into all those details of interpretation. But a few cases need to acquire a great amount of knowledge and are grateful when they see a way to enlarge their point of view.

[281] I cannot say where I could find common ground with Freud when he calls a certain part of the unconscious the Id. Why give it such a funny name? It is the unconscious and that is something we do not know. Why call it the Id? Of course the difference of temperament produces a different outlook. I never could bring myself to be so frightfully interested in these sex cases. They do exist, there are people with a neurotic sex life and you have to talk sex stuff with them until they get sick of it and you get out of that boredom. Naturally, with my temperamental attitude, I hope to goodness we shall get through with the stuff as quickly as possible. It is neurotic stuff and no reasonable normal person talks of it for any length of time. It is not natural to dwell on such matters. Primitives are very reticent about them. They allude to sexual intercourse by a word that is equivalent to "hush." Sexual things are taboo to them, as they really are to us if we are natural. But taboo things and places are always apt to be the receptacle for all sorts of projections.

And so very often the real problem is not to be found there at all. Many people make unnecessary difficulties about sex when their actual troubles are of quite a different nature.

[282] Once a young man came to me with a compulsion neurosis. He brought me a manuscript of his of a hundred and forty pages, giving a complete Freudian analysis of his case. It was quite perfect according to the rules, it could have been published in the *Jahrbuch*. He said: “Will you read this and tell me why I am not cured although I made a complete psychoanalysis?” I said: “So you have, and I do not understand it either. You ought to be cured according to all the rules of the art, but when you say you are not cured I have to believe you.” He repeated: “Why am I not cured, having a complete insight into the structure of my neurosis?” I said: “I cannot criticize your thesis. The whole thing is marvellously well demonstrated. There remains only one, perhaps quite foolish, question: you do not mention where you come from and who your parents are. You say you spent last winter on the Riviera and the summer in St. Moritz. Were you very careful in the choice of your parents?” “Not at all.” “You have an excellent business and are making a good deal of money?” “No, I cannot make money.” “Then you have a big fortune from an uncle?” “No.” “Then where does the money come from?” He replied: “I have a certain arrangement. I have a friend who gives me the money.” I said: “It must be a wonderful friend,” and he replied, “It is a woman.” She was much older than himself, aged thirty-six, a teacher in an elementary school with a small salary, who, as an elderly spinster, fell in love with the fellow who was twenty-eight. She lived on bread and milk so that he could spend his winter on the Riviera and his summer in St. Moritz. I said: “And you ask why you are ill!” He said: “Oh, you have a moralistic point of view; that is not scientific.” I said: “The money in your pocket is the money of the woman you cheat.” He said, “No, we agreed upon it. I had a serious talk with her and it is not a matter for discussion that I get the money from her.” I said: “You are pretending to yourself that it is not her money, but you live by it, and that is immoral. That is the cause of your compulsion neurosis. It is a compensation and a punishment for an immoral attitude.” An utterly unscientific point of view, of course, but it

is my conviction that he deserves his compulsion neurosis and will have it to the last day of his life if he behaves like a pig.

Dr. T. A. Ross:

[283] Did not that come out in the analysis?

Professor Jung:

[284] He went right away like a god and thought: “Dr. Jung is only a moralist, not a scientist. Anybody else would have been impressed by the interesting case instead of looking for simple things.” He commits a crime and steals the savings of a lifetime from an honest woman in order to be able to have a good time. That fellow belongs in gaol, and his compulsion neurosis provides it for him all right.

Dr. P. W. L. Camps:

[285] I am a humble general practitioner, not a psychologist, and may be labelled as a suburban villa. I am an outsider in this place. The first night I thought I had no right to be here; the second night I was here again; the third night I was glad to be here; and the fourth night I am in a maze of mythology.

[286] I would like to ask something about last night. We were sent away with the idea that perfection was most undesirable and completion the end and aim of existence. I slept soundly last night but I felt that I had had an ethical shock. Perhaps I am not gifted with much intellect and it was an intellectual shock too. Professor Jung declares himself a determinist or fatalist. After he had analysed a young man who went away disappointed and then went to bits, Professor Jung felt it was only right that he should go to bits. You as psychologists, I take it, are endeavouring to cure people, and you have a purpose in life, not merely to enjoy your interests, whether it be mythology or the study of human nature. You want to get at the bottom of human nature and try to build it up to something better.

[287] I listened with the greatest interest to Professor Jung's simple English terms and rejoiced in them. I have been confounded with all this new terminology. To hear of our sensation and thinking and feeling and intuition—to which possibly an X may be added for something else—was most illuminating to me as an ordinary individual.

[288] But I feel that we did not hear where the conscious or rather where the unconscious of the child develops. I fear that we did not hear enough about children. I should like to ask Professor Jung where the unconscious in the child does become the conscious.

[289] I should also like to know whether we are not misled some what by this multitude of diagrams, barriers, Egos, and Ids, and other things I have seen portrayed; whether we could not improve on these diagrams by having a gradation of stages.

[290] As Professor Jung has pointed out, we have inherited faces and eyes and ears and there are a multitude of faces and in psychology there are a multitude of types also. Is it not reasonable to suppose that there is an enormous possibility of varieties planted on that inheritance, that they are a sort of mesh, a sieve as it were, that will receive impressions and select them in the unconscious years of early life and reach through into consciousness later? I should like to ask Professor Jung whether these thoughts have crossed the mind of an eminent psychologist such as he is —the very greatest psychologist in my view—tonight?

Professor Jung:

[291] After that severe reproach for immorality I owe an explanation of my cynical remarks of yesterday. I am not as bad as all that. I naturally try to do my best for my patients, but in psychology it is very important that the doctor should not strive to heal at all costs. One has to be exceedingly careful not to impose one's own will and conviction on the patient. We have to give him a certain amount of freedom. You can't wrest people away from their fate, just as in medicine you cannot cure a patient if nature means him to die. Sometimes it is really a question whether you are allowed to rescue a man from the fate he must undergo for the sake of his further development. You cannot save certain people from

committing terrible nonsense because it is in their grain. If I take it away they have no merit. We only gain merit and psychological development by accepting ourselves as we are and by being serious enough to live the lives we are trusted with. Our sins and errors and mistakes are necessary to us, otherwise we are deprived of the most precious incentives to development. When a man goes away, having heard something which might have changed his mind, and does not pay attention, I do not call him back. You may accuse me of being unchristian, but I do not care. I am on the side of nature. The old Chinese Book of Wisdom says: “The Master says it once.” He does not run after people, it is no good. Those who are meant to hear will understand, and those who are not meant to understand will not hear.

[292] I was under the impression that my audience consisted chiefly of psychotherapists. If I had known that medical men were present I would have expressed myself more civilly. But psychotherapists will understand. Freud—to quote the master’s own words—says it is not good to try to cure at all costs. He often repeated that to me, and he is right.

[293] Psychological truths are two-edged, and whatever I say can be used in such a way that it can work the greatest evil, the greatest devastation and nonsense. There is not one statement I have made which has not been twisted into its opposite. So I do not insist on any statement. You can take it, but if you do not take it, all right. You may perhaps blame me for that, but I trust that there is a will to live in everybody which will help them to choose the thing that is right for them. When I am treating a man I must be exceedingly careful not to knock him down with my views or my personality, because he has to fight his lonely fight through life and he must be able to trust in his perhaps very incomplete armour and in his own perhaps very imperfect aim. When I say, “That is not good and should be better,” I deprive him of courage. He must plough his field with a plough that is not good perhaps: mine may be better, but what good is it to him? He has not got my plough. I have it and he cannot borrow it; he must use his own perhaps very incomplete tools and has to work with his own inherited capacities, whatever they are. I help him of course, I may say for instance: “Your thinking is perfectly good, but

perhaps in another respect you could improve.” If he does not want to hear it, I shall not insist because I do not want to make him deviate.

Dr. Marion Mackenzie:

[294] In the same way that the rich young man was not called back but went away sorrowful?

Professor Jung:

[295] Yes, it is the same technique. If I were to say to a man, “You should not go away.” he would never come back. I have to say, “Have your own way.” Then he will trust me.

[296] As to the question about children, there has been in the last decades such a noise about children that I often scratch my head at a meeting and say: “Are they all midwives and nurses?” Does not the world consist chiefly of parents and grandparents? The adults have the problems. Leave the poor children alone. I get the mother by the ears and not the child. The parents make the neuroses of children.

[297] It is certainly interesting to make researches into the development of consciousness. The beginning of consciousness is a fluid condition, and you cannot say when the child has become really conscious and when it has not yet. But that belongs to an entirely different chapter: the psychology of the ages. There is a psychology of childhood, which apparently consists in the psychology of the respective parents; a psychology from infancy to puberty; a psychology of puberty, of the young man, of the adult man of thirty-five, of the man in the second half of life, of the man in old age. That is a science in itself, and I could not possibly bring in all that too. I have a most difficult time as it is to illustrate one single dream. Science is large. It is as if you expected a physicist, when he talks of the theory of light, to elucidate at the same time the whole of mechanical physics. It is simply not possible. Psychology is not an introductory course for nurses; it is a very serious science and consists of a heap of knowledge, so you should not expect too much from me. I am doing my level best to grapple with dreams and

to tell you something about them, and I naturally cannot fulfil all expectations.

[298] As to the question about perfection: to strive for perfection is a high ideal. But I say: “Fulfil something you are able to fulfil rather than run after what you will never achieve.” Nobody is perfect. Remember the saying: “None is good but God alone,”[17] and nobody can be. It is an illusion. We can modestly strive to fulfil ourselves and to be as complete human beings as possible, and that will give us trouble enough.

Dr. Eric B. Strauss:

[299] Does Professor Jung intend to publish the reasons which led him to identify certain archetypal symbols with physiological processes?

Professor Jung:

[300] The case you refer to was submitted to me by Dr. Davie, and afterwards he published it without my knowledge.[18] I do not wish to say more about this correlation because I do not yet feel on very safe ground. Questions of differential diagnosis between organic disease and psychological symbols are very difficult, and I prefer not to say anything about it for the time being.

Dr. Strauss:

[301] But your diagnosis was made from the facts of the dream?

Professor Jung:

[302] Yes, because the organic trouble disturbed the mental functioning. There was a serious depression and presumably a profound disturbance of the sympathetic system.

Dr. H. Crichton-Miller:

[303] Tomorrow is the last seminar, and there is a point that interests us that has not been referred to. That is the difficult problem of transference. I

wonder if Professor Jung would think it proper to give us his view tomorrow—without dealing necessarily with other schools—as to transference and the proper handling of it?

LECTURE V

The Chairman (Dr. J. R. Rees):

[304] Ladies and Gentlemen: You will have noticed that the Chairman’s remarks have been growing shorter each evening. Yesterday Professor Jung was in the middle of a continuous story, and I think we all want him to get on with it straight away.

Professor Jung:

[305] Ladies and Gentlemen: You remember that I began to give you the material belonging to this dream. I am now in the middle of it and there is a great more to come. But at the end of yesterday’s lecture I was asked by Dr. Crichton-Miller to speak about the problem of transference. That showed me something which seems to be of practical interest. When I analyse such a dream carefully and put in a great deal of work, it often happens that my colleagues wonder why I am heaping up such a quantity of learned material. They think, “Well, yes, it shows his zeal and his goodwill to make something of a dream. But what is the practical use of all these parallels?”

[306] I do not mind these doubts in the least. But I was really just about to bring in something belonging to the problem, and Dr. Crichton-Miller has caught me in this attempt and asked just that question which any practical doctor would ask. Practical doctors are troubled by practical problems, and not by theoretical questions; therefore they always get a bit impatient when it comes to theoretical elucidations. They are particularly troubled by the half-amusing, half-painful, even tragic problems of transference. If you had been a little bit more patient, you would have seen that I was handling the very material by which transference can be analysed. But since the question has been raised I think I should rather give way to your wish and talk about the psychology and treatment of transference. But the

choice is up to you. My feeling was that Dr. Crichton-Miller had spoken the mind of the majority of you. Am I right in this assumption?

Members:

[307] Yes.

Professor Jung:

[308] I think you are right in your decision, for if I am going to speak about transference I shall have the opportunity to lead back to what I had originally intended with the analysis of that dream. I am afraid we will not have time to finish it; but I think it is better if I start from your actual problems and your actual difficulties.

[309] I would never have been forced to work out that elaborate symbolism and this careful study of parallels if I had not been terribly worried by the problem of transference. So, in discussing the question of transference, an avenue will open to the kind of work I was trying to describe to you in my lecture last night. I told you in the beginning that my lectures will be a sorry torso. I am simply unable, in five evenings, even if I compress things together as I have done, to give you a complete summary of what I have to tell.

[310] Speaking about the transference makes it necessary first to define the concept so that we really understand what we are talking about. You know that the word transference, originally coined by Freud, has become a sort of colloquial term; it has even found its way into the larger public. One generally means by it an awkward hanging-on, an adhesive sort of relationship.

[311] The term “transference” is the translation of the German word *Übertragung*. Literally *Übertragung* means: to carry something over from one place to another. The word *Übertragung* is also used in a metaphorical sense to designate the carrying over from one form into another. Therefore in German it is synonymous with *Übersetzung*—that is, translation.

[312] The psychological process of transference is a specific form of the more general process of projection. It is important to bring these two

concepts together and to realize that transference is a special case of projection—at least that is how I understand it. Of course, everybody is free to use the term in his own way.

[313] Projection is a general psychological mechanism that carries over subjective contents of any kind into the object. For instance, when I say, “The colour of this room is yellow,” that is a projection, because in the object itself there is no yellow; yellow is only in us. Colour is our subjective experience as you know. The same when I hear a sound, that is a projection, because sound does not exist in itself; it is a sound in my head, it is a psychic phenomenon which I project.

[314] Transference is usually a process that happens between two people and not between a human subject and a physical object, though there are exceptions; whereas the more general mechanism of projection, as we have seen, can just as well extend to physical objects. The mechanism of projection, whereby subjective contents are carried over into the object and appear as if belonging to it, is never a voluntary act, and transference, as a specific form of projection, is no exception to this rule. You cannot consciously and intentionally project, because then you know all the time that you are projecting your subjective contents; therefore you cannot locate them in the object, for you know that they really belong to you. In projection the apparent fact you are confronted with in the object is in reality an illusion; but you assume what you observe in the object not to be subjective, but objectively existing. Therefore, a projection is abolished when you find out that the apparently objective facts are really subjective contents. Then these contents become associated with your own psychology, and you cannot attribute them to the object any more.

[315] Sometimes one is apparently quite aware of one’s projections though one does not know their full extent. And that portion of which one is not aware remains unconscious and still appears as if belonging to the object. This often happens in practical analysis. You say, for instance: “Now, look here, you simply project the image of your father into that man, or into myself,” and you assume that this is a perfectly satisfactory explanation and quite sufficient to dissolve the projection. It is satisfactory to the doctor, perhaps, but not to the patient. Because, if there

is still something more in that projection, the patient will keep on projecting. It does not depend upon his will; it is simply a phenomenon that produces itself. Projection is an automatic, spontaneous fact. It is simply there; you do not know how it happens. You just find it there. And this rule, which holds good for projection in general, is also true of transference. Transference is something which is just there. If it exists at all, it is there *a priori*. Projection is always an *unconscious* mechanism, therefore consciousness, or conscious realization, destroys it.

[316] Transference, strictly, as I have already said, is a projection which happens between two individuals and which, as a rule, is of an emotional and compulsory nature. Emotions in themselves are always in some degree overwhelming for the subject, because they are involuntary conditions which override the intentions of the ego. Moreover, they cling to the subject, and he cannot detach them from himself. Yet this involuntary condition of the subject is at the same time projected into the object, and through that a bond is established which cannot be broken, and exercises a compulsory influence upon the subject.

[317] Emotions are not detachable like ideas or thoughts, because they are identical with certain physical conditions and are thus deeply rooted in the heavy matter of the body. Therefore the emotion of the projected contents always forms a link, a sort of dynamic relationship, between the subject and the object—and that is the transference. Naturally, this emotional link or bridge or elastic string can be positive or negative, as you know.

[318] The projection of emotional contents always has a peculiar influence. Emotions are contagious, because they are deeply rooted in the sympathetic system; hence the word “sympathicus.” Any process of an emotional kind immediately arouses similar processes in others. When you are in a crowd which is moved by an emotion, you cannot fail to be roused by that same emotion. Suppose you are in a country where a language is spoken which you don’t understand, and somebody makes a joke and people laugh, then you laugh too in an idiotic way, simply because you can’t refrain from laughing. Also when you are in a crowd which is politically excited you can’t help being excited too, even when you do not share their opinion at all, because emotion has this suggestive

effect. The French psychologists have dealt with this “contagion mentale”; there are some very good books on the subject, especially *The Crowd: A Study of the Popular Mind*, by Le Bon.

[319] In psychotherapy, even if the doctor is entirely detached from the emotional contents of the patient, the very fact that the patient has emotions has an effect upon him. And it is a great mistake if the doctor thinks he can lift himself out of it. He cannot do more than become conscious of the fact that he is affected. If he does not see that, he is too aloof and then he talks beside the point. It is even his duty to accept the emotions of the patient and to mirror them. That is the reason why I reject the idea of putting the patient upon a sofa and sitting behind him. I put my patients in front of me and I talk to them as one natural human being to another, and I expose myself completely and react with no restriction.

[320] I remember very well a case of an elderly woman of about fifty-eight —a doctor too—from the United States. She arrived in Zurich in a state of utter bewilderment. She was so confused at first I thought her half crazy, until I discovered that she had been in an analysis. She told me certain things she had done in her bewilderment, and it was quite obvious that she would never have done these things if her analyst had been a human being and not a mystical cipher who was sitting behind her, occasionally saying a wise word out of the clouds and never showing an emotion. So she got quite lost in her own mists and did some foolish things which he could easily have prevented her from doing if he had behaved like a human being. When she told me all that, I naturally had an emotional reaction and swore, or something like that. Upon which she shot out of her chair and said reproachfully, “But you have an emotion!” I answered, “Why, of course I have an emotion.” She said, “But you should not have an emotion.” I replied, “Why not? I have a good right to an emotion.” She objected, “But you are an analyst!” I said, “Yes, I am an analyst, and I have emotions. Do you think that I am an idiot or a catatonic?” “But analysts have no emotions.” I remarked, “Well, your analyst apparently had no emotions, and, if I may say so, he was a fool!” That one moment cleared her up completely; she was absolutely different from then on. She said, “Thank heaven! Now I know where I am. I know

there is a human being opposite me who has human emotions!” My emotional reaction had given her orientation. She wasn’t a thinking type, she was a feeling type and therefore needed that kind of orientation. But her analyst was a man who simply thought and existed in his intellect, and had no connection with her feeling-life. She was a highly emotional sanguine sort of person who needed the emotionality and the feeling gesture of another human being in order not to feel alone. When you have to treat a feeling type and you talk intellectual stuff exclusively it is the same as if you, as the only intellectual, were talking to a company of feeling types. You would be utterly lost; you would feel as if you were at the North Pole, because you wouldn’t be understood; nobody would react to your ideas. People would all be frightfully nice—and you would feel utterly foolish because they would not respond to your way of thinking.

[321] One always has to answer people in their main function, otherwise no contact is established. So, in order to be able to show my patients that their reactions have arrived in my system, I have to sit opposite them so that they can read the reactions in my face and can see that I am listening. If I sit behind them, then I can yawn, I can sleep, I can go off on my own thoughts, and I can do what I please. They never know what is happening to me, and then they remain in an auto-erotic and isolated condition which is not good for ordinary people. Of course, if they were going to prepare for an existence as hermits on the Himalayas, it would be a different matter.

[322] The emotions of patients are always slightly contagious, and they are very contagious when the contents which the patient projects into the analyst are identical with the analyst’s own unconscious contents. Then they both fall into the same dark hole of unconsciousness, and get into the condition of participation. This is the phenomenon which Freud has described as countertransference. It consists of mutual projecting into each other and being fastened together by mutual unconsciousness. Participation, as I have told you, is a characteristic of primitive psychology, that is, of a psychological level where there is no conscious discrimination between subject and object. Mutual unconsciousness is of course most confusing both to the analyst and to the patient; all orientation is lost, and the end of such an analysis is disaster.

[323] Even analysts are not absolutely perfect, and it can happen that they are occasionally unconscious in certain respects. Therefore long ago I stipulated that analysts ought to be analysed themselves: they should have a father confessor or a mother confessor. Even the Pope, for all his infallibility, has to confess regularly, and not to a monsignor or a cardinal but to an ordinary priest. If the analyst does not keep in touch with his unconscious objectively, there is no guarantee whatever that the patient will not fall into the unconscious of the analyst. You probably all know certain patients who possess a diabolical cunning in finding out the weak spot, the vulnerable place in the analyst's psyche. To that spot they seek to attach the projections of their own unconscious. One usually says that it is a characteristic of women, but that is not true, men do just the same. They always find out this vulnerable spot in the analyst, and he can be sure that, whenever something gets into him, it will be exactly in that place where he is without defence. That is the place where he is unconscious himself and where he is apt to make exactly the same projections as the patient. Then the condition of participation happens, or, more strictly speaking, a condition of personal contamination through mutual unconsciousness.

[324] One has, of course, all sorts of ideas about transference, and we are all somewhat prejudiced by the definition which Freud has given; one is inclined to think that it is always a matter of erotic transference. But my experience has not confirmed the theory that it is erotic contents or infantile things exclusively that are projected. According to my experience, anything can be a matter for projection, and the erotic transference is just one of the many possible forms of transference. There are many other contents in the human unconscious which are also of a highly emotional nature, and they can project themselves just as well as sexuality. All activated contents of the unconscious have the tendency to appear in projection. It is even the rule that an unconscious content which is constellated shows itself first as a projection. Any activated archetype can appear in projection, either into an external situation, or into people, or into circumstances—in short, into all sorts of objects. There are even transferences to animals and to things.

[325] Not very long ago I had an interesting case of an unusually intelligent man. I explained to him a projection he had “made”: he had projected his unconscious image of woman into a real woman, and the dreams showed very clearly just where the real person was utterly different from what he expected her to be, The fact went home. Then he said, “If I had known that two years ago it would have saved me 40,000 francs!” I asked, “How is that?” “Well, somebody showed me an old Egyptian sculpture, and I instantly fell in love with it. It was an Egyptian cat, a very beautiful thing.” He instantly bought it for 40,000 francs and put it on the mantelpiece in his drawing-room. But then he found that he had lost his peace of mind. His office was on the floor below, and nearly every hour he had to jump up from his work to look at the cat, and when he had satisfied his desire he went back to work only to go upstairs again after some time. This restlessness became so disagreeable that he put the cat on his desk right opposite him—to find that he couldn’t work any more! Then he had to lock it away in the attic in order to be liberated from its influence, and he had to fight down a continuous temptation to open the box and look at the cat again. When he understood his general projection of the feminine image—for, of course, the cat symbolized the woman—then the whole charm and fascination of the sculpture was gone.

[326] That was a projection into a physical object, and it made the cat into a living being to whom he always had to return as some people return to the analyst. As you know, the analyst is often accused of having snake’s eyes, of magnetizing or hypnotizing people, of forcing them to come back to him, of not letting them go. There *are* certain exceptionally bad cases of countertransference when the analyst really cannot let go of the patient; but usually such accusations are the expression of a very disagreeable kind of projection which may even amount to ideas of persecution.

[327] The intensity of the transference relationship is always equivalent to the importance of its contents to the subject. If it is a particularly intense transference, we can be sure that the contents of the projection, once they are extracted and made conscious, will prove to be just as important to the patient as the transference was. When a transference collapses it does not vanish into the air; its intensity, or a corresponding amount of energy,

will appear in another place, for instance in another relationship, or in some other important psychological form. For the intensity of the transference is an intense emotion which is really the property of the patient. If the transference is dissolved, all that projected energy falls back into the subject, and he is then in possession of the treasure which formerly, in the transference, had simply been wasted.

[328] Now we have to say a few words about the *aetiology* of the transference. Transference can be an entirely spontaneous and unprovoked reaction, a sort of "love at first sight." Of course transference should never be misunderstood as love; it has nothing to do with love whatever. Transference only misuses love. It may appear as if transference were love, and inexperienced analysts make the mistake of taking it for love, and the patient makes the same mistake and says that he is in love with the analyst. But he is not in love at all.

[329] Occasionally a transference can even spring up before the first sight, that is before or outside the treatment. And if it happens to a person who does not come for analysis afterwards, we cannot find out the reasons. But this shows all the more that it has nothing whatever to do with the real personality of the analyst.

[330] Once a lady came to me whom I had seen about three weeks before at a social reception. I had not even spoken to her then, I had only talked to her husband, and I knew him only rather superficially. The lady then wrote for a consultation, and I gave her an appointment. She came, and when she was at the door of my consulting room she said, "I don't want to enter." I replied, "You don't have to enter; you can go away, of course! I have absolutely no interest in having you here if you don't want to come." Then she said, "But I must!" I answered, "I'm not forcing you." "But you forced me to come." "How did I do that?" I thought she was crazy, but she was not crazy at all, she merely had a transference which pulled her to me. She had made some kind of projection in the meantime, and that projection had such a high emotional value for her that she could not resist it; she was magically drawn to come to me because that elastic string was too strong for her. In the course of her analysis we naturally found out what the contents of that non-provoked transference were.

[331] Usually a transference establishes itself only during the analysis. Very often it is caused by a difficulty in making contact, in establishing emotional harmony between the doctor and the patient—what the French psychologists at the time of hypnotic and suggestion therapy used to call “le rapport.” A good rapport means that the doctor and patient are getting on well together, that they can really talk to each other and that there is a certain amount of mutual confidence. Of course, at the time of the hypnotic therapists, the whole hypnotic and suggestive effect depended on the existence or non-existence of the rapport. In analytical treatment, if the rapport between analyst and patient is difficult on account of differences of personality, or if there are other psychological distances between them that hinder the therapeutic effect, that lack of contact causes the unconscious of the patient to try to cover the distance by building a compensatory bridge. Since there is no common ground, no possibility of forming any kind of relationship, a passionate feeling or an erotic fantasy attempts to fill the gap.

[332] This often happens to people who habitually resist other human beings—either because of an inferiority complex or because of megalomania, or for other reasons—and who are psychologically very isolated. Then, out of fear of getting lost, their nature causes a violent effort of the emotions to attach themselves to the analyst. They are in despair that perhaps he too will not understand them: so they try to propitiate either the circumstances, or the analyst, or their own unwillingness by a sort of sexual attraction.

[333] All these compensatory phenomena can be turned round and be applied to the analyst as well. Suppose, for instance, that an analyst has to treat a woman who does not particularly interest him, but suddenly he discovers that he has a sexual fantasy about her. Now I don’t wish it on analysts that they should have such fantasies, but if they do they had better realize it, because it is important information from their unconscious that their human contact with the patient is not good, that there is a disturbance of rapport. Therefore the analyst’s unconscious makes up for the lack of a decent human rapport by forcing a fantasy upon him in order to cover the distance and to build a bridge. These fantasies can be visual, they can be a certain feeling or a sensation—a

sexual sensation, for instance. They are invariably a sign that the analyst's attitude to the patient is wrong, that he overvalues him or undervalues him or that he does not pay the right attention. That correction of his attitude can also be expressed by dreams. So if you dream of a patient, always pay attention and try to see whether the dream is showing you where you may be wrong. Patients are tremendously grateful when you are honest in that respect, and they feel it very much when you are dishonest or neglectful.

[334] I once had a most instructive case of that sort. I was treating a young girl of about twenty or twenty-four. She had had a very peculiar childhood; she was born in Java of a very good European family, and had a native nurse.[1] As happens with children born in the colonies, the exotic environment and that strange and, in this case, even barbarous civilization got under her skin, and the whole emotional and instinctual life of the child became tainted with that peculiar atmosphere. That atmosphere is something the white man in the East hardly ever realizes; it is the psychic atmosphere of the native in regard to the white man, an atmosphere of intense fear—fear of the cruelty, the recklessness, and the tremendous and unaccountable power of the white man. That atmosphere infects children born in the East; the fear creeps into them and fills them with unconscious fantasies about the cruelty of the white man, and their psychology gets a peculiar twist and their sex life often goes completely wrong. They suffer from unaccountable nightmares and panics and cannot adapt themselves to normal circumstances when it comes to the problem of love and marriage and so on.

[335] That was the case with this girl. She went hopelessly astray and got into the most risky erotic situations, and she acquired a very bad reputation. She adopted inferior ways; she began to paint and powder herself in a rather conspicuous fashion, also to wear big ornaments in order to satisfy the primitive woman in her blood, or rather in her skin, so that *she* could join in and help her to live. Because she could not and naturally would not live without her instincts, she had to do all sorts of things which went too low. For instance, she easily succumbed to bad taste; she wore terrible colours to please the primitive unconscious in her so that it would join in when she wanted to interest a man. But naturally

her choice of men was also below the mark, and so she got into a frightful tangle. Her nickname was “the great whore of Babylon.” All this was, of course, most unfortunate for an otherwise decent girl. When she came to me she really looked absolutely forbidding, so that I felt pretty awkward on account of my own maids when she was in my office for an hour. I said, “Now, you simply can’t look like that, you look like—” and I said something exceedingly drastic. She was very sad over it but she couldn’t help it.

[336] At this point I dreamed of her in the following way: *I was on a highway at the foot of a high hill, and upon the hill was a castle, and on that castle was a high tower, the donjon. On top of that high tower was a loggia, a beautiful open contrivance with pillars and a beautiful marble balustrade, and upon that balustrade sat an elegant figure of a woman. I looked up—and I had to look up so that I felt the pain in my neck even afterwards—and the figure was my patient!* Then I woke up and instantly I thought, “Heavens! Why does my unconscious put that girl so high up?” And immediately the thought struck me, “I have looked down on her.” For I really thought that she was bad. My dream showed me that this was a mistake, and I knew that I had been a bad doctor. So I told her the next day: “I have had a dream about you where I had to look up to you so that my neck hurt me, and the reason for this compensation is that I have looked down on you.” That worked miracles, I can tell you! No trouble with the transference any more, because I simply got right with her and met her on the right level.

[337] I could tell you quite a number of informative dreams like that about the doctor’s own attitude. And when you really try to be on a level with the patient, not too high nor too low, when you have the right attitude, the right appreciation, then you have much less trouble with the transference. It won’t save you from it entirely, but sure enough you won’t have those bad forms of transference which are mere over-compensations for a lack of rapport.

[338] There is another reason for over-compensation by transference in the case of patients with an utterly auto-erotic attitude; patients who are shut away in auto-erotic insulation and have a thick coat of armour, or a thick wall and moat around them. Yet they have a desperate need for human

contact, and they naturally begin to crave for a human being outside the walls. But they don’t do anything about it. They won’t lift a finger, and neither will they allow anybody to approach them, and from this attitude they get a terrible transference. Such transferences cannot be touched, because the patients are too well defended on all sides. On the contrary, if you try to do something about the transference, they feel it as a sort of aggression, and they defend themselves still more. So you must leave these people to roast in their own fat until they are satisfied and come voluntarily out of their fortress. Of course they will complain like anything about your lack of understanding and so on, but the only thing you can do is to be patient and say, “Well, you are inside, you show nothing, and as long as you don’t show anything I can do nothing either.”

[339] In such a case the transference can come almost to the boiling point, because only a strong flame will cause the person to leave his castle. Of course that means a great outburst; but the outburst must be borne quietly by the doctor, and the patient will later on be very thankful that he has not been taken literally. I remember the case of a colleague of mine—and I can safely tell you of this case because she is dead—an American woman who came to me under very complicated circumstances. In the beginning she was on her high horse You know there are peculiar institutions in America called universities and colleges for women; in our technical language we call them animus incubators, and they turn out annually a large number of fearful persons. Now she was such a bird. She was “very competent,” she had got into a disagreeable transference situation. She was an analyst and had a case of a married man who fell wildly in love with her, apparently. It was not, of course, love, it was transference. He projected into her that she wanted to marry him but would not admit that she was in love with him and so wasted no end of flowers and chocolates and finery over her, and finally he even threatened her with a revolver. So she had to leave at once and come to me.

[340] It soon turned out that she had no idea of a woman’s feeling-life. She was O.K. as a doctor, but whatever touched the sphere of a man was absolutely and utterly strange to her She was even blissfully ignorant of a man’s anatomy, because at the university, where she had studied one only

dissected female bodies. So you can imagine the situation with which I was confronted.

[341] Naturally I saw it coming, and I saw right away why the man had fallen into the trap. She was totally unconscious of herself as a woman; she was just a man’s mind with wings underneath, and the whole woman’s body was non-existent, and her patient was forced by nature to fill the gap. He had to prove to her that a man does exist and that a man has a claim, that she was a woman and that she should respond to him. It was her female non-existence that baited the trap. He was, of course, equally unconscious, because he did not see at all that she did not exist as a woman. You see, he also was such a bird, consisting of only a head with wings underneath. He also was not a man. We often discover with Americans that they are tremendously unconscious of themselves. Sometimes they suddenly grow aware of themselves, and then you get these interesting stories of decent young girls eloping with Chinamen or with Negroes, because in the American that primitive layer, which with us is a bit difficult, with them is decidedly disagreeable, as it is much lower down. It is the same phenomenon as “going black” or “going native” in Africa.

[342] Now these two people both came into this awful transference situation, and one could say they were both entirely crazy, and therefore the woman had to run away. The treatment was, of course, perfectly clear. One had to make her conscious of herself as a woman, and a woman never becomes conscious of herself as long as she cannot accept the fact of her feelings. Therefore her unconscious arranged a marvellous transference to me, which naturally she would not accept, and I did not force it upon her. She was just such a case of complete insulation, and facing her with her transference would merely have forced her into a position of defence which of course would have defeated the whole purpose of the treatment. So I never spoke of it and just let things go, and quietly worked along with the dreams. The dreams, as they always do, were steadily informing us of the progress of her transference. I saw the climax coming and knew that one day a sudden explosion would take place. Of course, it would be a bit disagreeable and of a very emotional nature, as you have perhaps noticed in your own experience, and I

foresaw a highly sentimental situation. Well, you just have to put up with it; you cannot help it. After six months of very quiet and painstaking systematic work she couldn’t hold herself in any longer, and suddenly she almost shouted: “But I love you!” and then she broke down and fell upon her knees and made an awful mess of herself.

[343] You just have to stand such a moment. It is really awful to be thirty-four years old and to discover suddenly that you are human. Then it comes, of course, as a big lump to you and that lump is often indigestible. If I had told her six months before that the moment would come when she would make declarations of love, she would have jumped off to the moon. Hers was a condition of auto-erotic insulation, and the rising flame, the increasing fire of her emotions finally burned through the walls, and naturally it all came out as a sort of organic eruption. She was the better for its happening, and in that moment even the transference situation in America was settled.

[344] You probably think that all this sounds pretty cold-blooded. As a matter of fact, you can only cope decently with such a situation when you do not behave as if you were superior. You have to accompany the process and lower your consciousness and feel along the situation, in order not to differ too much from your patient; otherwise he feels too awkward and will have the most terrible resentment afterwards. So it is quite good to have a reserve of sentiments which you can allow to play on such an occasion. Of course it requires some experience and routine to strike the right note. It is not always quite easy, but one has to bridge over these painful moments so that the reactions of the patient will not be too bad.

[345] I have already mentioned a further reason for the transference, and that is mutual unconsciousness and contamination.[2] The case which I just told you about provides an example of this. Contamination through mutual unconsciousness happens as a rule when the analyst has a similar lack of adaptation to that of the patient; in other words, when he is neurotic. In so far as the analyst is neurotic, whether his neurosis be good or bad, he has an open wound, somewhere there is an open door which he does not control, and there a patient will get in, and then the analyst will

be contaminated. Therefore it is an important postulate that the analyst should know as much as possible about himself.

[346] I remember the case of a young girl who had been with two analysts before she came to me, and when she came to me she had the identical dream she had had when she was with those analysts.[3] Each time at the very beginning of her analysis she had a particular dream: *She came to the frontier and she wanted to cross it, but she could not find the custom-house where she should have gone to declare whatever she carried with her*. In the first dream she was seeking the frontier, but she did not even come to it. That dream gave her the feeling that she would never be able to find the proper relation to her analyst; but because she had feelings of inferiority and did not trust her judgment, she remained with him, and nothing came of it at all. She worked with him for two months and then she left.

[347] She then went to another analyst. Again she dreamed that *she came to the frontier; it was a black night, and the only thing she could see was a faint little light. Somebody said that that was the light in the custom-house, and she tried to get to it. On the way she went down a hill and crossed a valley. In the depths of the valley was a dark wood and she was afraid to go on, but nevertheless she went through it, and suddenly she felt that somebody was clinging to her in the darkness. She tried to shake herself free, but that somebody clung to her still more, and she suddenly discovered that it was her analyst*. Now what happened was that after about three months of work this analyst developed a violent counter-transference to her, which the initial dream had foreseen.

[348] When she came to me—she had seen me before at a lecture and had made up her mind to work with me—she dreamed that *she was coming to the Swiss frontier. It was day and she saw the custom-house. She crossed the frontier and she went into the custom-house, and there stood a Swiss customs official. A woman went in front of her and he let that woman pass, and then her turn came. She had only a small bag with her, and she thought she would pass unnoticed. But the official looked at her and said: "What have you got in your bag?" She said: "Oh, nothing at all," and opened it. He put his hand in and pulled out something that grew bigger and bigger, until it was two complete beds*. Her problem was that she had

a resistance against marriage; she was engaged and would not marry for certain reasons, and those beds were the marriage-beds. I pulled that complex out of her and made her realize the problem, and soon after she married.

[349] These initial dreams are often most instructive. Therefore I always ask a new patient when he first comes to me: “Did you know some time ago that you were coming? Have you met me before? Have you had a dream lately, perhaps last night?”—because if he did, it gives me most valuable information about his attitude. And when you keep in close touch with the unconscious you can turn many a difficult corner. A transference is always a hindrance; it is never an advantage. You cure in spite of the transference, not because of it.

[350] Another reason for the transference, particularly for bad forms of it, is provocation on the part of the analyst. There are certain analysts, I am sorry to say, who work for a transference because they believe, I don’t know why, that transference is a useful and even necessary part of the treatment; therefore patients *ought* to have a transference. Of course this is an entirely mistaken idea. I have often had cases who came to me after a previous analysis and who after a fortnight or so became almost desperate. So far things had gone on very nicely and I was fully confident that the case would work out beautifully—and suddenly the patients informed me that they could not go on, and then the tears came. I asked, “Why can’t you go on? Have you got no money, or what is the matter?” They said, “Oh, no, that is not the reason. I have no transference.” I said, “Thank heaven you have no transference! A transference is an illness. It is abnormal to have a transference. Normal people never have transferences.” Then the analysis goes on again quietly and nicely.

[351] We do not need transference just as we do not need projection. Of course, people will have it nevertheless. They always have projections but not the kind they expect. They have read Freud on transference, or they have been with another analyst, and it has been pumped into them that they ought to have a transference or they will never be cured. This is perfect nonsense. Transference or no transference, that has nothing to do with the cure. It is simply due to a peculiar psychological condition that there are these projections, and, just as one dissolves other projections by

making them conscious, one has to dissolve the transference by making it conscious too. If there is no transference, so much the better. You get the material just the same. It is not transference that enables the patient to bring out his material; you get all the material you could wish for from dreams. The dreams bring out everything that is necessary. If you work for a transference, most likely you will provoke one, and the result of the analysis will be bad; for you can only provoke a transference by insinuating the wrong things, by arousing expectations, by making promises in a veiled way, which you do not mean to keep because you could not. You cannot possibly have affairs with eleven thousand virgins, and so you cheat people. An analyst is not allowed to be too friendly, otherwise he will be caught by it: he will produce an effect which goes beyond him. He cannot pay the bill when it is presented, and he should not provoke something for which he is not willing to pay. Even if the analyst means to do it for the good of the patient, it is a very misguided way, and it is always a great mistake. Leave people where they are. It does not matter whether they love the analyst or not. We are not all Germans who want to be loved when they sell you a pair of sock-suspenders. It is too sentimental. The patient's main problem is precisely to learn how to live his own life, and you don't help him when you meddle with it.

[352] Those are some of the reasons for a transference. The general psychological reason for projection is always an activated unconscious that seeks expression. The intensity of the transference is equivalent to the importance of the projected content. A strong transference of a violent nature corresponds to a fiery content; it contains something important, something of great value to the patient. But as long as it is projected, the analyst seems to embody this most precious and important thing. He can't help being in this unfortunate position, but he has to give that value back to the patient, and the analysis is not finished until the patient has integrated the treasure. So, if a patient projects the saviour complex into you, for instance, you have to give back to him nothing less than a saviour—whatever that means. But *you* are not the saviour—most certainly not.

[353] Projections of an archetypal nature involve a particular difficulty for the analyst. Each profession carries its respective difficulties, and the danger of analysis is that of becoming infected by transference projections, in particular by archetypal contents. When the patient assumes that his analyst is the fulfilment of his dreams, that he is not an ordinary doctor but a spiritual hero and a sort of saviour, of course the analyst will say, “What nonsense! This is just morbid. It is a hysterical exaggeration.” Yet—it tickles him; it is just too nice. And, moreover, he has the same archetypes in himself. So he begins to feel, “If there are saviours, well, perhaps it is just possible that I am one,” and he will fall for it, at first hesitantly, and then it will become more and more plain to him that he really is a sort of extraordinary individual. Slowly he becomes fascinated and exclusive. He is terribly touchy, susceptible, and perhaps makes himself a nuisance in medical societies. He cannot talk with his colleagues any more because he is—I don’t know what. He becomes very disagreeable or withdraws from human contacts, isolates himself, and then it becomes more and more clear to him that he is a very important chap really and of great spiritual significance, probably an equal of the Mahatmas on the Himalayas, and it is quite likely that he also belongs to the great brotherhood. And then he is lost to the profession.

[354] We have very unfortunate examples of this kind. I know quite a number of colleagues who have gone that way. They could not resist the continuous onslaught of the patients’ collective unconscious—case after case projecting the saviour complex and religious expectations and the hope that perhaps this analyst with his “secret knowledge” might own the key that has been lost by the Church, and thus could reveal the redeeming truth. All this is a subtle and very alluring temptation and they have given way to it. They identify with the archetype, they discover a creed of their own, and as they need disciples who believe in them they will found a sect.

[355] The same problem also accounts for the peculiar difficulty psychologists of different schools have in discussing their divergent ideas in a reasonably amicable way, and for a tendency, peculiar to our branch of science, to lock themselves into little groups and scientific sects with a

faith of their own. All these groups really doubt their exclusive truth, and therefore they all sit together and say the same thing continually until they finally believe it. Fanaticism is always a sign of repressed doubt. You can study that in the history of the Church. Always in those times when the Church begins to waver the style becomes fanatical, or fanatical sects spring up, because the secret doubt has to be quenched. When one is really convinced, one is perfectly calm and can discuss one's belief as a personal point of view without any particular resentment.

[356] It is a typical occupational hazard of the psychotherapist to become psychically infected and poisoned by the projections to which he is exposed. He has to be continually on his guard against inflation. But the poison does not only affect him psychologically; it may even disturb his sympathetic system. I have observed quite a number of the most extraordinary cases of physical illness among psychotherapists, illness which does not fit in with the known medical symptomatology, and which I ascribe to the effect of this continuous onslaught of projections from which the analyst does not discriminate his own psychology. The peculiar emotional condition of the patient does have a contagious effect. One could almost say it arouses similar vibrations in the nervous system of the analyst, and therefore, like alienists, psychotherapists are apt to become a little queer. One should bear that problem in mind. It very definitely belongs to the problem of transference.

[357] We now have to speak of the *therapy* of the transference.[4] This is an enormously difficult and complicated subject, and I am afraid I shall tell you certain things which you know just as well as I do, but in order to be systematic I cannot omit them.

[358] It is obvious that the transference has to be dissolved and dealt with in the same way as the analyst would deal with any other projection. That means in practical terms: you have to make the patient realize the *subjective value* of the personal and impersonal contents of his transference. For it is not only personal material which he projects. As you have just heard, the contents can just as well be of an impersonal, that is archetypal, nature. The saviour complex is certainly not a personal motif; it is a world-wide expectation, an idea which you find all over the

world and in every epoch of history. It is the archetypal ideas of the magic personality.[5]

[359] In the beginning of an analysis, transference projections are inevitable repetitions of former personal experiences of the patient's. At this stage you have to treat all the relationships which the patient has had before. For instance, if you have a case who has been in many health-resorts with the typical doctors you find in such places, the patient will project these experiences into the analyst; so you have first to work through the figures of all those colleagues in seaside places and sanatoria, with enormous fees and the necessary theatrical display, and the patient quite naturally assumes that you too are such a bird. You have to work through the whole series of people that the patient has experienced—the doctors, the lawyers, the teachers in schools, the uncles, the cousins, the brothers, and the father. And when you have gone through the whole procession and come right down to the nursery you think that now you are through with it, but you are not. It is just as if behind the father there was still more, and you even begin to suspect that the grandfather is being projected. That is possible; I never knew of a great-grandfather that was projected into me, but I know of a grandfather that was. When you have got down to the nursery, so that you almost peep out of the other side of existence, then you have exhausted the possibilities of *consciousness;* and if the transference does not come to an end there, despite all your efforts, it is on account of the projection of *impersonal* contents. You recognize the existence of impersonal projections by the peculiar impersonal nature of their contents; as for instance the saviour complex or an archaic God-image. The archetypal character of these images produces a "magic," that is, an overpowering effect. With our rational consciousness we can't see why this should happen. God, for instance, is spirit, and spirit to us is nothing substantial or dynamic. But if you study the original meaning of these terms, you get at the real nature of the underlying experience, and you understand how they affect the primitive mind, and, in a similar way, the primitive psyche in ourselves. Spirit, *spiritus*, or *pneuma* really means air, wind, breath; *spiritus* and *pneuma* in their archetypal character are dynamic and half-substantial

agencies: you are moved by them as by a wind, they are breathed into you, and then you are inflated.

[360] The projected archetypal figures can just as well be of negative character, like images of the sorcerer, the devil, of demons and so on. Even analysts are not at all quite fireproof in that respect. I know colleagues who produce the most marvellous fantasies about myself and believe that I am in league with the devil and work black magic. And with people who never before thought that there was such a thing as the devil, the most incredible figures appear in the transference of impersonal contents. The projection of images of parental influence can be dissolved with the ordinary means of normal reasoning and common sense; but you cannot destroy the hold of impersonal images by mere reason. It would not even be right to destroy them, because they are tremendously important. In order to explain this, I am afraid I shall have to refer again to the history of the human mind.

[361] It is no new discovery that archetypal images are projected. They actually have to be projected, otherwise they inundate consciousness. The problem is merely to have a form which is an adequate container. There is, as a matter of fact, an age-old institution which helps people to project impersonal images. You know it very well: you all probably have gone through the procedure, but unfortunately you were too young to recognize its importance. This institution is religious initiation, and with us it is baptism. When the fascinating and unique influence of the parental images has to be loosened, so that the child is liberated from his original biological participation with the parents, then Nature, that is the unconscious nature in man, in her infinite wisdom produces a certain kind of initiation. You find it with very primitive tribes—it is the initiation into manhood, into participation in the spiritual and social life of the tribe. In the course of the differentiation of consciousness, initiation has undergone many changes of form, until with us it was elaborated into the Christian institution of baptism. In baptism, there are two necessary functionaries, godfather and godmother. In our Swiss dialect we call them by the names of God, “Götti” and “Gotte.” “Götti” is the masculine form, it means the begetter; “Gotte” is the feminine form. The word “God” has nothing to do with “good”; it really means the

Begetter. Baptism and the spiritual parents in the form of godfather and godmother express the mysterium of being twice-born. You know that all the higher castes in India have the honorific title of “Twice-born.” It was also the prerogative of the Pharaoh to be twice-born. Therefore very often you find in Egyptian temples beside the main room the so-called birth-chamber where one or two rooms were reserved for the rite. In them the Pharaoh’s twofold birth is described, how he is born in the flesh as a human being from ordinary parents, but is also generated by the god and carried and given birth to by the goddess. He is born the son of man and of God.

[362] Our baptism means the detaching of the child from the merely natural parents and from the overpowering influence of the parental images. For this purpose, the biological parents are replaced by spiritual parents; godfather and godmother represent the *intercessio divina* through the medium of the Church, which is the visible form of the spiritual kingdom. In the Catholic rite even marriage—where we would suppose it to be all-important that this particular man and this particular woman become united and are confronted with each other—is interfered with by the Church; the *intercessio sacerdotis* prevents the immediate contact of the couple. The priest represents the Church, and the Church is always in between in the form of confession, which is obligatory. This intervention is not due to the particular cunning of the Church; it is rather her great wisdom, and it is an idea going back to the very origins of Christianity that we are not married merely as man and woman; we are married *in Christo*. I own an antique vase upon which an early Christian marriage is represented. The man and the woman hold each other’s hand in the Fish; the Fish is between them, and the Fish is Christ. In this way the couple is united in the Fish. They are separated and united by Christ; Christ is in between, he is the representative of the power which is meant to separate man from merely natural forces.

[363] This process of separation from nature is undergone in the well-known initiation rites or puberty rites of primitive tribes. When they approach puberty, the boys are called away suddenly. In the night they hear the voice of the spirits, the bull-roarers, and no woman is allowed to appear out of the house, or she is killed instantly. Then the boys are

brought out to the bush-house, where they are put through all sorts of gruesome performances. They are not allowed to speak; they are told that they are dead, and then they are told that they are now reborn. They are given new names in order to prove that they are no more the same personalities as before, and so they are no longer the children of their parents. The initiation can even go so far that, after they return, the mothers are not allowed to talk to their sons any more, because the young men are no longer their children. Formerly, with the Hottentots, the boy had occasionally even to perform incest once with his mother in order to prove that she was not his mother any more, but just a woman like the rest.

[364] Our corresponding Christian rite has lost much of its importance, but if you study the symbolism of baptism you still see traces of the original meaning. Our birth-chamber is the baptismal font; this is really the piscina, the fish-pond in which one is like a little fish; one is symbolically drowned and then revived. You know that the early Christians were actually plunged into the baptismal font, and this used to be much larger than it is now; in many old churches the baptistry was a building on its own, and it was always built on the ground-plan of a circle. On the day before Easter, the Catholic Church has a special ceremony for the consecration of the baptismal font, the Benedictio Fontis. The merely natural water is exorcised from the admixture of all malign powers and transformed into the regenerating and purifying fountain of life, the immaculate womb of the divine source. Then the priest divides the water in the fourfold form of the cross, breathes upon it three times, plunges the consecrated Easter candle three times into it, as a symbol of the eternal light, and at the same time his incantation brings the virtue, the power of the Spiritus Sanctus to descend into the font. From this *hierosgamos*, from the holy marriage between the Spiritus Sanctus and the baptismal water as the womb of the Church, man is reborn in the true innocence of new childhood. The maculation of sin is taken from him and his nature is joined with the image of God. He is no longer contaminated by merely natural forces, he is regenerated as a spiritual being.

[365] We know of other institutions for detaching man from natural conditions. I can't go into much detail, but if you study the psychology of primitives, you find that all important events of life are connected with elaborate ceremonies whose purpose is to detach man from the preceding stage of existence and to help him to transfer his psychic energy into the next phase. When a girl marries, she ought to be detached from the parental images and should not become attached to a projection of the father-image into the husband. Therefore in Babylon a peculiar ritual was observed whose purpose was to detach the young girl from the father-image. This is the rite of temple prostitution, in which girls of good families had to hand themselves over to a stranger visiting the temple, who presumably would never return, and had to spend a night with him. We know of a similar institution in the Middle Ages, the *jus primae noctis*, the right of the first night which the feudal lord had in regard to his serfs. The bride had to spend her wedding-night with her feudal lord. By the rite of temple prostitution, a most impressive image was created which collided with the image of the man the young woman was going to marry, and so when there was trouble in marriage—for even in those days trouble occasionally arose—the regression which is the natural result would not go back to the father-image but to the stranger she had once met, the lover who came from unknown lands. Then she did not fall back into childhood but upon a human being suited to her age, and so was sufficiently protected against infantile regression.

[366] This ritual shows a very beautiful observation of the human psyche. For there is an archetypal image in women of a lover in a remote, unknown land, a man coming over the seas who meets her once and then goes away again. You know this motif from Wagner's *Flying Dutchman* and from Ibsen's *Lady from the Sea*. In both dramas the heroine is waiting for the stranger who will come from far over the seas to have the great love experience with her. In Wagner's opera she has fallen in love with the actual image of him and knows him even before he arrives. The Lady from the Sea has met him once before and is under the compulsion of always going to the sea to await his return. In that Babylonian rite this archetypal image is lived concretely in order to detach the woman from the parental images which are real archetypal images and therefore

exceedingly powerful. I have written a little book about the relations between the ego and the unconscious,[6] where I have described a case of projection of the father-image by a woman who was under my treatment, and how the problem then developed through the analysis of the archetypal image which was at the basis of this father transference.

[367] The first stage of the treatment of the transference does not involve only the realization by the patient that he is still looking at the world from the angle of the nursery, school-room, and so on, by projecting and expecting all the positive and negative authoritative figures of his personal experience; this realization merely deals with the objective side. To establish a really mature attitude, he has to see the *subjective value* of all these images which seem to create trouble for him. He has to assimilate them into his own psychology; he has to find out in what way they are part of himself; how he attributes for instance a positive value to an *object*, when as a matter of fact it is he who could and should develop this value. And in the same way, when he projects negative qualities and therefore hates and loathes the object, he has to discover that he is projecting his own inferior side, his shadow, as it were, because he prefers to have an optimistic and one-sided image of himself. Freud, as you know, deals only with the objective side. But you cannot really help a patient to assimilate the contents of his neurosis by indulgence in a childish lack of responsibility, or by resignation to a blind fate of which he is the victim. His neurosis means him to become a total personality, and that includes recognition of and responsibility for his whole being, his good and his bad sides, his superior as well as his inferior functions.

[368] Let us now assume that the projection of personal images has been worked through and is sufficiently dealt with, but there is still a transference which you simply cannot dissolve. Then we come to the *second stage* in the therapy of transference. That is the *discrimination between personal and impersonal contents*. The personal projections, as we have seen, must be dissolved; and they can be dissolved through conscious realization. But the impersonal projections cannot be destroyed because they belong to the structural elements of the psyche. They are not relics of a past which has to be outgrown; they are, on the contrary, purposive and compensatory functions of the utmost importance. They

are an important protection against situations in which a man might lose his head. In any situation of panic, whether external or internal, the archetypes intervene and allow a man to react in an instinctively adapted way, just as if he had always known the situation: he reacts in the way mankind has always reacted. Therefore the mechanism is of vital importance.

[369] It goes without saying that the projection of these impersonal images upon the analyst has to be withdrawn. But you merely dissolve the *act* of projection; you should not, and really cannot, dissolve its *contents*. Neither, of course, can the patient assimilate the impersonal contents into his personal psychology. The fact that they are *impersonal* contents is just the reason for projecting them; one feels that they do not belong to one's subjective mind, they must be located somewhere outside one's ego, and, for lack of a suitable form, a human object is made their receptacle. So you have to be exceedingly careful in handling impersonal projections. It would, for instance, be a great mistake to say to a patient: "You see, you simply project the saviour-image into me. What nonsense to expect a saviour and to make me responsible." If you meet such an expectation, take it seriously; it is by no means nonsense. The whole world has a saviour expectation; you find it everywhere. Look at Italy, for instance, or look at Germany. At present you have no saviour in England, and in Switzerland we have none; but I don't believe that we are so very different from the rest of Europe. The situation with us is slightly different from that of the Italians and Germans; they are perhaps a little bit less balanced; but even with us it would need precious little. In those countries you have the saviour complex as mass psychology. The saviour complex is an archetypal image of the collective unconscious, and it quite naturally becomes activated in an epoch so full of trouble and disorientation as ours. In these collective events, we merely see, as through a magnifying glass, what can also happen within the individual. It is in just such a moment of panic that the compensatory psychic elements come into action. It is not at all an abnormal phenomenon. It is perhaps strange to us that it should be expressed in political form. But the collective unconscious is a very irrational factor, and our rational consciousness cannot dictate to it how it should make its appearance. Of

course, if left entirely to itself, its activation can be very destructive; it can, for instance, be a psychosis. Therefore, man's relation to the collective unconscious has always been regulated; there is a characteristic form by which the archetypal images are expressed. For the collective unconscious is a function that always operates, and man has to keep in touch with it. His psychic and spiritual health is dependent on the co-operation of the impersonal images. Therefore man has always had his religions.

[370] What are religions? Religions are psychotherapeutic systems. What are we doing, we psychotherapists? We are trying to heal the suffering of the human mind, of the human psyche or the human soul, and religions deal with the same problem. Therefore our Lord himself is a healer; he is a doctor; he heals the sick and he deals with the troubles of the soul; and that is exactly what we call psychotherapy. It is not a play on words when I call religion a psychotherapeutic system. It is the most elaborate system, and there is a great practical truth behind it. I have a clientele which is pretty large and extends over a number of continents, and where I live we are practically surrounded by Catholics; but during the last thirty years I have not had more than about six practising Catholics among my patients. The vast majority were Protestants and Jews. I once sent round a questionnaire to people whom I did not know, asking: "If you were in psychological trouble what would you do? Would you go to the doctor or would you go to the priest or parson?" I cannot remember the actual figures; but I remember that about twenty per cent of the Protestants said they would go to the parson. All the rest were most emphatically against the parson and for the doctor, and the most emphatic were the relatives and children of parsons. There was one Chinese who replied, and he put it very nicely. He remarked: "When I am young I go to the doctor, and when I am old I go to the philosopher." But about fifty-eight or sixty per cent of the Catholics answered that they would certainly go to the priest. That proves that the Catholic Church in particular, with its rigorous system of confession and its director of conscience, is a therapeutic institution. I have had some patients who, after having had analysis with me, even joined the Catholic Church, just as I have had some patients who now go to the so-called Oxford Group Movement—with my

blessing! I think it is perfectly correct to make use of these psychotherapeutic institutions which history has given to us, and I wish I were still a medieval man who could join such a creed. Unfortunately it needs a somewhat medieval psychology to do it, and I am not sufficiently medieval. But you see from this that I take the archetypal images and a suitable form for their projection seriously, because the collective unconscious is really a serious factor in the human psyche.

[371] All those personal things like incestuous tendencies and other childish tunes are mere surface; what the unconscious really contains are the great collective events of the time. In the collective unconscious of the individual, history prepares itself; and when the archetypes are activated in a number of individuals and come to the surface, we are in the midst of history, as we are at present. The archetypal image which the moment requires gets into life, and everybody is seized by it. That is what we see today. I saw it coming, I said in 1918 that the "blond beast" is stirring in its sleep and that something will happen in Germany.[7] No psychologist then understood at all what I meant, because people had simply no idea that our personal psychology is just a thin skin, a ripple upon the ocean of collective psychology. The powerful factor, the factor which changes our whole life, which changes the surface of our known world, which makes history, is collective psychology, and collective psychology moves according to laws entirely different from those of our consciousness. The archetypes are the great decisive forces, they bring about the real events, and not our personal reasoning and practical intellect. Before the Great War all intelligent people said: "We shall not have any more war, we are far too reasonable to let it happen, and our commerce and finance are so interlaced internationally that war is absolutely out of the question." And then we produced the most gorgeous war ever seen. And now they begin to talk that foolish kind of talk about reason and peace plans and such things; they blindfold themselves by clinging to a childish optimism—and now look at reality! Sure enough, the archetypal images decide the fate of man. Man's unconscious psychology decides, and not what we think and talk in the brain-chamber up in the attic.

[372] Who would have thought in 1900 that it would be possible thirty years later for such things to happen in Germany as are happening today? Would you have believed that a whole nation of highly intelligent and cultivated people could be seized by the fascinating power of an archetype? I saw it coming, and I can understand it because I know the power of the collective unconscious. But on the surface it looks simply incredible. Even my personal friends are under that fascination, and when I am in Germany, I believe it myself, I understand it all, I know it has to be as it is. One cannot resist it. It gets you below the belt and not in your mind, your brain just counts for nothing, your sympathetic system is gripped. It is a power that fascinates people from within, it is the collective unconscious which is activated, it is an archetype which is common to them all that has come to life. And because it is an archetype, it has historical aspects and we cannot understand the events without knowing history.[8] It is German history that is being lived today, just as Fascism is living Italian history. We cannot be children about it, having intellectual and reasonable ideas and saying: this should not be. That is just childish. This is real history, this is what really happens to man and has always happened, and it is far more important than our personal little woes and our personal convictions. I know highly educated Germans who were just as reasonable as I think I am or as you think you are. But a wave went over them and just washed their reason away, and when you talk to them you have to admit that they could not do anything about it. An incomprehensible fate has seized them, and you cannot say it is right, or it is wrong. It has nothing to do with rational judgment, it is just history. And when your patient’s transference touches upon the archetypes, you touch upon a mine that may explode, just as we see it explode collectively. These impersonal images contain enormous dynamic power. Bernard Shaw says in *Man and Superman:* “This creature Man, who in his own selfish affairs is a coward to the backbone, will fight for an idea like a hero.”[9] Of course, we would not call Fascism or Hitlerism ideas. They are archetypes, and so we would say: Give an archetype to the people and the whole crowd moves like one man, there is no resisting it.

[373] On account of this tremendous dynamic power of archetypal images you cannot reason them away. Therefore the only thing to do at the *third stage* of the therapy of the transference is *to differentiate the personal relationship to the analyst from impersonal factors*. It is perfectly understandable that when you have carefully and honestly worked for a patient, he likes you, and because you have done a decent bit of work on a patient, you like him, whether it is a man or a woman. That is quite self-evident. It would be most unnatural and neurotic if there were not some personal recognition on the patient's part for what you have done for him. A personal human reaction to you is normal and reasonable, therefore let it be, it deserves to live; it is not transference any more. But such an attitude to the analyst is possible in a human and decent form only when it is not vitiated by unrecognized impersonal values. This means that there has to be, on the other side, a full recognition of the importance of the archetypal images, many of which have a religious character. Whether you assume that the Nazi storm in Germany has a religious value or not does not matter. It has. Whether you think that the Duce is a religious figure or not does not matter, because he is a religious figure. You could even read the affirmation of it in a newspaper these days, when they quoted that verse about a Roman Caesar: "Ecce deus, deus ille, Menalca."[10] Fascism is the Latin form of religion, and its religious character explains why the whole thing has such a tremendous fascination.

[374] The consequence of this recognition of the importance of impersonal values may be that your patient joins a Church or a religious creed or whatever it may be. If he cannot bring together his experience of the collective unconscious within a given religious form, then the difficulty begins. Then the impersonal factors have no receptacle, and so the patient falls back into the transference, and the archetypal images spoil the human relation to the analyst. Then the analyst *is* the saviour, or curse him, he is not when he ought to be! For he is only a human being; he cannot be the saviour nor any other archetypal image which is activated in the patient's unconscious.

[375] On account of that enormously difficult and important problem I have worked out a particular technique for restoring these projected

impersonal values to the individual himself. It is a rather complicated technique, and last night I was just about to show you something of it in relation to that dream. For when the unconscious says that below the Christian Church is the secret chamber with the golden bowl and the golden dagger, it does not lie. The unconscious is nature, and nature never lies. There *is* gold, there *is* the treasure and the great value.

[376] If I had had the opportunity I would have gone on and told you something about that treasure and the means to secure it. And then you would have seen the justification for the method which enables the individual to keep in touch with his impersonal images. As it is. I can only allude to it and must refer you to my books for further material.[11]

[377] I call this *fourth stage* of the therapy of transference the *objectivation of impersonal images*. It is an essential part of the process of individuation.[12] Its goal is to detach consciousness from the object so that the individual no longer places the guarantee of his happiness, or of his life even, in factors outside himself, whether they be persons, ideas, or circumstances, but comes to realize that everything depends on whether he holds the treasure or not. If the possession of that gold is realized, then the centre of gravity is in the individual and no longer in an object on which he depends. To reach such a condition of detachment is the aim of Eastern practices, and it is also the aim of all the teachings of the Church. In the various religions the treasure is projected into the sacred figures, but this hypostasis is no longer possible for the modern enlightened mind. A great number of individuals cannot express their impersonal values in historical symbols any more.

[378] They are therefore faced with the necessity of finding an individual method by which the impersonal images are given shape. For they have to take on form, they have to live their characteristic life, otherwise the individual is severed from the basic function of the psyche, and then he is neurotic, he is disorientated and in conflict with himself. But if he is able to objectify the impersonal images and relate to them, he is in touch with that vital psychological function which from the dawn of consciousness has been taken care of by religion.

[379] It is impossible for me to go into details of the problem, not only because the time for my lecture is over, but because it is beyond scientific

conceptions to give adequate expression to a living psychic experience. All we can say rationally about this condition of detachment is to define it as a sort of centre within the psyche of the individual, but not within the ego. It is a non-ego centre. I am afraid I should have to give you a long dissertation on comparative religion in order to convey to you fully what I mean by a non-ego centre.[13] So I can only mention the existence of this problem. It is really the essential problem of a great number of individuals who come to analysis, and therefore the psychotherapist has to try to find a method by which he can help them to solve it.

[380] If we adopt such a method, we take up the torch that was abandoned by our old colleagues of the seventeenth century when they put it down in order to become chemists. In so far as we psychologists are emerging from chemical and material conceptions of the psyche, we are taking up that torch again, contury—for alchemy was the work of the doctors who were busy with the mind.

Discussion

Question:

[381] May I ask Professor Jung a very elementary question: Would he give us a definition of neurosis?

Professor Jung:

[382] A neurosis is a dissociation of personality due to the existence of complexes. To have complexes is in itself normal; but if the complexes are incompatible, that part of the personality which is too contrary to the conscious part becomes split off. If the split reaches the organic structure, the dissociation is a psychosis, a schizophrenic condition, as the term denotes. Each complex then lives an existence of its own, with no personality left to tie them together.

[383] As the split-off complexes are unconscious, they find only an indirect means of expression, that is, through neurotic symptoms. Instead of suffering from a psychological conflict, one suffers from a neurosis. Any incompatibility of character can cause dissociation, and too great a split between the thinking and the feeling function, for instance, is already a slight neurosis. When you are not quite at one with yourself in a given matter, you are approaching a neurotic condition. The idea of psychic dissociation is the most general and cautious way I can define a neurosis. Of course it does not cover the symptomatology and phenomenology of neurosis; it is only the most general psychological formulation I am able to give.

Dr. H. G. Baynes:

[384] You said that transference is of no practical value in analysis. Is it not possible to give it a teleological value?

Professor Jung:

[385] I have not said it in so many words, but the teleological value of transference becomes apparent from an analysis of its archetypal contents. Its purposive value is also shown in what I said about transference as a function of compensation for a lack of rapport between the analyst and the patient—at least if one assumes that it is normal for human beings to be *en rapport* with each other. Of course I could imagine that an introverted philosopher is rather inclined to think that people have no contacts. For instance, Schopenhauer says that human egotism is so great that a man can kill his brother in order to smear his boots with his brother’s fat.

Dr. Henry V. Dicks:

[386] I think we can assume then, Professor Jung, that you regard the outbreak of a neurosis as an attempt at self-cure, as an attempt at compensation by bringing out the inferior function?

Professor Jung:

[387] Absolutely.

Dr. Dicks:

[388] I understand, then, that the outbreak of a neurotic illness, from the point of view of man’s development, is something favourable?

Professor Jung:

[389] That is so, and I am glad you bring up that idea. That is really my point of view. I am not altogether pessimistic about neurosis. In many cases we have to say: “Thank heaven he could make up his mind to be neurotic.” Neurosis is really an attempt at self-cure, just as any physical disease is part an attempt at selfcure. We cannot understand a disease as an *ens per se* any more, as something detached which not so long ago it was believed to be. Modern medicine—internal medicine, for instance—conceives of disease as a system composed of a harmful factor and a healing factor. It is exactly the same with neurosis. It is an attempt of the

self-regulating psychic system to restore the balance, in no way different from the function of dreams—only rather more forceful and drastic.

Dr. J. A. Hadfield:

[390] Would Professor Jung give us a short account of the technique of active imagination?

Professor Jung:

[391] That was the subject I really wanted to tell you about today in consequence of the analysis of the Toledo dream, so I am very glad to take it up. You will realize that I shall not be able to present any empirical material, but I may succeed in giving you an idea of the method. I believe that the best way is to tell you of a case where it was very difficult to teach the patient the method.

[392] I was treating a young artist, and he had the greatest trouble in understanding what I meant by active imagination. He tried all sorts of things but he could not get at it. The difficulty with him was that he could not think. Musicians, painters, artists of all kinds, often can't think at all, because they never intentionally use their brain. This man's brain too was always working for itself; it had its artistic imaginations and he couldn't use it psychologically, so he couldn't understand. I gave him every chance to try, and he tried all sorts of stunts. I cannot tell you all the things he did, but I will tell you how he finally succeeded in using his imagination psychologically.

[393] I live outside the town, and he had to take the train to get to my place. It starts from a small station, and on the wall of that station was a poster. Each time he waited for his train he looked at that poster. The poster was an advertisement for Mürren in the Bernese Alps, a colourful picture of the waterfalls, of a green meadow and a hill in the centre, and on that hill were several cows. So he sat there staring at that poster and thinking that he could not find out what I meant by active imagination. And then one day he thought: "Perhaps I could start by having a fantasy about that poster. I might for instance imagine that I am myself in the poster, that the scenery is real and that I could walk up the hill among the cows and

then look down on the other side, and then I might see what there is behind that hill."

[394] So he went to the station for that purpose and imagined that he was in the poster. He saw the meadow and the road and walked up the hill among the cows, and then he came up to the top and looked down, and there was the meadow again, sloping down, and below was a hedge with a stile. So he walked down and over the stile, and there was a little footpath that ran round a ravine, and a rock, and when he came round that rock, there was a small chapel, with its door standing a little ajar. He thought he would like to enter, and so he pushed the door open and went in, and there upon an altar decorated with pretty flowers stood a wooden figure of the Mother of God. He looked up at her face, and in that exact moment something with pointed ears disappeared behind the altar. He thought, "Well, that's all nonsense," and instantly the whole fantasy was gone.

[395] He went away and said, "Now again I haven't understood what active imagination is." And then, suddenly, the thought struck him: "Well, perhaps that really *was* there: perhaps that thing behind the Mother of God, with the pointed ears, that disappeared like a flash, really happened." Therefore he said to himself: "I will just try it all over as a test." So he imagined that he was back in the station looking at the poster, and again he fantasied that he was walking up the hill. And when he came to the top of the hill, he wondered what he would see on the other side. And there was the hedge and the stile and the hill sloping down. He said. "Well, so far so good. Things haven't moved since, apparently." And he went round the rock, and there was the chapel. He said: "There is the chapel, that at least is no illusion. It is all quite in order." The door stood ajar and he was quite pleased. He hesitated a moment and said: "Now, when I push that door open and I see the Madonna on the altar, then that thing with the pointed ears should jump down behind the Madonna, and if it doesn't, then the whole thing is bunk!" And so he pushed the door open and looked—and there it all was and the thing jumped down, as before, and then he was convinced. From then on he had the key and knew he could rely on his imagination, and so he learned to use it.

[396] There is no time to tell you about the development of his images, nor how other patients arrive at the method. For of course everybody gets at it in his own way. I can only mention that it might also be a dream or an impression of a hypnagogic nature from which active imagination can start. I really prefer the term "imagination" to "fantasy," because there is a difference between the two which the old doctors had in mind when they said that "opus nostrum," our work, ought to be done "per veram imaginationem et non phantastica"—by true imagination and not by a fantastical one.[13] In other words, if you take the correct meaning of this definition, fantasy is mere nonsense, a phantasm, a fleeting impression; but imagination is active, purposeful creation. And this is exactly the distinction I make too.

[397] A fantasy is more or less your own invention, and remains on the surface of personal things and conscious expectations. But active imagination, as the term denotes, means that the images have a life of their own and that the symbolic events develop according to their own logic—that is, of course, if your conscious reason does not interfere. You begin by concentrating upon a starting point. I will give you an example from my own experience. When I was a little boy, I had a spinster aunt who lived in a nice old-fashioned house. It was full of beautiful old coloured engravings. Among them was a picture of my grandfather on my mother's side. He was a sort of bishop, and he was represented as coming out of his house and standing on a little terrace. There were handrails and stairs coming down from the terrace, and a footpath leading to the cathedral. He was in full regalia, standing there at the top of the terrace. Every Sunday morning I was allowed to pay a call on my aunt, and then I knelt on a chair and looked at that picture until grandfather came down the steps. And each time my aunt would say, "But, my dear, he doesn't walk, he is still standing there." But I knew I had seen him walking down.

[398] You see how it happened that the picture began to move. And in the same way, when you concentrate on a mental picture, it begins to stir, the image becomes enriched by details, it moves and develops. Each time, naturally, you mistrust it and have the idea that you have just made it up, that it is merely your own invention. But you have to overcome that

doubt, because it is not true. We can really produce precious little by our conscious mind. All the time we are dependent upon the things that literally fall into our consciousness; therefore in German we call them *Einfälle*. For instance, if my unconscious should prefer not to give me ideas, I could not proceed with my lecture, because I could not invent the next step. You all know the experience when you want to mention a name or a word which you know quite well, and it simply does not present itself; but some time later it drops into your memory. We depend entirely upon the benevolent co-operation of our unconscious. If it does not co-operate, we are completely lost. Therefore I am convinced that we cannot do much in the way of conscious invention; we over-estimate the power of intention and the will. And so when we concentrate on an inner picture and when we are careful not to interrupt the natural flow of events, our unconscious will produce a series of images which make a complete story.

[399] I have tried that method with many patients and for many years, and I possess a large collection of such "opera." It is most interesting to watch the process. Of course I don't use active imagination as a panacea; there have to be definite indications that the method is suitable for the individual, and there are a number of patients with whom it would be wrong to force it upon them. But often in the later stage of analysis, the objectivation of images replaces the dreams. The images anticipate the dreams, and so the dream-material begins to peter out. The unconscious becomes deflated in so far as the conscious mind relates to it. Then you get all the material in a creative form and this has great advantages over dream-material. It quickens the process of maturation, for analysis is a process of quickened maturation. This definition is not my own invention; the old professor Stanley Hall invented the term.

[400] Since by active imagination all the material is produced in a conscious state of mind, the material is far more rounded out than the dreams with their precarious language. And it contains much more than dreams do; for instance, the feeling-values are in it, and one can judge it by feeling. Quite often, the patients themselves feel that certain material contains a tendency to visibility. They say, for instance: "That dream was so impressive, if I only could paint I would try to express its

atmosphere.” Or they feel that a certain idea should be expressed not rationally but in symbols. Or they are gripped by an emotion which, if given form, would be explainable, and so on. And so they begin to draw, to paint, or to shape their images plastically, and women sometimes do weaving. I have even had one or two women who danced their unconscious figures. Of course, they can also be expressed in writing.

[401] I have many complete series of such pictures. They yield an enormous amount of archetypal material. Just now I am about to work out the historical parallels of some of them. I compare them with the pictorial material produced in similar attempts in past centuries, particularly in the early Middle Ages. Certain elements of the symbolism go back to Egypt. In the East we find many interesting parallels to our unconscious material, even down to the last details. This comparative work gives us a most valuable insight into the structure of the unconscious. You have to hand the necessary parallels to the patients too, not of course in such an elaborate way as you would present it in a scientific study, but as much as each individual needs in order to understand his archetypal images. For he can see their real meaning only when they are not just a queer subjective experience with no external connections, but a typical, ever-recurring expression of the objective facts and processes of the human psyche. By objectifying his impersonal images, and understanding their inherent ideas, the patient is able to work out all the values of his archetypal material. Then he can really see it, and the unconscious becomes understandable to him. Moreover, this work has a definite effect upon him. Whatever he has put into it works back on him and produces a change of attitude which I tried to define by mentioning the non-ego centre.

[402] I will give you an interesting example. I had a case, a university man, a very one-sided intellectual. His unconscious had become troubled and activated; so it projected itself into other men who appeared to be his enemies, and he felt terribly lonely, because everybody seemed to be against him. Then he began to drink in order to forget his troubles, but he got exceedingly irritable and in these moods he began to quarrel with other men, and several times he had very disagreeable encounters, and once he was thrown out of a restaurant and got beaten up. And there were

more incidents of that sort. Then things became really too thick for his endurance, and he came to me to ask my advice about what he should do. In that interview, I got a very definite impression of him: I saw that he was chock-full of archaic material, and I said to myself: “Now I am going to make an interesting experiment to get that material absolutely pure, without any influence from myself, and therefore I won’t touch it.” So I sent him to a woman doctor who was then just a beginner and who did not know much about archetypal material. Thus I was absolutely sure that she would not tamper with it. The patient was in such low spirits that he did not object to my proposition. So he worked with her and did everything she said.[14]

[403] She told him to watch his dreams, and he wrote them all down carefully, from the first to the last. I now have a series of about thirteen hundred dreams of his. They contain the most marvellous series of archetypal images. And quite naturally, without being told to do so, he began to draw a number of pictures which he saw in his dreams, because he felt them to be very important. And in this work on his dreams and on these pictures he did exactly the kind of work which other patients do by active imagination. He even invented active imagination for himself in order to work out certain most intricate problems which his dreams presented him with, as for instance how to balance the contents of a circle, and more things like this. He worked out the problem of the *perpetuum mobile*, not in a crazy way but in a symbolic way. He worked on all the problems which medieval philosophy was so keen on and of which our rational mind says. “That is all nonsense.” Such a statement only shows that we do not understand. They did understand: we are the fools, not they.

[404] In the course of this analysis, which took him through about the first four hundred dreams, he was not under my surveillance. After the first interview I did not see him at all for eight months. He was five months with that doctor, and then for three months he was doing the work all by himself, continuing the observation of his unconscious with minute accuracy. He was very gifted in this respect. In the end, for about two months, he had a number of interviews with me. But I did not have to explain much of the symbolism to him.

[405] The effect of this work with his unconscious was that he became a perfectly normal and reasonable person. He did not drink any more, he became completely adapted and in every respect completely normal. The reason for this is quite obvious: that man—he was not married—had lived in a very one-sided intellectual way, and naturally had certain desires and needs also. But he had no chance with women at all, because he had no differentiation of feeling whatsoever. So he made a fool of himself with women at once, and of course they had no patience with him. And he made himself very disagreeable to men, so he was frightfully lonely. But now he had found something that fascinated him; he had a new centre of interest. He soon discovered that his dreams pointed to something very meaningful, and so his whole intuitive and scientific interest was aroused. Instead of feeling like a lost sheep, he thought: "Ah, when I am through with my work in the evening, I go to my study, and then I shall see what happens. I will work over my dreams, and then I shall discover extraordinary things." And so it was. Of course rational judgment would say that he just fell violently into his fantasies. But that was not the case at all. He did a real bit of hard work on his unconscious, and he worked out his images scientifically. When he came to me after his three months alone, he was already almost normal. Only he still felt uncertain; he was troubled because he could not understand some of the material he had dug up from the unconscious. He asked my advice about it, and I most carefully gave him certain hints as to its meaning, but only so far as this could help him to keep on with the work and carry it through.

[406] At the end of the year I am going to publish a selection from his first four hundred dreams, where I show the development of one motif only, the central motif of these archetypal images.[15] There will be an English translation later, and then you will have the opportunity to see how the method works in a case absolutely untouched by myself, or by any other outside suggestion. It is a most amazing series of images and really shows what active imagination can do. You understand, in this case it was only partially a method for objectifying the images in plastic form, because many of the symbols appeared directly in the dreams; but all the same it shows the kind of atmosphere which active imagination can

produce. I have patients who, evening after evening, work at these images, painting and shaping their observations and experiences. The work has a fascination for them; it is the fascination which the archetypes always exert upon consciousness. But by objectifying them, the danger of their inundating consciousness is averted and their positive effect is made accessible. It is almost impossible to define this effect in rational terms; it is a sort of "magical" effect, that is, a suggestive influence which goes out from the images to the individual, and in this way his unconscious is extended and is changed.

[407] I am told that Dr. Bennet has brought some pictures by a patient. Will he be so kind as to show them?

This picture (Figure 14) is meant to represent a bowl or vase. Of course it is very clumsily expressed and is a mere attempt, a suggestion of a vase or bowl. The motif of the vessel is itself an archetypal image which has a certain purpose, and I can prove from this picture what the purpose is. A vessel is an instrument for containing things. It contains for instance liquids, and prevents them from getting dispersed. Our German word for vessel is *Gefäss*, which is the noun of *fassen*, that is, to set, to contain, to take hold of. The word *Fassung* means the setting, and also, metaphorically, composure, to remain collected. So the vessel in this picture indicates the movement of containing in order to gather in and to hold together. You have to hold something together which otherwise would fall asunder. From the way this picture is composed, and from certain features in it, it is obvious that the psychology of this man contains a number of disparate elements. It is a picture characteristic of a schizophrenic condition. I do not know the case at all, but Dr. Bennet confirms that my conclusion is correct. You see the disparate elements all over the picture; there are a number of things which are not motivated and which don't belong together. Moreover, you see peculiar lines dividing the field. These lines are characteristic of a schizophrenic mentality; I call them the breaking lines. When a schizophrenic paints a picture of himself, he naturally expresses the schizophrenic split in his own mental structure, and so you find these breaking lines which often go right through a particular figure, like the breaking lines in a mirror. In this picture, the figures themselves show no breaking lines; they only go all over the field.

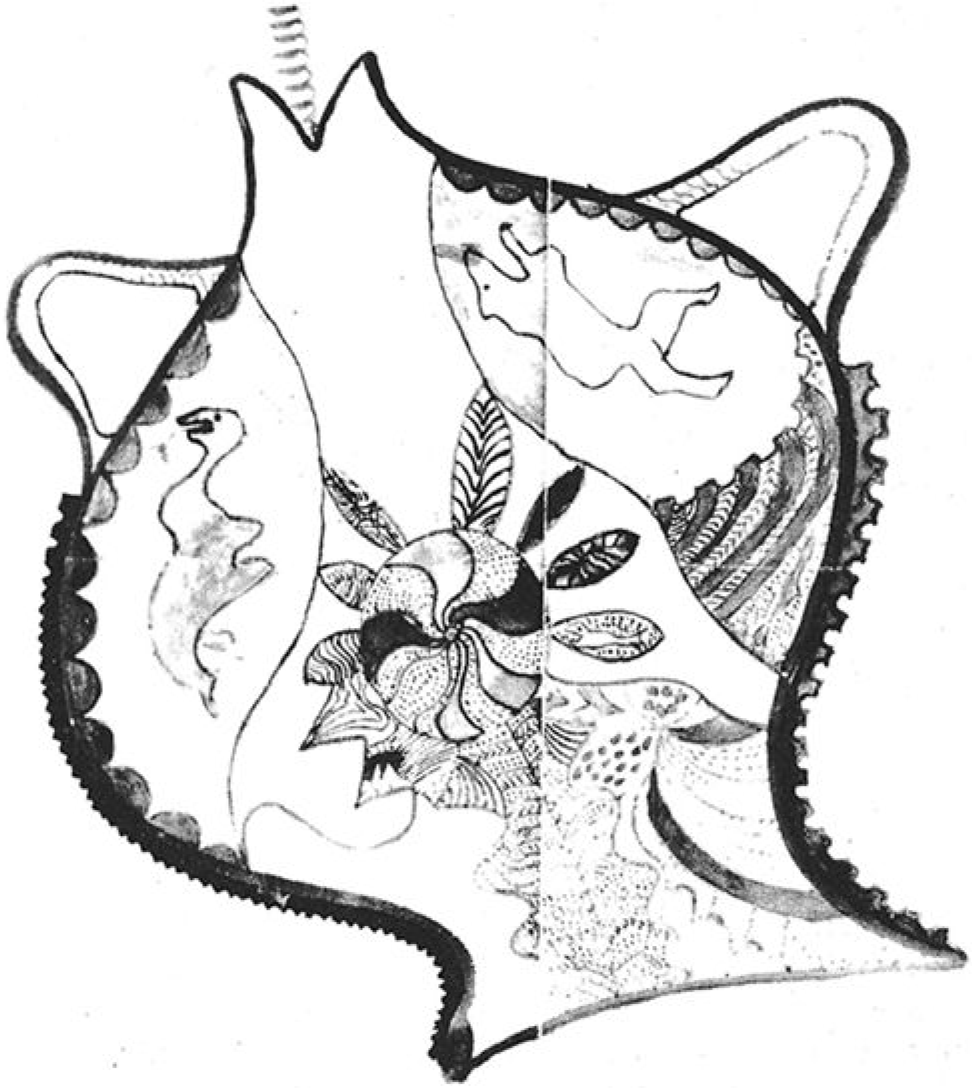

FIG.14. Painting by a patient

[408] This man, then, tries to gather in all the disparate elements into the vessel. The vessel is meant to be the receptacle for his whole being, for all the incompatible units. If he tried to gather them into his ego, it would be an impossible task, because the ego can be identical only with one part at a time. So he indicates by the symbol of the vessel that he is trying to find a container for everything, and therefore he gives a hint at a non-ego centre by that sort of ball or globe in the middle.

[409] The picture is an attempt at self-cure. It brings all the disparate elements into the light, and it also tries to put them together into that vessel. This idea of a receptacle is an archetypal idea. You find it everywhere, and it is one of the central motifs of unconscious pictures. It is the idea of the magic circle which is drawn round something that has to be prevented from escaping or protected against hostile influences. The magic circle as an apotropaic charm is an archaic idea which you still find in folklore. For instance, if a man digs for a treasure, he draws the magic circle round the field in order to keep the devil out. When the ground-plan of a city was set out, there used to be a ritual walk or ride round the circumference in order to protect the place within. In some Swiss villages, it is still the custom for the priest and the town council to ride round the fields when the blessing is administered for the protection of the harvest. In the centre of the magic circle or sacred precinct is the temple. One of the most wonderful examples of this idea is the temple of Borobudur in Java. The walk round, the *circumambulatio*, is done in a spiral: the pilgrims pass the figures of all the different lives of the Buddha, until on the top there is the invisible Buddha, the Buddha yet to come. The ground-plan of Borobudur is a circle within a square. This structure is called in Sanskrit a mandala. The word means a circle, particularly a magic circle. In the East, you find the mandala not only as the ground-plan of temples, but as pictures in the temples, or drawn for the day of certain religious festivals. In the very centre of the mandala there is the god or the symbol of divine energy, the diamond thunderbolt. Round this innermost circle is a cloister with four gates. Then comes a garden, and round this there is another circle which is the outer circumference.

[410] The symbol of the mandala has exactly this meaning of a holy place, a *temenos*, to protect the centre. And it is a symbol which is one of the most important motifs in the objectivation of unconscious images.[16] It is a means of protecting the centre of the personality from being drawn out and from being influenced from outside.

[411] This picture by Dr. Bennet’s patient is an attempt to draw such a mandala. It has a centre, and it contains all his psychic elements, and the vase would be the magic circle, the *temenos*, round which he has to do

the *circumambulatio*. Attention is thus directed towards the centre, and at the same time all the disparate elements come under observation and an attempt is made to unify them. The *cirumambulatio* had always to be done clockwise. If one turned round in the other direction it was very unfavourable. The idea of the *circumambulatio* in this picture is the patient's first attempt to find a centre and a container for his whole psyche. But he does not succeed. The design shows no balance, and the vase is toppling over. It even topples over towards the left, towards the side of the unconscious. So the unconscious is still too powerful. If he wants his apotropaic magic to work, he must do it in a different way. We shall see what he does in the next picture.

[412] In this picture (Figure 15) he makes an attempt at symmetry. Now these disparate, monstrous things which he could not grasp before are collected and assimilated into more favourable, less pathological forms. He can now gather the living units of his unconscious, in the form of snakes, into the sacred vase. And the vase stands firm, it does not topple over any more, and its shape has improved. He does not succeed yet with his intention; but at least he can give his animals some form. They are all animals of the underworld, fishes that live in the deep sea, and snakes of the darkness. They symbolize the lower centres of his psychology, the sympathetic system. A most remarkable thing is that he also gathers in the stars. That means that the cosmos, his world, is collected into the picture. It is an allusion to the unconscious astrology which is in our bones, though we are unaware of it. At the top of the whole picture is the personification of the unconscious, a naked anima-figure who turns her back. That is a typical position; in the beginning of the objectivation of these images the anima-figure often turns her back. At the foot of the vase are eight figures of the crescent moon; the moon is also a symbol of the unconscious. A man's unconscious is the lunar world, for it is the night world, and this is characterized by the moon, and Luna is a feminine designation, because the unconscious is feminine. There are still various breaking lines which disturb the harmony. But I should assume that if no particular trouble interferes, the patient will most likely continue along this constructive line. I should say that there is hope that he might come round altogether, because the appearance of the anima is

rather a positive sign. She also is a sort of vase, for in the beginning she incorporates the whole of the unconscious, instead of its being scattered in all the various units. Also, the patient tries to separate the motifs to the right and to the left, and this indicates an attempt at conscious orientation. The ball or globe in the first picture has disappeared, but this is not a negative sign. The whole vessel is the centre, and he has corrected the toppling over of the vase, it stands quite firmly on its base. All this shows that he is really making an attempt to put himself right.

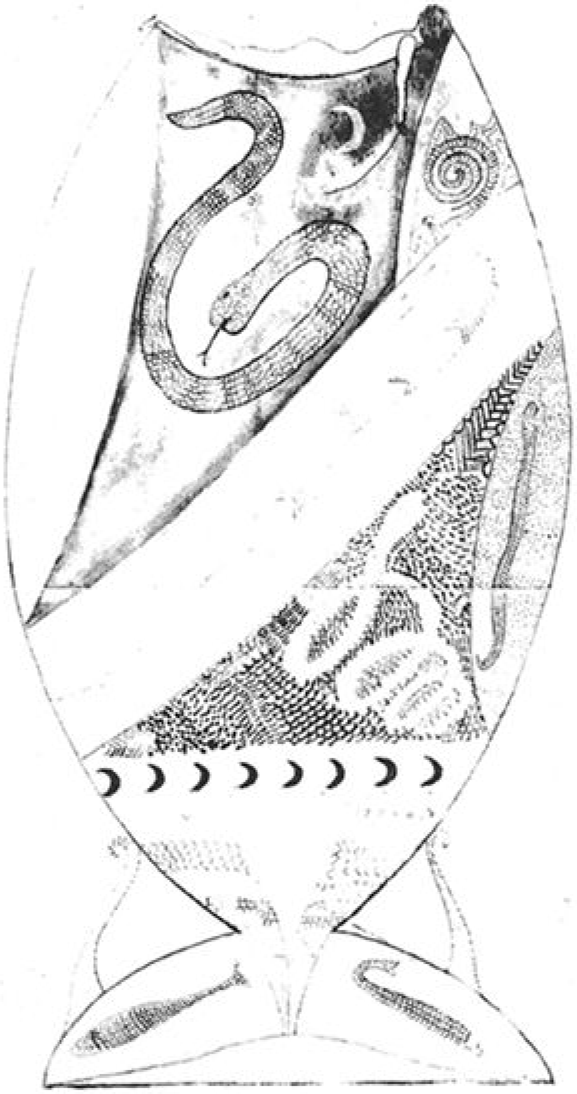

FIG.15. Painting by a patient

[413] The pictures should be given back to the patient because they are very important. You can get copies; patients like to do copies for the

doctor. But he should leave the originals with the patients, because they want to look at them; and when they look at them they feel that their unconscious is expressed. The objective form works back on them and they become enchanted. The suggestive influence of the picture reacts on the psychological system of the patient and induces the same effect which he put into the picture. That is the reason for idols, for the magic use of sacred images, of icons. They cast their magic into our system and put us right, provided we put ourselves into them. If you put yourself into the icon, the icon will speak to you. Take a Lamaic mandala which has a Budda in the centre, or a Shiva, and, to the extent that you can put yourself into it, it answers and comes into you. It has a magic effect.

[414] Because these pictures of the unconscious express the actual psychological condition of the individual, you can use them for the purpose of diagnosis. You can tell right away from such a picture where the patient stands, whether he has a schizophrenic disposition or is merely neurotic. You can even tell what his prognosis is. It only needs some experience to make these paintings exceedingly helpful. Of course, one should be careful. One should not be dogmatic and say to every patient, “Now you paint.” There are people who think: “Dr. Jung’s treatment consists in telling his patients to paint,” just as formerly they thought: “He divides them into introverts and extraverts and says ‘you should live in such and such a way, because you belong to this type or that.’ That is certainly not treatment. Each patient is a new problem for the doctor, and he will only be cured of his neurosis if you help him to find his individual way to the solution of his conflicts.

The Chairman:

[415] Ladies and Gentlemen, you have been expressing by your applause something of what you feel about Professor Jung. This is the last time in this group of talks that we will have the honour and pleasure and privilege of hearing Professor Jung. We have only inadequate ways of expressing our thanks to him for these lectures which have been so stimulating, so challenging, which have left us with so many things to think about in the future, things which to all of us, especially those who are practising psychotherapy, are enormously suggestive. I think that is

what you meant to do for us, Sir, and that is what you have done. We in this Institute are extremely proud to have had you here talking to us, and all of us, I think, are harbouring the idea that before long you will be back in England to talk to us again and make us think more about these great problems.

II

SYMBOLS AND THE INTERPRETATION OF DREAMS

[This essay was composed in English and completed shortly before Jung’s death in June 1961. Without title, it was written to introduce a symposium, *Man and His Symbols* (© 1964 Aldus Books, London), consisting of essays by Jung and four colleagues, edited by Jung and after his death by Dr. Marie-Louise von Franz, with John Freeman as co-ordinating editor. The symposium was conceived as a popular presentation of Jung’s ideas, and accordingly its contents were, with the authors’ agreement, extensively reworked under the supervision of John Freeman in collaboration with Dr. von Franz. Jung’s essay was largely rewritten and, particularly in the opening sections, rearranged; a number of deletions were made, some explanatory passages were added, and it was given the title “Approaching the Unconscious.” The present version is Jung’s original text, revised by R. F. C. Hull; except for some minor transpositions the original arrangement has been preserved. The illustrations (122 in the original edn.) have been omitted. Chapter divisions and titles have been introduced in consultation with Dr. von Franz. Acknowledgment is made to Aldus Books and Doubleday and Co. for permission to incorporate some stylistic improvements from the 1964 version.—EDITORS.]

1. THE SIGNIFICANCE OF DREAMS

[416] Through his language, man tries to designate things in such a way that his words will convey the meaning of what he intends to communicate. But sometimes he uses terms or images that are not strictly descriptive and can be understood only under certain conditions. Take, for instance, the many abbreviations like UN, UNESCO, NATO, etc., which infest our newspapers, or trademarks or the names of patent medicines. Although one cannot see what they mean, they yet have a definite meaning if you know it. Such designations are not *symbols*, they are *signs*. What we call a symbol is a term, a name, or an image which in itself may be familiar to us, but its connotations, use, and application are specific or peculiar and hint at a hidden, vague, or unknown meaning. Take as an example the image of the double adze that occurs frequently on Cretan monuments. We know the object, but we do not know its specific meaning. Again, a Hindu who had been on a visit to England told his friends at home that the English worshipped animals, because he had found eagles, lions, and oxen in their old churches and cathedrals, and he was not aware that these animals were the symbols of the evangelists. There are even many Christians who do not know that they are derived from the vision of Ezekiel, which in turn offers a parallel to the Egyptian Horus and his four sons. Other examples are the wheel and the cross, which are universally known objects, yet under certain conditions they are symbolic and mean something that is still a matter for controversial speculation.

[417] A term or image is symbolic when it means more than it denotes or expresses. It has a wider "unconscious" aspect—an aspect that can never be precisely defined or fully explained. This peculiarity is due to the fact that, in exploring the symbol, the mind is finally led towards ideas of a transcendent nature, where our reason must capitulate. The wheel, for instance, may lead our thoughts to the idea of a "divine" sun, but at this point reason has to admit its inadequacy, for we are unable to define or to establish the existence of a "divine" being. We are merely human, and

our intellectual resources are correspondingly limited. We may call something “divine,” but this is simply a name, a *façon de parler*. based perhaps on a creed, yet never amounting to a proof.

[418] Because there are innumerable things beyond the range of human understanding, we constantly use symbolic expressions and images when referring to them (ecclesiastical language in particular is full of symbols). But this conscious use of symbolism is only one aspect of a psychological fact of great importance: we also produce symbols unconsciously and spontaneously in our dreams.

[419] Each act of apperception, or cognition, accomplishes its task only partially: it is never complete. First of all, sense-perception, fundamental to all experience, is restricted by the limited number and quality of our senses, which can however be compensated to a certain extent by the use of instruments, but not sufficiently to eliminate entirely a fringe of uncertainty. Moreover apperception translates the observed fact into a seemingly incommensurable medium—into a psychic event, the nature of which is unknowable. Unknowable, because cognition cannot cognize itself—the psyche cannot know its own psychic substance. There is thus an indefinite number of unknown factors in every experience, in addition to which the object of cognition is always unknown in certain respects since we cannot know the ultimate nature of matter itself.

[420] Every conscious act or event thus has an unconscious aspect, just as every sense-perception has a subliminal aspect: for instance, sound below or above audibility, or light below or above visibility. The unconscious part of a psychic event reaches consciousness only indirectly, if at all. The event reveals the existence of its unconscious aspect inasmuch as it is characterized either by emotionality or by a vital importance that has not been realized consciously. The unconscious part is a sort of afterthought, which may become conscious in the course of time by means of intuition or by deeper reflection. But the event can also manifest its unconscious aspect—and this is usually the case —in a dream. The dream shows this aspect in the form of a symbolic image and not as a rational thought. It was the understanding of dreams that first enabled us to investigate the unconscious aspect of conscious psychic events and to discover its nature.

[421] It has taken the human mind a long time to arrive at a more or less rational and scientific understanding of the functional meaning of dreams. Freud was the first who tried to elucidate the unconscious background of consciousness in an empirical way. He worked on the general assumption that dream-contents are related to conscious representations through the law of association, i.e., by causal dependence, and are not merely chance occurrences. This assumption is by no means arbitrary but is based on the empirical fact, observed long ago by neurologists and especially by Pierre Janet, that neurotic symptoms are connected with some conscious experience. They even appear to be split-off areas of the conscious mind which, at another time and under different conditions, can be conscious, just as an hysterical anaesthesia can be there one moment and gone the next, only to reappear again after a while. Breuer and Freud recognized more than half a century ago that neurotic symptoms are meaningful and make sense inasmuch as they express a certain thought. In other words, they function in the same manner as dreams: they *symbolize.* A patient, for instance, confronted with an intolerable situation, develops a spasm whenever he tries to swallow: "He can't swallow it." Under similar conditions another patient develops asthma: "He can't breathe the atmosphere at home." A third suffers from a peculiar paralysis of the legs: "He can't go on any more." A fourth vomits everything he eats: "He can't stomach it." And so on. They could all just as well have had dreams of a similar kind.

[422] Dreams, of course, display a greater variety and are often full of picturesque and luxuriant fantasy, but they boil down eventually to the same basic thought if one follows Freud's original method of "free association." This method consists in letting the patient go on talking about his dream-images. That is precisely what the non-psychological doctor omits to do. Being always pressed for time, he loathes letting his patient babble on about his fantasies seemingly without end. Yet, if he only knew, his patient is just about to give himself away and to reveal the unconscious background of his ailment. Anyone who talks long enough will inevitably betray himself by what he says and what he purposely refrains from saying. He may try very hard to lead the doctor and himself away from the real facts, but after a while it is quite easy to see which

point he is trying to steer away from. Through apparently rambling and irrational talk, he unconsciously circumscribes a certain area to which he continually returns in ever-renewed attempts to hide it. In his circumlocutions he even makes use of a good deal of symbolism, apparently serving his purpose of hiding and avoiding yet pointing all the time to the core of his predicament.

[423] Thus, if the doctor is patient enough, he will hear a wealth of symbolic talk, seemingly calculated to hide something, a secret, from conscious realization. A doctor sees so many things from the seamy side of life that he is seldom far from the truth when he interprets the hints which his patient is emitting as signs of an uneasy conscience. What he eventually discovers, unfortunately, confirms his expectations. Thus far nobody can say anything against Freud's theory of repression and wish-fulfilment as apparent causes dream symbolism.

[424] If one considers the following experience, however, one becomes sceptical. A friend and colleague of mine, travelling for long hours on a train journey through Russia, passed the time by trying to decipher the Cyrillic script of the railway notices in his compartment. He fell into a sort of reverie about what the letters might mean and—following the principle of "free association"—what they reminded him of, and soon he found himself in the midst of all sorts of reminiscences. Among them, to his great displeasure, he did not fail to discover those old and disagreeable companions of sleepless nights, his "complexes"—repressed and carefully avoided topics which the doctor would joyously point to as the most likely causes of a neurosis or the most convincing meaning of a dream.

[425] There was no dream, however, merely "free associations" to incomprehensible letters, which means that from any point of the compass you can reach the centre directly. Through free association you arrive at the critical secret thoughts, no matter where you start from, be it symptoms, dreams, fantasies, Cyrillic letters or examples of modern art. At all events, this fact proves nothing with regard to dreams and their real meaning. It only shows the existence of associable material floating about. Very often dreams have a very definite, as if purposeful, structure,

indicating the underlying thought or intention though, as a rule, the latter is not immediately comprehensible.

[426] This experience was an eye-opener to me, and, without dismissing the idea of "association" altogether, I thought one should pay more attention to the dream itself, i.e., to its actual form and statement. For instance, a patient of mine dreamed of a drunken, dishevelled, vulgar woman called his "wife" (though in reality his wife was totally different). The dream statement, therefore, is shocking and utterly unlike reality, yet that is what the dream says. Naturally such a statement is not acceptable and is immediately dismissed as dream nonsense. If you let the patient associate freely to the dream, he will most likely try to get away as far as possible from such a shocking thought in order to end up with one of his staple complexes, but you will have learnt nothing about the meaning of this particular dream. What is the unconscious trying to convey by such an obviously untrue statement?

[427] If somebody with little experience and knowledge of dreams should think that dreams are just chaotic occurrences without meaning, he is at liberty to do so. But if one assumes that they are normal events, which as a matter of fact they are, one is bound to consider that they are either causal—i.e., that there is a rational cause for their existence—or in some way purposive, or both; in other words, that they make sense.

[428] Clearly, the dream is seeking to express the idea of a degenerate female who is closely connected with the dreamer. This idea is projected upon his wife, where the statement becomes untrue. What does it refer to, then?

[429] Subtler minds in the Middle Ages already knew that every man "carries Eve, his wife, hidden in his body."[1] It is this feminine element in every man (based on the minority of female genes in his biological make-up) which I have called the *anima*. "She" consists essentially in a certain inferior kind of relatedness to the surroundings and particularly to women, which is kept carefully concealed from others as well as from oneself. A man's visible personality may seem quite normal, while his anima side is sometimes in a deplorable state. This was the case with our dreamer: his female side was not nice. Applied to his anima, the dream-statement hits the nail on the head when it says: you are behaving like a

degenerate female. It hits him hard as indeed it should. One should not, however, understand such a dream as evidence for the *moral nature* of the unconscious. It is merely an attempt to balance the lopsidedness of the conscious mind, which had believed the fiction that one was a perfect gentleman throughout.

[430] Such experiences taught me to mistrust free association. I no longer followed associations that led far afield and away from the manifest dream-statement. I concentrated rather on the actual dream-text as the thing which was intended by the unconscious, and I began to circumambulate the dream itself, never letting it out of my sight, or as one turns an unknown object round and round in one's hands to absorb every detail of it.

[431] But why should one consider dreams, those flimsy, elusive, unreliable, vague, and uncertain phantasms, at all? Are they worthy of our attention? Our rationalism would certainly not recommend them, and the history of dream interpretation before Freud was a sore point anyway; most discouraging in fact, most "unscientific" to say the least of it. *Yet dreams are the commonest and universally accessible source for the investigation of man's symbolizing faculty,* apart from the contents of psychoses, neuroses, myths, and the products of the various arts. All these, however, are more complicated and more difficult to understand, because, when it comes to the question of their individual nature, one cannot venture to interpret such unconscious products without the aid of the originator. Dreams are indeed the chief source of all our knowledge about symbolism.

[432] One cannot *invent* symbols; wherever they occur, they have not been devised by conscious intention and wilful selection, because, if such a procedure had been used, they would have been nothing but signs and abbreviations of conscious thoughts. Symbols occur to us spontaneously, as one can see in our dreams, which are not invented but which happen to us. They are not immediately understandable, they need careful analysis by means of association, but, as I have said, not of "free association," which we know always leads back eventually to the emotional thoughts or complexes that are unconsciously captivating our mind. To get there, we have no need of dreams. But in the early days of medical psychology

the general assumption was that dreams were analysed for the purpose of discovering complexes. For this purpose, however, it is sufficient to conduct an association test, which supplies all the necessary hints as I have shown long ago. And not even this test is necessary, because one can obtain the same result by letting people talk long enough.

[433] There can be no doubt that dreams often arise from an emotional disturbance in which the habitual complexes are involved. The habitual complexes are the tender spots of the psyche, which react most quickly to a problematical external situation. But I began to suspect that dreams might have another, more interesting function. The fact that they eventually lead back to the complexes is not the specific merit of dreams. If we want to learn what a dream means and what specific function it fulfils, we must disregard its inevitable outcome, the complex. We must put a check on limitless "free" association, a restriction provided by the dream itself. By free association, we move away from the individual dream-image and lose sight of it. We must, on the contrary, keep close to the dream and its individual form. The dream is its own limitation. It is itself the criterion of what belongs to it and of what leads away from it. All material that does not lie within the scope of the dream, or that oversteps the boundaries set by its individual form, leads astray and produces nothing but the complexes, and we do not know whether they belong to the dream or not since they can be produced in so many other ways. There is, for instance, an almost infinite variety of images by which the sexual act can be "symbolized," or rather allegorized. But the dream obviously intends its own specific expression in spite of the fact that the resultant associations will lead to the idea of sexual intercourse. This is no news and is easy to see, but the real task is to understand why the dream has chosen its own individual expression.

[434] Only the material that is clearly and visibly indicated as belonging to the dream by the dream-images themselves should be used for interpretation. While free association moves away from the theme of the dream in something like a zigzag line, the new method, as I have always said, is more like a circumambulation, the centre of which is the dream-image. One concentrates on the specific topics, on the dream itself, and disregards the frequent attempts of the dreamer to break away from it.

This ever-present "neurotic" dissociative tendency has many aspects, but at bottom it seems to consist in a basic resistance of the conscious mind to anything unconscious and unknown. As we know, this often fierce resistance is typical of the psychology of primitive societies, which are as a rule conservative and show pronounced misoneistic tendencies. Anything new and unknown causes distinct and even superstitious fear. The primitive manifests all the reactions of a wild animal to untoward events. Our highly differentiated civilization is not at all free from such primitive behaviour. A new idea that is not exactly in line with general expectations meets with the severest obstacles of a psychological kind. It is given no credit, but is feared, combatted, and abhorred in every way. Many pioneers can tell a story of misery, all due to the primitive misoneism of their contemporaries. When it comes to psychology, one of the youngest of the sciences, you can see misoneism at work, and in dealing with your own dreams you can easily observe your reactions when you have to admit a disagreeable thought. It is chiefly and above all fear of the unexpected and unknown that makes people eager to use free association as a means of escape. I do not know how many times in my professional work I have had to repeat the words: "Now let's get back to your dream. What does the *dream* say?"

[435] If one wants to understand a dream it must be taken seriously, and one must also assume that it means what it manifestly says, since there is no valid reason to suppose that it is anything other than it is. Yet the apparent futility of dreams is so overwhelming that not only the dreamer but the interpreter as well may easily succumb to the prejudice of the "nothing but" explanation. Whenever a dream gets difficult and obstinate, the temptation to dismiss it altogether is not far away.

[436] When I was doing fieldwork with a primitive tribe in East Africa, I discovered to my amazement that they denied having dreams at all. But by patient indirect talk I soon found that they had dreams all right, like everybody else, but were convinced that their dreams meant nothing. "Dreams of ordinary men mean nothing," they said. The only dreams that mattered were those of the chief and the medicine-man, which concerned the welfare of the tribe. Such dreams were highly appreciated. The only drawback was that the chief as well as the medicine-man denied having

any more dreams "since the British were in the country." The District Commissioner had taken over the function of the "big dream."

[437] This incident shows that even in a primitive society opinions about dreams are ambivalent, just as in our society, where most people see nothing in dreams while a minority thinks very highly of them. The Church, for instance, has long known of *somnia a Deo missa* (dreams sent by God), and in our own time we have watched the growth of a scientific discipline which aims at exploring the vast field of unconscious processes. Yet the average man thinks little or nothing about dreams, and even a thoroughly educated person shares the common ignorance and underrates everything remotely connected with the "unconscious."

[438] The very existence of an unconscious psyche is denied by a great number of scientists and philosophers, who often use the naïve argument that if there were an unconscious psyche there would be two subjects in the individual instead of one. But that is precisely the case, in spite of the supposed unity of the personality. It is, indeed, the great trouble of our time that so many people exist whose right hand does not know what their left is doing. It is by no means the neurotic alone who finds himself in this predicament. It is not a recent development, nor can it be blamed on Christian morality; it is, on the contrary, the symptom of a general unconsciousness that is the heritage of all mankind.

[439] The development of consciousness is a slow and laborious process that took untold ages to reach the civilized state (which we date somewhat arbitrarily from the invention of writing, about 4000 B.C.). Although the development since that date seems to be considerable, it is still far from complete. Indefinitely large areas of the mind still remain in darkness. What we call "psyche" is by no means identical with consciousness and its contents. Those who deny the existence of the unconscious do not realize that they are actually assuming our knowledge of the psyche to be complete, with nothing left for further discoveries. It is exactly as if they declared our present knowledge of nature to be the summit of all possible knowledge. Our psyche is part of nature, and its enigma is just as limitless. We cannot define "nature" or "psyche," but can only state what, at present, we understand them to be. No man in his senses, therefore, could make such a statement as "there is no

unconscious," i.e., no psychic contents of which he and others are unconscious—not to mention the mountain of convincing evidence that medical science has accumulated. It is not, of course, scientific responsibility or honesty that causes such resistance, but age-old misoneism, fear of the new and unknown.

[440] This peculiar resistance to the unknown part of the psyche has its historical reasons. Consciousness is a very recent acquisition and as such is still in an "experimental state"—frail, menaced by specific dangers, and easily injured. As a matter of fact one of the most common mental derangements among primitives consists in the "loss of a soul," which, as the term indicates, means a noticeable dissociation of consciousness. On the primitive level the psyche or soul is by no means a unit, as is widely supposed. Many primitives assume that, as well as his own, a man has a "bush-soul," incarnate in a wild animal or a tree, with which he is connected by a kind of psychic identity. This is what Lévy-Bruhl called *participation mystique*.[2] In the case of an animal it is a sort of brother, so much so that a man whose brother is a crocodile is supposed to be safe while swimming across a crocodile-infested river. In the case of a tree, the tree is supposed to have authority over the individual like a parent. Injury to the bush-soul means an equal injury to the man. Others assume that a man has a number of souls, which shows clearly that the primitive often feels that he consists of several units. This indicates that his psyche is far from being safely synthesized; on the contrary, it threatens to fall asunder only too easily under the onslaught of unchecked emotions.

[441] What we observe in the seemingly remote sphere of the primitive mind has by no means vanished in our advanced civilization. Only too often, as I have said, the right hand does not know what the left is doing, and in a state of violent affect one frequently forgets who one is, so that people can ask: "What the devil has got into you?" We are possessed and altered by our moods, we can suddenly be unreasonable, or important facts unaccountably vanish from our memory. We talk about being able to "control ourselves," but self-control is a rare and remarkable virtue. If you ask your friends or relatives they may be able to tell you things about yourself of which you have no knowledge. One almost always forgets or

omits to apply to oneself the criticism that one hands out so freely to others, fascinated by the mote in one's brother's eye.

[442] All these well-known facts show beyond a doubt that, on the heights of our civilization, human consciousness has not yet attained a reasonable degree of continuity. It is still dissociable and vulnerable, in a way fortunately so, since the dissociability of the psyche is also an advantage in that it enables us to concentrate on one point by dismissing everything else that might claim attention. It makes a great difference, however, whether your consciousness purposely splits off and suppresses a part of the psyche temporarily, or whether the same thing *happens* to you, so that the psyche splits spontaneously without your consent and knowledge, or perhaps even against your will. The first is a civilized achievement, the second a primitive and archaic condition or a pathological event and the cause of a neurosis. It is the "loss of a soul," the symptom of a still existing mental primitivity.

[443] It is a long way indeed from primitivity to a reliable cohesion of consciousness. Even in our days the unity of consciousness is a doubtful affair, since only a little affect is needed to disrupt its continuity. On the other hand the perfect control of emotion, however desirable from one point of view, would be a questionable accomplishment, for it would deprive social intercourse of all variety, colour, warmth, and charm.

2. THE FUNCTIONS OF THE UNCONSCIOUS

[444] Our *new* method treats the dream as a spontaneous product of the psyche about which there is no previous assumption except that it somehow makes sense. This is no more than every science assumes, namely that its object is worthy of investigation. No matter how low one's opinion of the unconscious may be, the unconscious is at least on a level with the louse, which, after all, enjoys the honest interest of the entomologist. As to the alleged boldness of the hypothesis that an unconscious psyche exists, I must emphasize that a more modest formulation could hardly be imagined. It is so simple that it amounts to a tautology: a content of consciousness disappears and cannot be reproduced. The best we can say of it is: the thought (or whatever it was) has become unconscious, or is cut off from consciousness, so that it cannot even be remembered. Or else it may happen that we have an inkling or hunch of something which is about to break into consciousness: "something is in the air," "we smell a rat," and so on. To speak under these conditions of latent or unconscious contents is hardly a daring hypothesis.

[445] When something vanishes from consciousness it does not dissolve into thin air or cease to exist, any more than a car disappearing round a corner becomes non-existent. It is simply out of sight, and, as we may meet the car again, so we may come across a thought again which was previously lost. We find the same thing with sensation, as the following experiment proves. If you produce a continuous note on the edge of audibility, you will observe in listening to it that at regular intervals it is audible and inaudible. These oscillations are due to a periodic increase and decrease of attention. The note never ceases to exist with static intensity. It is merely the decrease of attention that causes its apparent disappearance.

[446] The unconscious, therefore, consists in the first place of a multitude of temporarily eclipsed contents which, as experience shows, continue to

influence the conscious processes. A man in a distracted state of mind goes to a certain place in his room, obviously to fetch something. Then he suddenly stops perplexed: he has forgotten why he got up and what he was after. He gropes absent-mindedly among a whole collection of objects, completely at sea as to what he wants to find. Suddenly he wakes up, having discovered the thing he wants. He behaves like a man walking in his sleep oblivious of his original purpose, yet unconsciously guided by it. If you observe the behaviour of a neurotic, you can see him performing apparently conscious and purposeful acts yet, when you ask him about them, you discover to your surprise that he is either unconscious of them or has something quite different in mind. He hears and does not hear, he sees yet is blind, he knows and does not know at the same time. Thousands of such observations have convinced the specialist that unconscious contents behave as if they were conscious, and that you can never be sure whether thought, speech, or action is conscious or not. Something so obvious to yourself that you cannot imagine it to be invisible to anybody can be as good as nonexistent to your fellows, and yet they behave as if they were just as conscious of it as you are yourself.

[447] This kind of behaviour has given rise to the medical prejudice that hysterical patients are confirmed liars. Yet the surplus of lies they seem to produce is due to the uncertainty of their mental state, to the dissociability of their consciousness, which is liable to unpredictable eclipses, just as their skin shows unexpected and changing areas of anaesthesia. There is no certainty whether a needle-prick will be registered or not. If their attention can be focused on a certain point, the whole surface of their body may be completely anaesthetized, and, when attention relaxes, sense-perception is instantly restored. Moreover when one hypnotizes such cases one can easily demonstrate that they are aware of everything that has been done in an anaesthetized area or during an eclipse of consciousness. They can remember every detail just as if they had been fully conscious during the experiment. I recall a similar case of a woman who was admitted to the clinic in a state of complete stupor. Next day when she came to, she knew who she was, but did not know where she was nor how or why she had come there, nor did she know the

date. I hypnotized her, and she could tell me a verifiable story of why she fell ill, how she had got to the clinic, and who had received her, with all the details. As there was a clock in the entrance hall, though not in a very conspicuous place, she could also remember the time of her admission to the minute. Everything happened as if she had been in a completely normal condition and not deeply unconscious.

[448] It is true that the bulk of our evidential material comes from clinical observation. That is the reason why many critics assume that the unconscious and its manifestations belong to the sphere of psychopathology as neurotic or psychotic symptoms and that they do not occur in a normal mental state. But, as has been pointed out long ago, neurotic phenomena are not by any means the exclusive products of disease. They are as a matter of fact *normal occurrences pathologically exaggerated, and therefore* just more obvious than their normal parallels. One can indeed observe all hysterical symptoms in a diminutive form in normal individuals, but they are so slight that they usually pass unnoticed. In this respect, everyday life is a mine of evidential material.

[449] Just as conscious contents can vanish into the unconscious, other contents can also arise from it. Besides a majority of mere recollections, really new thoughts and creative ideas can appear which have never been conscious before. They grow up from the dark depths like a lotus, and they form an important part of the subliminal psyche. This aspect of the unconscious is of particular relevance in dealing with dreams. One must always bear in mind that dream material does not necessarily consist of memories; it may just as well contain new thoughts that are not yet conscious.

[450] Forgetting is a normal process, in which certain conscious contents lose their specific energy through a deflection of attention. When interest turns elsewhere, it leaves former contents in the shadow, just as a searchlight illuminates a new area by leaving another to disappear in the darkness. This is unavoidable, for consciousness can keep only a few images in full clarity at one time, and even this clarity fluctuates, as I have mentioned. “Forgetting” may be defined as temporarily subliminal contents remaining outside the range of vision against one’s will. But the forgotten contents have not ceased to exist. Although they cannot be

reproduced they are present in a subliminal state, from which they can rise up spontaneously at any time, often after many years of apparently total oblivion, or they can be fetched back by hypnosis.

[451] Besides normal forgetting, there are the cases described by Freud of disagreeable memories which one is only too ready to lose. As Nietzsche has remarked, when pride is insistent enough, memory prefers to give way. Thus among the lost memories we encounter not a few that owe their subliminal state (and their incapacity to be reproduced at will) to their disagreeable and incompatible nature. These are the *repressed* contents.

[452] As a parallel to normal forgetting, *subliminal sense-perceptions* should be mentioned, because they play a not unimportant role in our daily life. We see, hear, smell and taste many things without noticing them at the time, either because our attention is deflected or because the stimulus is too slight to produce a conscious impression. But in spite of their apparent non-existence they can influence consciousness. A well-known example is the case of the professor walking in the country with a pupil, deep in serious conversation. Suddenly he notices that his thoughts are interrupted by an unexpected flow of memories from his early childhood. He cannot account for it, as he is unable to discover any associative connection with the subject of his conversation. He stops and looks back: there at a little distance is a farm, through which they had passed a short while ago, and he remembers that soon afterwards images of his childhood began to surge up. “Let us go back to the farm,” he says to his pupil; “it must be about there that my fantasies started.” Back at the farm, the professor notices the smell of geese. Instantly he recognizes it as the cause of the interruption: in his early youth he had lived on a farm where there were geese, whose characteristic smell had formed a lasting impression and caused the reproduction of the memory-images. He had noticed the smell while passing the farmyard, subliminally, and the unconscious perception had called back long-forgotten memories.

[453] This example illustrates how the subliminal perception released early childhood memories, the energic tension of which proved to be strong enough to interrupt the conversation. The perception was subliminal because the attention was engaged elsewhere, and the stimulus was not

strong enough to deflect it and to reach consciousness directly. Such phenomena are frequent in everyday life, but mostly they pass unnoticed.

[454] A relatively rare but all the more astonishing phenomenon that falls into the same category is *cryptomnesia*, or the "concealed recollection." It consists in the fact that suddenly, mostly in the flow of creative writing, a word, a sentence, an image, a metaphor, or even a whole story appears which may exhibit a strange or otherwise remarkable character. If you ask the author where this fragment comes from, he does not know, and it becomes obvious that he has not even noticed it as anything peculiar. I will quote one such example from Nietzsche's *Thus Spake Zarathustra*. The author describes Zarathustra's "descent to hell" with certain characteristic details which coincide almost word for word with the narration in a ship's log from the year 1686.

[455] Nietzsche, *Thus Spake Zarathustra* (1883)[1]

> Now about the time that Zarathustra sojourned on the Happy Isles, it happened that a ship anchored at the isle on which the smoking mountain stands, and the crew went ashore to shoot rabbits. About the noontide hour, however, when the captain and his men were together again, they suddenly saw a man coming towards them through the air, and a voice said distinctly: "It is time! It is highest time!" But when the figure drew close to them, flying past quickly like a shadow in the direction of the volcano, they recognized with the greatest dismay that it was Zarathustra. … "Behold," said the old helmsman, "Zarathustra goes down to hell!"

Justinus Kerner, *Blätter aus Prevorst* (1831–39) [2]

> The four captains and a merchant, Mr. Bell, went ashore on the island of Mount Stromboli to shoot rabbits. At three o'clock they mustered the crew to go aboard, when, to their inexpressible astonishment, they saw two men flying rapidly towards them through the air. One was dressed in black, the other in grey. They came past them very closely, in the greatest haste, and to their utmost dismay descended into the crater of the terrible volcano, Mount Stromboli. They recognized the pair as acquaintances from London.

[456] When I read Nietzsche’s story I was struck by its peculiar style, which is different from Nietzsche’s usual language, and by the strange images of a ship anchored off a mythological island, of a captain and his crew shooting rabbits, and of the descent to hell of a man who was recognized as an old acquaintance. The parallels with Kerner could not be a mere coincidence. Kerner’s collection dates from about 1835 and is probably the only extant source of the seaman’s yarn. At least I was certain that Nietzsche must have gleaned it from there. He retells the story with a few significant variations and as if it were his own invention. As it was in the year 1902 that I came across this case, I still had the opportunity to write to Elizabeth Förster-Nietzsche, the author’s sister, and she remembered that she and her brother had read the *Blätter aus Prevorst* when Nietzsche was eleven years old, though she did not remember this particular story. The reason why I remembered it was that I had come across Kerner’s collection four years before, in a private library; and, as I was interested in the writings of the physicians of that time as the forerunners of medical psychology, I had read through all the volumes of the *Blätter*. Naturally I should have forgotten the yarn in the course of time, because it did not interest me in any way. But in reading Nietzsche I suddenly had a *sentiment du déjà vu*, followed by a dim recollection of old-fashioned cut, and gradually the picture of Kerner’s book filtered into my consciousness.

[457] Benoît, who produced a surprising parallel to Rider Haggard’s *She* in his novel *L’Atlantide*, when accused of plagiarism had to answer that he had never come across Rider Haggard’s book and was entirely unaware of its existence. This case could also have been one of cryptomnesia, if it had not been an elaboration of a sort of *representation collective*, as Lévy-Bruhl has named certain general ideas characteristic of primitive societies. I shall be dealing with these later on.

[458] What I have said about the unconscious will give the reader a fair idea of the subliminal material on which the spontaneous production of dream-symbols is based. It is evidently material that owes its unconsciousness chiefly to the fact that certain conscious contents must necessarily lose their energy, i.e., the attention bestowed on them, or their specific emotional tone, in order to make room for new contents. If they

were to retain their energy, they would remain above the threshold and one could not get rid of them. It is as if consciousness were a sort of projector that casts its light (of attention or interest) on new perceptions—due to arrive presently—as well as on the traces of former ones in a dormant state. As a conscious act, this process can be understood as an intentional and voluntary event. Yet just as often consciousness is forced to turn on its light by the intensity of an external or internal stimulus.

[459] This observation is not superfluous, for there are many people who overestimate the role of will-power and think nothing can happen in their minds that they do not intend. But, for the sake of psychological understanding, one should learn to discriminate carefully between *intentional and unintentional contents*. The former are derived from the ego-personality, while the latter arise from a source which is not identical with the ego, that is, from a subliminal part of the ego, from its "other side," which is in a way another subject. The existence of this other subject is by no means a pathological symptom, but a normal fact that can be observed at any time anywhere.

[460] I once had a discussion with one of my colleagues about another doctor who had done something I had qualified as "utterly idiotic." This doctor was my colleague's personal friend, and moreover a believer in the somewhat fanatical creed to which my colleague subscribed. Both were teetotalers. He impulsively replied to my criticism: "Of course he is an ass"—pulling himself up short—"a highly intelligent man, I meant to say." I mildly remarked that the ass came first, whereupon he angrily denied ever having said such a thing about his friend, and to an unbeliever at that. This man was highly regarded as a scientist, but his right hand did not know what his left was doing. Such people are not fit for psychology and, as a matter of fact, do not like it. But that is the way the voice from the other side is usually treated: "I didn't mean it, I never said so." And in the end, as Nietzsche says, memory prefers to give way.

3. THE LANGUAGE OF DREAMS

[461] All contents of consciousness have been or can become subliminal, thus forming part of the psychic sphere which we call the unconscious. All urges, impulses, intentions, affects, all perceptions and intuitions, all rational and irrational thoughts, conclusions, inductions, deductions, premises, etc., as well as all categories of feeling, have their subliminal equivalents, which may be subject to partial, temporary, or chronic unconsciousness. One uses a word or a concept, for instance, that in another connection has an entirely different meaning of which one is momentarily unconscious, and this can lead to a ridiculous or even disastrous misunderstanding. Even a most carefully defined philosophical or mathematical concept, which we are sure does not contain more than we have put into it, is nevertheless more than we assume. It is at the least a psychic event, the nature of which is actually unknowable. The very numbers you use in counting are more than you take them for. They are at the same time mythological entities (for the Pythagoreans they were even divine), but you are certainly unaware of this when you use numbers for a practical purpose.

[462] We are also unconscious of the fact that general terms like “state,” “money,” “health,” “society” etc. usually mean more than they are supposed to signify. They are general only because we assume them to be so, but in practical reality they have all sorts of nuances of meaning. I am not thinking of the deliberate twisting of such concepts in their Communist usage, but of the fact that even when they are understood in their proper sense they nevertheless vary slightly from person to person. The reason for this variation is that a general notion is received into an individual context and is therefore understood and used in an individual way. As long as concepts are identical with mere words, the variation is almost imperceptible and of no practical importance. But when an exact definition or a careful explanation is needed, one can occasionally discover the most amazing variations, not only in the purely intellectual understanding of the term, but particularly in its emotional tone and its

application. As a rule these variations are subliminal and therefore never realized.

[463] One may dismiss such differences as redundant or over-nice distinctions, but the fact that they exist shows that even the most banal contents of consciousness have a penumbra of uncertainty around them, which justifies us in thinking that each of them carries a definite subliminal charge. Although this aspect plays little role in everyday life, one must bear it in mind when analysing dreams. I recall a dream of my own that baffled me for a while. In this dream, a certain Mr. X was desperately trying to get behind me and jump on my back. I knew nothing of this gentleman except that he had succeeded in twisting something I had said into a rather grotesque travesty of my meaning. This kind of thing had frequently happened to me in my professional life, and I had never bothered to realize whether it made me angry or not. But as it is of practical importance to maintain conscious control of one's emotions, the dream pointedly brought up the incident again in the apparent "disguise" of a colloquialism. This saying, common enough in ordinary speech, is "Du kannst mir auf den Buckel steigen" (you can climb on my back), which means "I don't give a damn what you say."

[464] One could say that this dream-image was symbolic, for it did not state the situation directly but in a roundabout way, through a concretized colloquial metaphor which I did not understand at first sight. Since I have no reason to believe that the unconscious has any intention of concealing things, I must be careful not to project such a device on its activity. It is characteristic of dreams to prefer pictorial and picturesque language to colourless and merely rational statements. This is certainly not an intentional concealment; it simply emphasizes our inability to understand the emotionally charged picture-language of dreams.

[465] As daily adaptation to the reality of things demands accurate statements, we have learnt to discard the trimming of fantasy, and have thus lost a quality that is still characteristic of the primitive mind. Primitive thinking sees its object surrounded by a fringe of associations which have become more or less unconscious in civilized man. Thus animals, plants, and inanimate objects can acquire properties that are most unexpected to the white man. A nocturnal animal seen by day is, for

the primitive, quite obviously a medicine-man who has temporarily changed his shape; or else it is a doctor-animal or an animal-ancestor, or somebody's bush-soul. A tree can be part of a man's life, it has a soul and a voice, and the man shares its fate, and so on. Certain South American Indians assure you that they are red *araras* (parrots), although they are quite aware that they have no feathers and don't look like birds. In the primitive's world, things do not have the same sharp boundaries they do in ours. What we call psychic identity or *participation mystique has* been stripped off our world of things. It is exactly this halo, or "fringe of consciousness," as William James calls it, which gives a colourful and fantastic aspect to the primitive's world. We have lost it to such a degree that we do not recognize it when we meet it again, and are baffled by its incomprehensibility. With us such things are kept below the threshold; and when they occasionally reappear, we are convinced that something is wrong.

[466] I have more than once been consulted by highly educated and otherwise intelligent people because they had peculiar dreams, involuntary fantasies, or even visions, which shocked or frightened them. They assumed that nobody in a sound mental condition could suffer from such phenomena, and that a person who had a vision was certainly pathological. A theologian I knew once avowed his belief that Ezekiel's visions were morbid symptoms, and that when Moses and other prophets heard "voices" they were suffering from hallucinations. Naturally he got into a panic when some spontaneous events of this kind happened to him. We are so used to the rational surface of our world that we cannot imagine anything untoward happening within the confines of common sense. If our mind once in a while does something thoroughly unexpected, we are terrified and immediately think of a pathological disturbance, whereas primitive man would think of fetishes, spirits, or gods but would never doubt his sanity. Modern man is very much in the situation of the old doctor who was himself a psychotic patient. When I asked him how he was, he replied that he had had a wonderful night disinfecting the whole heaven with chloride of mercury but had found no trace of God. What we find instead of God is a neurosis or something worse, and the fear of God has changed into a phobia or anxiety neurosis.

The emotion remains the same, only its object has changed its name and nature for the worse.

[467] I remember a professor of philosophy and psychology who consulted me about his cancer phobia. He suffered from a compulsive conviction that he had a malignant tumour, although nothing of the sort was ever found in dozens of X-ray pictures. “Oh, I know there is nothing,” he would say, “but there still *might* be something.” Such a confession is certainly far more humiliating to a strong intellect than the belief of a primitive that he is plagued by a ghost. Malevolent spirits are at least a perfectly admissible hypothesis in a primitive society, but it is a shattering experience for a civilized person to have to admit that he is the victim of nothing more than a foolish prank of the imagination. The primitive phenomenon of obsession has not vanished, it is the same as ever. It is only interpreted in a different and more obnoxious way.

[468] Many dreams present images and associations that are analogous to primitive ideas, myths, and rites. These dream-images were called “archaic remnants” by Freud. The term suggests that they are psychic elements left over from times long ago and still adhering to our modern mind. This point of view forms part of the prevailing depreciation of the unconscious as a mere appendix of consciousness or, to put it more drastically, a dustbin which collects all the refuse of the conscious mind—all things discarded, disused, worthless, forgotten, and repressed.

[469] This opinion had to be abandoned in more recent times, since further investigation has shown that such images and associations belong to the regular structure of the unconscious and can be observed more or less everywhere, in the dreams of highly educated as well as illiterate people, of the intelligent as well as the stupid. They are in no sense dead or meaningless “remnants”; on the contrary, they still continue to function and are therefore of vital value just because of their “historical” nature. They are a sort of language that acts as a bridge between the way in which we consciously express our thoughts and a more primitive, more colourful and pictorial from of expression—a language that appeals directly to feeling and emotion. Such a language is needed to translate certain truths from their “cultural” form (where they are utterly ineffectual) into a form that hits the nail on the head. For instance, there

is a lady well known for her stupid prejudices and stubborn arguments. The doctor tries in vain to instil some insight. He says: “My dear lady, your views are indeed very interesting and original. But you see, there are many people who unfortunately lack your assumptions and have need of your forbearance. Couldn’t you …” etc. He could just as well talk to a stone. But the dream follows a different method. She dreams: there is a great social affair to which she is invited. She is received by her hostess (a very bright woman) at the door with the words: “Oh, how nice that you have come, all your friends are already here and are expecting you.” She leads her to a door, opens it, and the lady steps into—a cowshed.

[470] This is a more concrete and drastic language, simple enough to be understood even by a blockhead. Although the lady would not admit the point of the dream, it nevertheless went home, and after a time she was forced to accept it because she could not help seeing the self-inflicted joke.

[471] The message of the unconscious is of greater importance than most people realize. As consciousness is exposed to all sorts of external attractions and distractions, it is easily led astray and seduced into following ways that are unsuited to its individuality. The general function of dreams is to balance such disturbances in the mental equilibrium by producing contents of a complementary or compensatory kind. Dreams of high vertiginous places, balloons, aeroplanes, flying and falling, often accompany states of consciousness characterized by fictitious assumptions, overestimation of oneself, unrealistic opinions, and grandiose plans. If the warning of the dream is not heeded, real accidents take its place. One stumbles, falls downstairs, runs into a car, etc. I remember the case of a man who was inextricably involved in a number of shady affairs. He developed an almost morbid passion for dangerous mountain-climbing as a sort of compensation: he was trying to “get above himself.” In one dream he saw himself stepping off the summit of a high mountain into the air. When he told me his dream, I instantly saw the risk he was running, and I tried my best to emphasize the warning and convince him of the need to restrain himself. I even told him that the dream meant his death in a mountain accident. It was in vain. Six months later he “stepped off into the air.” A mountain guide watched him and a

young friend letting themselves down on a rope in a difficult place. The friend had found a temporary foothold on a ledge, and the dreamer was following him down. Suddenly he let go of the rope "as if he were jumping into the air," as the guide reported afterwards. He fell on his friend, and both went down and were killed.

[472] Another typical case was that of a lady who was living above herself in a fantasy of distinction and austerity. But she had shocking dreams, reminding her of all sorts of unsavoury things. When I put my finger on them, she indignantly refused to acknowledge them. The dreams then became menacing, full of references to the long lonely walks she took in the woods near the town, where she indulged in soulful musings. I saw the danger and warned her insistently, but she would not listen. A week later a sexual pervert attacked her murderously, and only in the nick of time was she rescued by some people who had heard her screams. Obviously she had a secret longing for some such adventure and preferred to pay the price of two broken ribs and the fracture of a laryngeal cartilage, just as the mountain climber at least had the satisfaction of finding a definite way out of his predicament.

[473] Dreams prepare, announce, or warn about certain situations, often long before they actually happen. This is not necessarily a miracle or a precognition. Most crises or dangerous situations have a long incubation, only the conscious mind is not aware of it. Dreams can betray the secret. They often do, but just as often, it seems, they do not. Therefore our assumption of a benevolent hand restraining us in time is doubtful. Or, to put it more positively, it seems that a benevolent agency is at work sometimes but at other times not. The mysterious finger may even point the way to perdition. One cannot afford to be naïve in dealing with dreams. They originate in a spirit that is not quite human, but is rather the breath of nature—of the beautiful and generous as well as the cruel goddess. If we want to characterize this spirit, we would do better to turn to the ancient mythologies and the fables of the primeval forest. Civilization is a most expensive process and its acquisitions have been paid for by enormous losses, the extent of which we have largely forgotten or have never appreciated.

[474] Through our efforts to understand dreams we become acquainted with what Wllliam James has aptly called the "fringe of consciousness." What appear to be redundant and unwelcome accessories are, if studied more closely, the almost invisible roots of conscious contents, i.e., their subliminal aspects. They form the psychic material that must be considered as the intermediary between unconscious and conscious contents, or the bridge that spans the gap between consciousness and the ultimately physiological foundations of the psyche. The practical importance of such a bridge can hardly be overrated. It is the indispensable link between the rational world of consciousness and the world of instinct. The more our consciousness is influenced by prejudices, fantasies, infantile wishes, and the lure of external objects, the more the already existing gap will widen out into a neurotic dissociation and lead to an artificial life far removed from healthy instincts, nature, and truth. Dreams try to re-establish the equilibrium by restoring the images and emotions that express the state of the unconscious. One can hardly ever restore the original condition by rational talk, which is far too flat and colourless. But, as my examples have shown, the language of dreams provides just those images which appeal to the deeper strata of the psyche. One could even say that the interpretation of dreams enriches consciousness to such an extent that it re-learns the forgotten language of the instincts.

[475] In so far as instincts are physiological urges, they are perceived by the senses and at the same time manifest themselves as fantasies. But in so far as they are not perceived sensually, they reveal their presence only in images. The vast majority of instinctive phenomena consists, however, of images, many of which are of a symbolic nature whose meaning is not immediately recognizable. One finds them chiefly in that twilight realm between dim consciousness and the unconscious background of the dream. Sometimes a dream is of such vital importance that its message reaches consciousness no matter how uncomfortable or shocking it may be. From the standpoint of mental equilibrium and physiological health in general, it is much better for the conscious and the unconscious to be connected and to move on parallel lines than for them to be dissociated.

In this respect the production of symbols can be considered a most valuable function.

[476] One will naturally ask what is the point of this function if its symbols should pass unnoticed or prove to be incomprehensible? But lack of conscious understanding does not mean that the dream has no effect at all. Even civilized man can occasionally observe that a dream which he cannot remember can slightly alter his mood for better or worse. Dreams can be “understood” to a certain extent in a subliminal way, and that is mostly how they work. Only when a dream is very impressive, or repeats itself often, do interpretation and conscious understanding become desirable. But in pathological cases an interpretation is imperative and should be undertaken if there are no counter-indications, such as the existence of a latent psychosis, which is, as it were, only waiting for a suitable releasing agent to burst forth in full force. Unintelligent and incompetent application of dream analysis and interpretation is indeed not advisable, and particularly not when there is a dissociation between a very onesided consciousness and a correspondingly irrational or “crazy” unconscious.

[477] Owing to the infinite variety of conscious contents and their deviation from the ideal middle line, the unconscious compensation is equally varied, so that one would be hard put to it to say whether dreams and their symbols are classifiable or not. Though there are dreams and occasional symbols—better called motifs in this case—which are typical and occur often, most dreams are individual and atypical. Typical motifs are falling, flying, being chased by dangerous animals or men being insufficiently or absurdly clothed in public places, being in a hurry or lost in a milling crowd, fighting with useless weapons or being utterly defenceless, running and getting nowhere, and so on. A typical infantile motif is the dream of growing infinitely small or infinitely big, or of being transformed from the one into the other.

[478] A noteworthy phenomenon is the recurrent dream. There are cases of dreams repeating themselves from the days of childhood to the advanced years of adult life. Such dreams usually compensate a defect in one’s conscious attitude, or they date from a traumatic moment that has left behind some specific prejudice, or they anticipate a future event of some

importance. I myself dreamt of a motif that was repeated many times over a period of years. It was that I discovered a part of a wing of my house which I did not know existed. Sometimes it was the place where my parents lived—who had died long ago—where my father, to my great surprise, had a laboratory in which he studied the comparative anatomy of fishes, and where my mother ran a hostelry for ghostly visitors. Usually the wing or independent guest-house was an historical building several hundred years old, long forgotten, yet my ancestral property. It contained interesting old furniture, and towards the end of this series of recurrent dreams I discovered an old library whose books were unknown to me. Finally, in the last dream, I opened one of the old volumes and found in it a profusion of the most marvellous symbolic pictures. When I awoke, my heart was pounding with excitement.

[479] Some time before this dream I had placed an order with an antiquarian bookseller abroad for one of the Latin alchemical classics, because I had come across a quotation that I thought might be connected with early Byzantine alchemy, and I wished to verify it. Several weeks after my dream a parcel arrived containing a parchment volume of the sixteenth century with many most fascinating symbolic pictures. They instantly reminded me of my dream library. As the rediscovery of alchemy forms an important part of my life as a pioneer of psychology, the motif of the unknown annex of my house can easily be understood as an anticipation of a new field of interest and research. At all events, from that moment thirty years ago the recurrent dream came to an end.

[480] Symbols, like dreams, are natural products, but they do not occur only in dreams. They can appear in any number of psychic manifestations: there are symbolic thoughts and feelings, symbolic acts and situations, and it often looks as if not only the unconscious but even inanimate objects were concurring in the arrangement of symbolic patterns. There are numerous well-authenticated stories of a clock that stopped at the moment of its owner’s death, like Frederick the Great’s pendulum clock at Sans Souci; of a mirror that broke, or a boiling coffee-pot that exploded, just before or during a crisis; and so on. Even if the sceptic refuses to credit such reports, stories of this kind are ever renewed

and are told again and again, which is ample proof of their psychological importance, even though ignorant people deny their factual existence.

[481] The most important symbols, however, are not individual but collective in their nature and origin. They are found principally in the religions. The believer assumes that they are of divine origin—that they are revealed. The sceptic thinks they are invented. Both are wrong. It is true that, on the one hand, such symbols have for centuries been the objects of careful and quite conscious elaboration and differentiation, as in the case of dogmas. But, on the other hand, they are *représentations collectives* dating from dim and remote ages, and these are "revelations" only in the sense that they are images originating in dreams and creative fantasies. The latter are involuntary, spontaneous manifestations and by no means arbitrary and intentional inventions.

[482] There was never a genius who sat down with his pen or brush and said: "Now I am going to invent a symbol." No one can take a more or less rational thought, reached as a logical conclusion or deliberately chosen, and then disguise it as a "symbolic" phantasmagoria. No matter how fantastic the trappings may look, it would still be a *sign* hinting at a conscious thought, and not a symbol. A sign is always less than the thing it points to, and a symbol is always more than we can understand at first sight. Therefore we never stop at the sign but go on to the goal it indicates; but we remain with the symbol because it promises more than it reveals.

[483] If the contents of dreams agree with a sex theory, then we know their essence already, but if they are symbolic we at least know that we do not understand them yet. *A symbol does not disguise, it reveals in time*. It is obvious that dream interpretation will yield one result when you consider the dream to be symbolic, and an entirely different one when you assume that the essential thought is merely disguised but already known in principle. In the latter case, dream interpretation makes no sense whatever, for you find only what you know already. Therefore I always advise my pupils: "Learn as much as you can about symbolism and forget it all when you are analysing a dream." This advice is so important in practice that I myself have made it a rule to admit that I never understand a dream well enough to interpret it correctly. I do this in order to check

the flow of my own associations and reactions, which might otherwise prevail over my patient's uncertainties and hesitations. As it is of the highest therapeutic importance for the analyst to get the message of the dream as accurately as possible, it is essential for him to explore the context of the dream-images with the utmost thoroughness. I had a dream while I was working with Freud that illustrates this very clearly.

[484] I dreamt that I was in "my house," apparently on the first floor, in a cosy, pleasant drawing-room furnished in the style of the eighteenth century. I was rather astonished because I realized I had never seen this room before, and began to wonder what the ground floor was like. I went downstairs and found it rather dark, with panelled walls and heavy furniture dating from the sixteenth century or even earlier. I was greatly surprised and my curiosity increased, because it was all a very unexpected discovery. In order to become better acquainted with the whole structure of the house, I thought I would go down to the cellar. I found a door, with a flight of stone steps that led down to a large vaulted room. The floor consisted of large slabs of stone, and the walls struck me as very ancient. I examined the mortar and found it was mixed with splinters of brick. Obviously it was an old Roman wall. I began to grow excited. In a corner, I saw an iron ring in one of the stone slabs. I lifted it up and saw yet another narrow flight of steps leading down to a sort of cave which was obviously a prehistoric tomb. It contained two skulls, some bones, and broken shards of pottery. Then I woke up.

[485] If Freud, when analysing this dream, had followed my method of exploring the context, he would have heard a far-reaching story. But I am afraid he would have dismissed it as a mere attempt to escape from a problem that was really his own. The dream is in fact a short summary of my life—the life of my mind. I grew up in a house two hundred years old, our furniture consisted mostly of pieces about a hundred years old, and mentally my greatest adventure had been the study of Kant and Schopenhauer. The great news of the day was the work of Charles Darwin. Shortly before this I had been living in a still medieval world with my parents, where the world and man were still presided over by divine omnipotence and providence. This world had become antiquated and obsolete. My Christian faith had been relativized by my encounter

with Eastern religions and Greek philosophy. It is for this reason that the ground floor was so still, dark, and obviously uninhabited.

[486] My then historical interests had developed from my original preoccupation with comparative anatomy and paleontology when I worked as an assistant at the Anatomical Institute. I was fascinated by the bones of fossil man, particularly by the much-discussed *Neanderthalensis* and the still more controversial skull of Dubois' *Pithecanthropus*. As a matter of fact, these were my real associations to the dream. But I did not dare mention the subject of skulls, skeletons, or corpses to Freud, because I had learned that this theme was not popular with him. He cherished the peculiar idea that I anticipated his early death. He drew this conclusion from the fact that I was interested in the mummified corpses in the so-called Bleikeller in Bremen, which we had visited together in 1909 on our trip to America.[1]

[487] Thus I was reluctant to come out with my thoughts, since through recent experience I was deeply impressed by the almost unbridgeable gap between Freud's mental outlook and background and my own. I was afraid of losing his friendship if I should open up to him about my inner world, which, I surmised, would look very queer to him. Feeling quite uncertain about my own psychology, I almost automatically told him a lie about my "free associations" in order to escape the impossible task of enlightening him about my very personal and utterly different mental constitution.

[488] I soon realized that Freud was seeking for some incompatible wish of mine. And so I suggested tentatively that the skulls might refer to certain members of my family whose death, for some reason, I might desire. This proposal met with his approval, but I was not satisfied with such a "phoney" solution.

[489] While I was trying to find a suitable answer to Freud's questions, I was suddenly confounded by an intuition about the role which the subjective factor plays in psychological understanding. My intuition was so overwhelming that my only thought was how to get out of this impossible snarl, and I took the easy way out by a lie. This was neither elegant nor morally defensible, but otherwise I should have risked a fatal row with Freud—and I did not feel up to that for many reasons.

[490] My intuition consisted in a sudden and most unexpected insight into the fact that my dream meant myself, *my* life and *my* world, my whole reality as against a theoretical structure erected by another, alien mind for reasons and purposes of its own. It was not Freud's dream, it was mine; and suddenly I understood in a flash what my dream meant.

[491] I must apologize for this rather lengthy narration of the jam I got into through telling Freud my dream. But it is a good example of the difficulties in which one gets involved in the course of a real dream analysis. So much depends on the personal differences between the analyst and the analysand.

[492] Dream analysis on this level is less a technique than a dialectical process between two personalities. If it is handled as a technique, the peculiarity of the subject as an individual is excluded and the therapeutic problem is reduced to the simple question: who will dominate whom? I had given up hypnotic treatment for this very reason, because I did not want to impose my will on others. I wanted the healing processes to grow out of the patient's own personality, and not out of suggestions of mine that would have only a passing effect. I wanted to protect and preserve my patient's dignity and freedom so that he could live his life by his own volition.

[493] I could not share Freud's almost exclusive interest in sex. Assuredly sex plays no small role among human motives, but in many cases it is secondary to hunger, the power drive, ambition, fanaticism, envy, revenge, or the devouring passion of the creative impulse and the religious spirit.

[494] For the first time it dawned on me that before we construct general theories about man and his psyche we should learn a great deal more about the real human being, rather than an abstract idea of *Homo sapiens.*

4. THE PROBLEM OF TYPES IN DREAM INTERPRETATION

[495] In all other branches of science, it is a legitimate procedure to apply an hypothesis to an impersonal object. Psychology, however, inescapably confronts us with the living relationship between two individuals, neither of whom can be divested of his subjectivity or depersonalized in any way. They can mutually agree to deal with a chosen theme in an impersonal, objective manner, but when the whole of the personality becomes the object of their discussion, two individual subjects confront one another and the application of a one-way rule is excluded. Progress is possible only if mutual agreement can be reached. The objectivity of the final result can be established only by comparison with the standards that are generally valid in the social milieu to which the individuals belong, and we must also take their own mental equilibrium, or "sanity," into account. This does not mean that the final result must be the complete collectivization of the individual, for this would be a most unnatural condition. On the contrary, a sane and normal society is one in which people habitually disagree. General agreement is relatively rare outside the sphere of the instinctive qualities. Disagreement functions as a vehicle of mental life in a society, but it is not a goal; agreement is equally important. Because psychology basically depends upon balanced opposites, no judgment can be considered final unless allowance is made for its reversibility. The reason for this peculiarity lies in the fact that there is no standpoint above or outside psychology that would enable us to form a final judgment as to what the psyche is. Everything we can imagine is in a psychic state, i.e., in the state of a conscious representation. To get outside this is the whole difficulty of the physical sciences.

[496] In spite of the fact that the only reality is the individual, some generalities are necessary in order to clarify and classify the empirical material, for it would obviously be impossible to formulate any psychological theory, or to teach it, by describing individuals. As a principle of classification, one can choose any likeness or unlikeness if

only it is general enough, be it anatomical, physiological, or psychological. For our purpose, which is mainly concerned with psychology, it will be a psychological one, namely the widespread and easily observable fact that a great number of people are *extraverted* and others *introverted*. There is no need for a special explanation of these terms as they have passed into common speech.

[497] This is one of the many generalities from which one can choose, and it is fairly suitable for our purpose in so far as we are seeking to describe the method of, and approach to, an understanding of dreams as the main source of natural symbols. As I have said, the process of interpretation consists in the confrontation of two minds, the analyst's and the analysand's, and not in the application of a preconceived theory. The analyst's mind is characterized by a number of individual peculiarities, perhaps just as many as the analysand's. They have the effect of prejudices. It cannot be assumed that the analyst is a superman just because he is a doctor and possesses a theory and a corresponding technique. He can only imagine himself to be superior if he assumes that his theory and technique are absolute truths, capable of embracing the whole of the psyche. Since such an assumption is more than doubtful, he cannot really be sure of it. Consequently he will be assailed by secret doubts in adopting such an attitude, i.e., in confronting the human wholeness of the analysand with a theory and a technique (which are mere hypotheses) instead of with his own living wholeness. This alone is the equivalent of his analysand's personality. Psychological experience and knowledge are nothing more than professional advantages on the part of the analyst that do not keep him safely outside the fray. He will be tested just as much as the analysand.

[498] Since the systematic analysis of dreams demands the confrontation of two individuals, it will make a great difference whether their type of attitude is the same or not. If both belong to the same type, they may sail along happily for a long time. But if one is an extravert and the other an introvert, their different and contradictory standpoints may clash right away, particularly when they are unconscious of their own type or are convinced that it is the only right one. Such a mistake is easily made, because the value of the one is the non-value of the other. The one will

choose the majority view, the other will reject it just because it is everybody’s taste. Freud himself interpreted the introverted type as an individual morbidly engrossed in himself. But introspection and self-knowledge can just as well be of the greatest value.

[499] The apparently trifling difference between the extravert, with his emphasis on externals, and the introvert, who puts the emphasis on the way he takes a situation, plays a very great role in the analysis of dreams. From the start you must bear in mind that what the one appreciates may be very negative to the other, and the high ideal of the one can be an object of repulsion to the other. This becomes more and more obvious the further you go into the details of type differences. Extraversion and introversion are just two among many peculiarities of human behaviour, but they are often rather obvious and easily recognizable. If one studies extraverted individuals, for instance, one soon discovers that they differ from one another in many ways, and that being extraverted is a superficial and too general criterion to be really characteristic. That is why, long ago, I tried to find some further basic peculiarities that might serve the purpose of getting some order into the apparently limitless variations of human personality.

[500] I had always been impressed by the fact that there are surprisingly many individuals who never use their minds if they can avoid it, and yet are not stupid, and an equal number who obviously do use their minds but in an amazingly stupid way. I was also surprised to find many intelligent and wide-awake people who lived (as far as one could make out) as if they had never learned to use their sense organs. They did not see the things before their eyes, hear the words sounding in their ears, notice the things they touched or tasted, and lived without being aware of their own bodies. There were others who seemed to live in a most curious condition of consciousness, as if the state they had arrived at today were final, with no change in sight, or as if the world and the psyche were static and would remain so for ever. They seemed devoid of all imagination, and entirely and exclusively dependent on sense perception. Chances and possibilities did not exist in their world, and in their “today” there was no real “tomorrow.” The future was just the repetition of the past.

[501] What I am trying to convey to the reader is the first glimpse of the impressions I received when I began to observe the many people I met. It soon became clear to me that the people who used their minds were those who *thought*, who employed their intellectual faculty in trying to adapt to people and circumstances; and that the equally intelligent people, who yet did not think, were those who sought and found their way by *feeling*. Now "feeling" is a word that needs some explanation. For instance, one speaks of "feeling" when it is a matter of "sentiment" (corresponding to the French *sentiment*). But one also applies the same word to an opinion; a communication from the White House may begin: "The President feels …" Or one uses it to express an intuition: "I had a feeling …" Finally, feeling is often confused with sensation.

[502] What I mean by feeling in contrast to thinking is a *judgment of value:* agreeable or disagreeable, good or bad, and so on. Feeling so defined is not an emotion or affect, which is, as the words convey, an involuntary manifestation. Feeling as I mean it is a judgment without any of the obvious bodily reactions that characterize an emotion. Like thinking, it is a *rational* function; whereas intuition, like sensation, is *irrational*. In so far as intuition is a "hunch" it is not a product of a voluntary act; it is rather an involuntary event, which depends on different external or internal circumstances instead of an act of judgment. Intuition is more like sense perception, which is also an irrational event in so far as it depends essentially on external or internal stimuli deriving from physical and not mental causes.

[503] These four functional types correspond to the obvious means by which consciousness obtains its orientation. *Sensation* (or sense perception) tells you that something exists; *thinking* tells you what it is; *feeling* tells you whether it is agreeable or not; and *intuition* tells you where it comes from and where it is going.

[504] The reader should understand that these four criteria are just so many viewpoints among others, such as will-power, temperament, imagination, memory, morality, religiousness, etc. There is nothing dogmatic about them, nor do they claim to be the ultimate truth about psychology; but their basic nature recommends them as suitable principles of classification. Classification has little value if it does not provide a means

of orientation and a practical terminology. I find classification into types particularly helpful when I am called upon to explain parents to children or husbands to wives, and vice versa. It is also useful in understanding one's own prejudices.

[505] Thus, if you want to understand another person's dream, you have to sacrifice your own predilections and suppress your prejudices, at least for the time being. This is neither easy nor comfortable, because it means a moral effort that is not everyone's cup of tea. But, if you do not make the effort to criticize your own standpoint and to admit its relativity, you will get neither the right information about, nor sufficient insight into, your analysand's mind. As you expect at least some willingness on his part to listen to your opinion and to take it seriously, the patient must be granted the same right too. Although such a relationship is indispensable for any understanding and is therefore a self-evident necessity, one has to remind oneself again and again that in therapy it is more important for the patient to understand than for the analyst's theoretical expectations to be satisfied. The patient's resistance to the analyst is not necessarily wrong; it is rather a sign that something does not "click." Either the patient is not yet at a point where he would be able to understand, or the interpretation does not fit.

[506] In our efforts to interpret the dream symbols of another person, we are particularly hampered by an almost invincible tendency to fill the gaps in our understanding by *projection*—that is, by the assumption that what I think is also my partner's thought. This source of error can be avoided by establishing the context of the dream-images and excluding all theoretical assumptions—except for the heuristic hypothesis that dreams somehow make sense.

[507] There is no rule, let alone a law, of dream interpretation, although it does look as if the general purpose of dreams is *compensation*. At least, compensation can be said to be the most promising and most fertile hypothesis. Sometimes the manifest dream demonstrates its compensatory character from the start. For instance, a patient with no small idea of himself and his moral superiority dreamt of a drunken tramp wallowing in a ditch beside the road. The dreamer says (in the dream): "It's awful to see how low a man can fall!" It is evident that the

dream was attempting to deflate his exalted opinion of himself. But there was more to it than that. It turned out that he had a black sheep in the family, a younger brother who was a degenerate alcoholic. What the dream also revealed was that his superior attitude compensated the inferiority of his brother—and of the brother who was also himself.

[508] In another case, a lady who was proud of her intelligent understanding of psychology kept on dreaming about a certain woman whom she occasionally met in society. In real life she did not like her, thinking her vain, dishonest, and an intriguer. She wondered why she should dream of a person so unlike herself and yet, in the dream, so friendly and intimate, like a sister. The dream obviously wanted to convey the idea that she was "shadowed" by an unconscious character resembling that woman. As she had a very definite idea of herself, she was unaware of her own power-complex and her own shady motives, which had more than once led to disagreeable scenes that were always attributed to others but never to her own machinations.

[509] It is not only the shadow-side that is overlooked, disregarded and repressed; positive qualities can also be subjected to the same treatment. An instance of this would be an apparently modest, self-effacing man with winning, apologetic or deprecatory manners, who always takes a back seat though with seeming politeness he never misses an opportunity to be present. His judgment is well-informed, even competent and apparently appreciative, yet it hints at a certain higher level from which the matter in question could be dealt with in a far superior way. In his dreams he constantly meets great men such as Napoleon and Alexander the Great. His obvious inferiority complex is clearly compensated by such momentous visitors, but at the same time the dreams raise the critical question: what sort of man must I be to have such illustrious callers? In this respect, they show that the dreamer nurses a secret megalomania as an antidote to his inferiority complex. Without his knowing it, the idea of grandeur enables him to immunize himself against all influences from his surroundings; nothing penetrates his skin, and he can thus keep aloof from obligations that would be binding to other people. He does not feel in any way called upon to prove to himself or his fellows that his superior judgment is based on corresponding merits.

He is not only a bachelor, but mentally sterile as well. He only understands the art of spreading hints and whisperings about his importance, but no monument witnesses to his deeds. He plays this inane game all unconsciously, and the dreams try to bring it home to him in a curiously ambiguous way, as the old saying goes: *Ducunt volentem fata, nolentem trahunt* (the fates lead the willing, but drag the unwilling). Hobnobbing with Napoleon or being on speaking terms with Alexander the Great is just the thing a man with an inferiority complex could wish for—a wholesale confirmation of the greatness behind the scenes. It is true wish-fulfilment, which anticipates an achievement without the merits that should lead to it. But why, one will ask, can't dreams be open and direct about it, and say it clearly without subterfuges that seem to mislead in an almost cunning way?

[510] I have frequently been asked this question and I have asked it myself. I am often surprised at the tantalizing way dreams seem to evade definite information or omit the decisive point. Freud assumed the existence of a special factor, called the "censor," which was supposed to twist the dream-images and make them unrecognizable or misleading in order to deceive the dreaming consciousness about the real subject of the dream: the incompatible wish. Through the concealment of the critical point, it was supposed that the dreamer's sleep would be protected against the shock of a disagreeable reminiscence. But the dream as a guardian of sleep is an unlikely hypothesis, since dreams just as often disturb sleep.

[511] It looks rather as if, instead of an unconscious censor, consciousness, or the dreamer's approach to consciousness, had itself a blotting-out effect on the subliminal contents. Subliminality corresponds to what Janet calls *abaissement du niveau mental*. It is a lowering of the energic tension, in which psychic contents sink below the threshold and lose the qualities they possess in their conscious state. They lose their definiteness and clearness, and their relations become vaguely analogous instead of rational and comprehensible. This is a phenomenon that can be observed in all dreamlike conditions, whether due to fatigue, fever, or toxins. But as soon as their tension increases, they become less subliminal, more definite, and thus more conscious. There is no reason to believe that the *abaissement* shields incompatible wishes from discovery, although it may

incidentally happen that an incompatible wish disappears along with the vanishing consciousness. The dream, being essentially a subliminal process, cannot produce a definite thought, unless it should cease to be a dream by instantly becoming a conscious content. The dream cannot but skip all those points that are particularly important to the conscious mind. It manifests the "fringe of consciousness," like the faint glimmer of the stars during a total eclipse of the sun.

[512] Dream symbols are for the most part manifestations of a psyche that is beyond the control of consciousness. Meaning and purposefulness are not prerogatives of the conscious mind; they operate through the whole of living nature. There is no difference in principle between organic and psychic formations. As a plant produces its flower, so the psyche creates its symbols. Every dream is evidence of this process. Thus, through dreams, intuitions, impulses, and other spontaneous happenings, instinctive forces influence the activity of consciousness. Whether that influence is for better or worse depends on the actual contents of the unconscious. If it contains too many things that normally ought to be conscious, then its function becomes twisted and prejudiced; motives appear that are not based on true instincts, but owe their activity to the fact that they have been consigned to the unconscious by repression or neglect. They overlay, as it were, the normal unconscious psyche and distort its natural symbol-producing function.

[513] Therefore it is usual for psychotherapy, concerned as it is with the causes of a disturbance, to begin by eliciting from the patient a more or less voluntary confession of all the things he dislikes, is ashamed of, or fears. This is like the much older confession in the Church, which in many ways anticipated modern psychological techniques. In practice, however, the procedure is often reversed, since overpowering feelings of inferiority or a serious weakness may make it very difficult, if not impossible, for the patient to face a still deeper darkness and worthlessness. I have often found it more profitable first to give a positive outlook to the patient, a foundation on which he could stand, before we approached more painful and debilitating insights.

[514] Take as a simple example the dream of "personal exaltation," in which one has tea with the Queen of England, or is on intimate terms

with the Pope. If the dreamer is not a schizophrenic, the practical interpretation of the symbol depends very much on the state of his consciousness. If he is obviously convinced of his greatness a damper will be indicated, but if it is a matter of a worm already crushed by the weight of his inferiority, a further lowering of his values would amount to cruelty. In the former case a reductive treatment will recommend itself, and it will be easy to show from the associative material how inappropriate and childish the dreamer's intentions are, and how much they emanate from infantile wishes to be equal or superior to his parents. But in the latter case, where an all-pervading feeling of worthlessness has already devalued every positive aspect, to show the dreamer, on top of it all, how infantile, ridiculous, or even perverse he is would be quite unfitting. Such a procedure would only increase his inferiority, as well as cause an unwelcome and quite unnecessary resistance to the treatment.

[515] There is no therapeutic technique or doctrine that is generally applicable, since every case that comes for treatment is an individual in a specific condition. I remember a patient I had to treat over a period of nine years. I saw him only for a few weeks each year, as he lived abroad. From the start I knew what his real trouble was, but I also saw how the least attempt to get closer to the truth was met by a violent reaction and a self-defence that threatened complete rupture between us. Whether I liked it or not, I had to do my best to maintain the rapport and to follow his inclination, supported by his dreams, though this led the discussion away from the central problem that, according to all reasonable expectations, should have been discussed. It went so far that I often accused myself of leading my patient astray, and only the fact that his condition slowly but clearly improved prevented me from confronting him brutally with the truth.

[516] In the tenth year, however, the patient declared himself cured and freed from all symptoms. I was surprised and ready to doubt his statement, because theoretically he could not be cured. Noticing my astonishment, he smiled and said: "And now I want to thank you quite particularly for your unfailing tact and patience in helping me to circumvent the painful cause of my neurosis. I am now ready to tell you everything about it. If I had been able to do so I would have told you

right out at the first consultation. But that would have destroyed my rapport with you, and where would I have been then? I would have been morally bankrupt and would have lost the ground from under my feet, having nothing to stand on. In the course of the years I have learnt to trust you, and as my confidence grew my condition improved. I improved because my belief in myself was restored, and now I am strong enough to discuss the problem that was destroying me.”

[517] He then made a devastatingly frank confession, which showed me the reasons for the peculiar course our treatment had followed. The original shock had been such that he could not face it alone. It needed the two of us, and that was the therapeutic task, not the fulfilment of theoretical presuppositions.

[518] From cases like this I learnt to follow the lines already indicated in the material presented by the patient and in his disposition, rather than commit myself to general theoretical considerations that might not be applicable to that particular case. The practical knowledge of human nature I have accumulated in the course of sixty years has taught me to regard each case as a new experience, for which, first of all, I have to seek the individual approach. Sometimes I have not hesitated to plunge into a careful study of infantile events and fantasies; at other times I have begun at the top, even if this meant soaring into a mist of most unlikely metaphysical speculations. It all depends on whether I am able to learn the language of the patient and to follow the gropings of his unconscious towards the light. Some demand one thing and some another. Such are the differences between individuals.

[519] This is eminently true of the interpretation of symbols. Two different individuals can have almost the same dream, yet if one is young and the other old, the problems disturbing them will be correspondingly different, and it would be absurd to interpret both dreams in the same way. An example that comes to mind is a dream in which a company of young men are riding on horseback across a wide field. The dreamer is in the lead and jumps a ditch of water, just clearing it. The others fall into the ditch. The young man who told me this dream was a cautious, introverted type and rather afraid of adventure. But the old man, who also had this dream, was bold and fearless, and had lived an active and enterprising

life. At the time of the dream, he was an invalid who would not settle down, gave much trouble to his doctor and nurse, and had injured himself by his disobedience and restlessness. Obviously the dream was telling the young man what he *ought* to do, and the old man what he was *still doing*. While it encouraged the hesitant young man, the old one would be only too glad to risk the jump. But that still-flickering spirit of adventure was just his greatest trouble.

[520] This example shows how the interpretation of dreams and symbols depends largely on the individual disposition of the dreamer. Symbols have not one meaning only but several, and often they even characterize a pair of opposites, as does, for instance, the *stella matutina*, the morning star, which is a well-known symbol of Christ and at the same time of the devil (Lucifer). The same applies to the lion. The correct interpretation depends on the context, i.e., the associations connected with the image, and on the actual condition of the dreamer's mind.

5. THE ARCHETYPE IN DREAM SYMBOLISM

[521] The hypothesis we have advanced, that dreams serve the purpose of *compensation*, is a very broad and comprehensive assumption. It means that we believe the dream to be a normal psychic phenomenon that transmits unconscious reactions or spontaneous impulses to the conscious mind. Since only a small minority of dreams are manifestly compensatory, we must pay particular attention to the language of dreams that we consider to be symbolic. The study of this language is almost a science in itself. It has, as we have seen, an infinite variety of individual expressions. They can be read with the help of the dreamer, who himself provides the associative material, or context of the dream-image, so that we can look at all its aspects as if circumambulating it. This method proves to be sufficient in all ordinary cases, such as when a relative, a friend, or a patient tells you a dream more or less conversationally. But when it is a matter of outstanding dreams of obsessive or recurrent dreams, or dreams that are highly emotional, the personal associations produced by the dreamer no longer suffice for a satisfactory interpretation. In such cases, we have to take into consideration the fact, already observed and commented on by Freud, that elements often occur in a dream that are not individual and cannot be derived from personal experience. They are what Freud called "archaic remnants"—thought-forms whose presence cannot be explained by anything in the individual's own life, but seem to be aboriginal, innate, and inherited patterns of the human mind.

[522] Just as the human body represents a whole museum of organs, with a long evolutionary history behind them, so we should expect the mind to be organized in a similar way rather than to be a product without history. By "history" I do not mean the fact that the mind builds itself up through conscious tradition (language, etc.), but rather its biological, prehistoric, and unconscious development beginning with archaic man, whose psyche was still similar to that of an animal. This immensely old psyche forms the basis of our mind, just as the structure of our body is erected upon a

generally mammalian anatomy. Wherever the trained eye of the morphologist looks, it recognizes traces of the original pattern. Similarly, the experienced investigator of the psyche cannot help seeing the analogies between dream-images and the products of the primitive mind, its *représentations collectives*, or mythological motifs. But just as the morphologist needs the science of comparative anatomy, so the psychologist cannot do without a "comparative anatomy of the psyche." He must have a sufficient experience of dreams and other products of the unconscious on the one hand, and on the other of mythology in its widest sense. He cannot even see the analogy between a case of compulsion neurosis, schizophrenia, or hysteria and that of a classical demonic possession if he has not sufficient knowledge of both.

[523] My views about the "archaic remnants," which I have called "archetypes" [1] or "primordial images," are constantly criticized by people who lack a sufficient knowledge both of the psychology of dreams and of mythology. The term "archetype" is often misunderstood as meaning a certain definite mythological image or motif. But this would be no more than a conscious representation, and it would be absurd to assume that such variable representations could be inherited. The archetype is, on the contrary, an inherited *tendency of the humman* mind to form representations”of mythological motifs—representations that vary a great deal without losing their basic pattern. There are, for instance, numerous representations of the motif of the hostile brothers, but the motif remains the same. This inherited tendency is instinctive, like the specific impulse of nest-building, migration, etc. in birds. One finds these *représentations collectives* practically everywhere, characterized by the same or similar motifs. They cannot be assigned to any particular time or region or race. They are without known origin, and they can reproduce themselves even where transmission through migration must be ruled out.

[524] My critics have also incorrectly assumed that by archetypes I mean "inherited ideas," and on this ground have dismissed the concept of the archetype as a mere superstition. But if archetypes were ideas that originated in our conscious mind or were acquired by it, one would certainly understand them, and would not be astonished and bewildered when they appear in consciousness. I can remember many cases of

people who have consulted me because they were baffled by their own or their children’s dreams. The reason was that the dreams contained images that could not be traced to anything they remembered, and they could not explain where their children could have picked up such strange and incomprehensible ideas. These people were highly educated persons, sometimes psychiatrists themselves. One of them was a professor who had a sudden vision and thought he was crazy. He came to me in a state of complete panic. I simply took a four-hundred-year-old volume from the shelf and showed him an old woodcut that depicted his vision. “You don’t need to be crazy,” I told him. “They knew all about your vision four hundred years ago.” Whereupon he sat down entirely deflated but once more normal.

[525] I particularly remember the case of a man who was himself a psychiatrist. He brought me a handwritten booklet he had received as a Christmas present from his ten-year-old daughter. It contained a whole series of dreams she had had when she was eight years old. It was the weirdest series I had ever seen, and I could well understand why her father was more than puzzled by the dreams. Childlike though they were, they were a bit uncanny, containing images whose origin was wholly incomprehensible to her father. Here are the salient motifs from the dreams:[2]

1. The “bad animal”: a snakelike monster with many horns, that kills and devours all other animals. But God comes from the four corners, being really four gods, and gives rebirth to all the animals.

2. Ascent into heaven where pagan dances are being celebrated, and descent to hell where angels are doing good deeds.

3. A horde of small animals frightens the dreamer. The animals grow to enormous size, and one of them devours her.

4. A small mouse is penetrated by worms, snakes, fishes, and human beings. Thus the mouse becomes human. This is the origin of mankind in four stages.

5. A drop of water is looked at through a microscope: it is full of branches. This is the origin of the world.

6. A bad boy with a clod of earth. He throws bits of it at the passers-by, and they all become bad too.

7. A drunken woman falls into the water and comes out sober and renewed.

8. In America many people are rolling in an ant heap, attacked by the ants. The dreamer, in a panic, falls into a river.

9. The dreamer is in a desert on the moon. She sinks so deep into the ground that she reaches hell.

10. She touches a luminous ball seen in a vision. Vapours come out of it. Then a man comes and kills her.

11. She is dangerously ill. Suddenly birds come out of her skin and cover her completely.

12. Swarms of gnats hide the sun, moon, and stars, all except one star which then falls on the dreamer.

[526] In the unabridged German original, each dream begins with the words of the fairytale: “Once upon a time …” With these words the little dreamer suggests that she feels as if each dream were a sort of fairytale, which she wants to tell her father as a Christmas present. Her father was unable to elucidate the dreams through their context, for there seemed to be no personal associations. Indeed, this kind of childhood dream often seems to be a “Just So Story,” with very few or no spontaneous associations. The possibility that these dreams were conscious elaborations can of course be ruled out only by someone who had an intimate knowledge of the child’s character and did not doubt her truthfulness. They would, however, remain a challenge to our understanding even if they were fantasies that originated in the waking state. The father was convinced that they were authentic, and I have no reason to doubt it. I knew the little girl myself, but this was before she gave the dreams to her father, and I had no chance to question her about them, for she lived far away from Switzerland and died of an infectious disease about a year after that Christmas.

[527] The dreams have a decidedly peculiar character, for their leading thoughts are in a way like philosophical problems. The first dream, for instance, speaks of an evil monster killing all other animals, but God

gives rebirth to them through a kind of *apocatastasis*, or restitution. In the Western world this idea is known through Christian tradition. It can be found in the Acts of the Apostles 3:21: "(Christ,) whom the heaven must receive until the times of restitution of all things …" The early Greek Fathers of the Church (Origen, for instance) particularly insisted on the idea that, at the end of time, everything will be restored by the Redeemer to its original and perfect state. According to Matthew 17:11, there was already an old Jewish tradition that Elias "truly shall first come, and restore all things." I Corinthians 15:22 refers to the same idea in the following words: "For as in Adam all die, even so in Christ shall all be made alive."

[528] One might argue that the child had met with this thought in her religious education. But she had had very little of this, as her parents (Protestants) belonged to those people, common enough in our days, who know the Bible only from hearsay. It is particularly unlikely that the idea of *apocatastasis* had been explained to her, and had become a matter of vital interest. Her father, at any rate, was entirely unaware of this mythical idea.

[529] Nine of the twelve dreams are concerned with the theme of destruction and restoration. We find the same connection in I Corinthians 15:22, where Adam and Christ; i.e., death and resurrection, are linked together. None of these dreams, however, shows anything more than superficial traces of a specifically Christian education or influence. On the contrary, they show more analogy with primitive tales. This is corroborated by the other motif—the cosmogonic myth of the creation of the world and of man, which appears in dreams 4 and 5.

[530] The idea of Christ the Redeemer belongs to the world-wide and pre-Christian motif of the hero and rescuer who, although devoured by the monster, appears again in a miraculous way, having overcome the dragon or whale or whatever it was that swallowed him. How, when, and where such a motif originated nobody knows. We do not even know how to set about investigating the problem in a sound way. Our only certainty is that every generation, so far as we can see, has found it as an old tradition. Thus we can safely assume that the motif "originated" at a time when man did not yet know that he possessed a hero myth—in an age,

therefore, when he did not yet reflect consciously on what he was saying. The hero figure is a typical image, an archetype, which has existed since time immemorial.

[531] The best examples of the spontaneous production of archetypal images are presented by individuals, particularly children, who live in a milieu where one can be sufficiently certain that any direct knowledge of the tradition is out of the question. The milieu in which our little dreamer lived was acquainted only with the Christian tradition, and very superficially at that. Christian traces may be represented in her dreams by such ideas as God, angels, heaven, hell, and evil, but the way in which they are treated points to a tradition that is entirely non-Christian.

[532] Let us take the first dream, of the God who really consists of four gods, coming from the "four corners." The corners of what? There is no room mentioned in the dream. A room would not even fit in with the picture of what is obviously a cosmic event, in which the Universal Being himself intervenes. The quaternity itself is a strange idea, but one that plays a great role in Eastern religions and philosophies. In the Christian tradition it has been superseded by the Trinity, a notion that we must assume was known to the child. But who in an ordinary middleclass milieu would be likely to know of a divine quaternity? It is an idea that was once current in circles acquainted with Hermetic philosophy in the Middle Ages, but it petered out at the beginning of the eighteenth century and has been entirely obsolete for at least two hundred years. Where, then, did the little girl pick it up? From Ezekiel's vision? But there is no Christian teaching that identifies the seraphim with God.

[533] The same question may be asked about the horned serpent. In the Bible, it is true, there are many horned animals, for instance in the Book of Revelation (ch. 13). But they seem to be quadrupeds, although their overlord is the dragon, which in Greek (*drakon*) means serpent. The horned serpent appears in Latin alchemy as the *quadricornutus serpens* (four-horned serpent), a symbol of Mercurius and an antagonist of the Christian Trinity. But this is an obscure reference, and, as far as I can discover, it occurs only in one author.[3]

[534] In dream 2 a motif appears that is definitely non-Christian and a reversal of values: pagan dances by men in heaven and good deeds by

angels in hell. This suggests, if anything, a relativization of moral values. Where did the child hit on such a revolutionary and modern idea, worthy of Nietzsche's genius? Such an idea is not strange to the philosophical mind of the East, but where could we find it in the child's milieu, and what is its place in the mind of an eight-year-old girl?

[535] This question leads to a further one: what is the compensatory meaning of the dreams, to which the little girl obviously attributed so much importance that she gave them to her father as a Christmas present?

[536] If the dreamer had been a primitive medicine-man, one would not go far wrong in supposing them to be variations on the philosophical themes of death, resurrection, or restitution, the origin of the world, the creation of man, and the relativity of values (Lao-tze: "high stands on low"). One might well give up such dreams as hopeless if one tried to interpret them from a personal standpoint. But, as I have said, they undoubtedly contain *représentations collectives*, and they are in a way analogous to the doctrines taught to young people in primitive tribes when they are initiated into manhood. At such times they learn about what God or the gods or the "founding" animals have done, how the world and man were created, what the end of the world will be, and the meaning of death. And when do we, in our Christian civilization, hand out similar instructions? At the beginning of adolescence. But many people begin to think of these things again in old age, at the approach of death.

[537] Our dreamer, as it happened, was in both these situations, for she was approaching puberty and at the same time the end of her life. Little or nothing in the symbolism of the dreams points to the beginning of a normal adult life, but there are many allusions to destruction and restoration. When I first read the dreams, I had the uncanny feeling that they foreboded disaster. The reason I felt like that was the peculiar nature of the compensation that I deduced from the symbolism. It was the opposite of what one would expect to find in the consciousness of a girl of that age. These dreams open up a new and rather terrifying vision of life and death, such as one might expect in someone who looks back upon life rather than forward to its natural continuation. Their atmosphere recalls the old Roman saying, *vita somnium breve* (life is a short dream), rather than the joy and exuberance of life's springtime. For

this child, life was a *ver sacrum vovendum*, a vow of a vernal sacrifice. Experience shows that the unknown approach of death casts an *adumbratio*, an anticipatory shadow, over the life and dreams of the victim. Even the altar in our Christian churches represents, on the one hand, a tomb, and on the other a place of resurrection—the transformation of death into eternal life.

[538] Such are the thoughts that the dreams brought home to the child. They were a preparation for death, expressed through short stories, like the instruction at primitive initiations, or the *koans* of Zen Buddhism. It is an instruction that does not resemble the orthodox Christian doctrine but is more like primitive thought. It seems to have originated outside the historical tradition, in the matrix that, since prehistoric times, has nourished philosophical and religious speculations about life and death.

[539] In the case of this girl, it was as if future events were casting their shadow ahead by arousing thought-forms that, though normally dormant, are destined to describe or accompany the approach of a fatal issue. They are to be found everywhere and at all times. Although the concrete shape in which they express themselves is more or less personal, their general pattern is collective, just as animal instincts vary a good deal in different species and yet serve the same general purpose. We do not assume that each newborn animal creates its own instincts as an individual acquisition, and we cannot suppose, either, that human beings invent and produce their specifically human modes of reaction with every new birth. Like the instincts, the collective thought-patterns of the human mind are innate and inherited; and they function, when occasion arises, in more or less the same way in all of us.

[540] Emotional manifestations are based on similar patterns, and are recognizably the same all over the earth. We understand them even in animals, and the animals themselves understand each other in this respect, even if they belong to different species. And what about insects, with their complicated symbiotic functions? Most of them do not even know their parents and have nobody to teach them. Why should we suppose, then, that man is the only living creature deprived of specific instincts, or that his psyche is devoid of all traces of its evolution? Naturally, if you identify the psyche with consciousness, you can easily

succumb to the erroneous idea that the psyche is a *tabula rasa*, completely empty at birth, and that it later contains only what it has learnt by individual experience. But the psyche is more than consciousness. Animals have little consciousness, but they have many impulses and reactions that denote the existence of a psyche, and primitives do a lot of things whose meaning is unknown to them. You may ask many civilized people in vain for the reason and meaning of the Christmas tree or of the coloured eggs at Easter, because they have no idea about the meaning of these customs. The fact is, they do things without knowing why they do them. I am inclined to believe that things were generally done first and that only a long time afterwards somebody asked a question about them, and then eventually discovered why they were done. The medical psychologist is constantly confronted with otherwise intelligent patients who behave in a peculiar way and have no inkling of what they say or do. We have dreams whose meaning escapes us entirely, even though we may be firmly convinced that the dream has a definite meaning. We feel it is important or even terrifying, but why?

[541] Regular observation of such facts has enforced the hypothesis of an unconscious psyche, the contents of which seem to be of approximately the same variety as those of consciousness. We know that consciousness depends in large measure on the collaboration of the unconscious. When you make a speech, the next sentence is being prepared while you speak, but this preparation is mostly unconscious. If the unconscious does not collaborate and withholds the next sentence you are stuck. You want to quote a name, or a term otherwise familiar to you, but nothing is forthcoming. The unconscious does not deliver it. You want to introduce somebody whom you know well, but his name has vanished, as if you had never known it. Thus you depend on the goodwill of your unconscious. Any time the unconscious chooses, it can defeat your otherwise good memory, or put something into your mouth that you did not intend at all. It can produce unpredictable and unreasonable moods and affects and thus cause all sorts of complications.

[542] Superficially, such reactions and impulses seem to be of an intimately personal nature and are therefore believed to be entirely individual. In reality, they are based on a preformed and ever-ready instinctive system

with its own characteristic and universally understandable thought-forms, reflexes, attitudes, and gestures. These follow a pattern that was laid down long before there was any trace of a reflective consciousness. It is even conceivable that the latter originated in violent emotional clashes and their often disastrous consequences. Take the case of the savage who, in a moment of anger and disappointment at having caught no fish, strangles his much beloved only son, and is then seized with immeasurable regret as he holds the little dead body in his arms. Such a man has a great chance to remember the agony of this moment for ever. This could have been the beginning of a reflective consciousness. At all events, the shock of a similar emotional experience is often needed to make people wake up and pay attention to what they are doing. I would mention the famous case of the Spanish hidalgo, Ramón Lull, who after a long chase finally succeeded in meeting his lady at a secret rendezvous. Silently she opened her garment and showed him her cancer-eaten bosom. The shock changed his life: he became a holy man.

[543] Often in the case of these sudden transformations one can prove that an archetype has been at work for a long time in the unconscious, skilfully arranging circumstances that will unavoidably lead to a crisis. It is not rare for the development to manifest itself so clearly (for instance in a series of dreams) that the catastrophe can be predicted with reasonable certainty. One can conclude from experiences such as these that archetypal forms are not just static patterns, but dynamic factors that manifest themselves in spontaneous impulses, just as instincts do. Certain dreams, visions, or thoughts can suddenly appear, and in spite of careful investigation one cannot find out what causes them. This does not mean that they have no cause; they certainly have, but it is so remote or obscure that one cannot see what it is. One must wait until the dream and its meaning are sufficiently understood, or until some external event occurs that will explain the dream.

[544] Our conscious thoughts often concern themselves with the future and its possibilities, and so does the unconscious and its dreams. There has long been a world-wide belief that the chief function of dreams is prognostication of the future. In antiquity, and still in the Middle Ages, dreams played their part in medical prognosis. I can confirm from a

modern dream the prognosis, or rather precognition, in an old dream quoted by Artemidoros of Daldis, in the second century A.D. He relates that a man dreamt he saw his father die in the flames of a house on fire. Not long afterwards, he himself died of a *phlegmone* (fire, high fever), presumably pneumonia. Now it so happened that a colleague of mine was suffering from a deadly gangrenous fever—in fact, a *phlegmone*. A former patient of his, who had no knowledge of the nature of the doctor's illness, dreamt that the doctor was perishing in a great fire. The dream occurred three weeks before the doctor died, at a time when he had just entered hospital and the disease was only at its beginning. The dreamer knew nothing but the bare fact that the doctor was ill and had entered hospital.

[545] As this example shows, dreams can have an anticipatory or prognostic aspect, and their interpreter will be well advised to take this aspect into account, particularly when an obviously meaningful dream does not yield a context sufficient to explain it. Such a dream often comes right out of the blue, and one wonders what could have prompted it. Of course, if one knew its ultimate outcome, the cause would be clear. It is only our conscious mind that does not know; the unconscious seems already informed, and to have submitted the case to a careful prognostic examination, more or less in the way consciousness would have done if it had known the relevant facts. But, precisely because they were subliminal, they could be perceived by the unconscious and submitted to a sort of examination that anticipates their ultimate result. So far as one can make out from dreams, the unconscious in its "deliberations" proceeds in an instinctive way rather than along rational lines. The latter way is the prerogative of consciousness, which selects with reason and knowledge. But the unconscious is guided chiefly by instinctive trends, represented by corresponding thought-forms—the archetypes. It looks as if it were a poet who had been at work rather than a rational doctor, who would speak of infection, fever, toxins, etc., whereas the dream describes the diseased body as a man's earthly house, and the fever as the heat of a conflagration that is destroying the house and its inhabitant.

[546] As this dream shows, the archetypal mind has handled the situation in the same way as it did at the time of Artemidoros. A situation of a more

or less unknown nature has been intuitively grasped by the unconscious and submitted to an archetypal treatment. This shows clearly that, in place of the *raisonnement* which consciousness would have applied, the archetypal mind has autonomously taken over the task of prognostication. The archetypes have their own initiative and their own specific energy, which enable them not only to produce a meaningful interpretation (in their own style) but also to intervene in a given situation with their own impulses and thought-forms. In this respect they function like complexes, which also enjoy a certain autonomy in everyday life. They come and go very much as they please, and they often interfere with our conscious intentions in an embarrassing way.

[547] One can perceive the specific energy of the archetypes when one experiences the peculiar feeling of numinosity that accompanies them—the fascination or spell that emanates from them. This is also characteristic of the personal complexes, whose behaviour may be compared with the role played by the archetypal *représentations collectives* in the social life of all times. As personal complexes have their individual history, so do social complexes of an archetypal character. But while personal complexes never produce more than a personal bias, archetypes create myths, religions, and philosophical ideas that influence and set their stamp on whole nations and epochs. And just as the products of personal complexes can be understood as compensations of onesided or faulty attitudes of consciousness, so myths of a religious nature can be interpreted as a sort of mental therapy for the sufferings of mankind, such as hunger, war, disease, old age, and death.

[548] The universal hero myth, for example, shows the picture of a powerful man or god-man who vanquishes evil in the form of dragons, serpents, monsters, demons, and enemies of all kinds, and who liberates his people from destruction and death. The narration or ritual repetition of sacred texts and ceremonies, and the worship of such a figure with dances, music, hymns, prayers, and sacrifices, grip the audience with numinous emotions and exalt the participants to identification with the hero. If we contemplate such a situation with the eyes of a believer, we can understand how the ordinary man is gripped, freed from his impotence and misery, and raised to an almost superhuman status, at least

for the time being, and often enough he is sustained by such a conviction for a long time. An initiation of this kind produces a lasting impression, and may even create an attitude that gives a certain form and style to the life of a society. I would mention as an example the Eleusinian mysteries, which were finally suppressed at the beginning of the seventh century. They formed, together with the Delphic oracle, the essence and spirit of ancient Greece. On a much greater scale the Christian era owes its name and significance to another antique mystery, that of the god-man, which has its roots in the archetypal Osiris-Horus myth of ancient Egypt.

[549] It is nowadays a common prejudice to assume that once, in an obscure prehistoric time, the basic mythological ideas were "invented" by a clever old philosopher or prophet, and ever afterwards "believed" by credulous and uncritical people, although the stories told by a power-seeking priesthood were not really "true" but mere "wishful thinking." The word "invent" is derived from the Latin *invenire* and means, in the first place, to "come upon" or to "find" something and, in the second, to find something by *seeking* for it. In the latter case, it is not a matter of finding or coming upon something by mere chance, for there is a sort of foreknowledge or a faint inkling of the thing you are going to find.

[550] When we contemplate the strange ideas in the dreams of the little girl, it seems unlikely that she *sought* them, as she was rather surprised at finding them. They occurred to her rather as strange and unexpected stories that seemed noteworthy and interesting enough to be given to her father as a Christmas present. In doing so, she lifted them up into the sphere of our still living Christian mystery, the birth of our Lord, blended with the secret of the evergreen tree that carries the newborn Light. Although there is ample historical evidence for the symbolic relationship between Christ and the tree symbol, the little girl's parents would have been badly embarrassed had they been asked to explain exactly what they meant by decorating a tree with burning candles to celebrate the nativity of Christ. "Oh, it's just a Christmas custom!" they would have said. A serious answer would require a far-reaching dissertation on the symbolism of the dying god in antiquity, in the Near East, and its relation to the cult of the Great Mother and her symbol, the tree—to mention only one aspect of this complicated problem.

[551] The further we delve into the origins of a *représentation collective* or, in ecclesiastical language, of a dogma, the more we uncover a seemingly limitless web of archetypal patterns that, before modern times, were never the object of conscious reflection. Thus, paradoxically enough, we know more about mythological symbolism than did any age before our own. The fact is that in former times men *lived* their symbols rather than reflected upon them. I will illustrate this by an experience I once had with the primitives on Mount Elgon in East Africa. Every morning at dawn they leave their huts and breathe or spit into their hands, stretching them out to the first rays of the sun, as if they were offering either their breath or their spittle to the rising god—to *mungu*. (This Swahili word, which they used in explaining the ritual act, is derived from a Polynesian root equivalent to *mana* or *mulungu*. These and similar terms designate a “power” of extraordinary efficacy, an all-pervading essence which we would call divine. Thus the word *mungu is* their equivalent for Allah or God.) When I asked them what they meant by this act and why they did it, they were completely baffled. They could only say: “We have always done it. It has always been done when the sun rises.” They laughed at the obvious conclusion that the sun is *mungu*. The sun is not *mungu* when it is above the horizon; *mungu* is the actual moment of the sunrise.

[552] What they were doing was obvious to me but not to them. They just do it, they never reflect on what they are doing, and are consequently unable to explain themselves. They are evidently just repeating what they have “always” done at sunrise, no doubt with a certain emotion and by no means merely mechanically, for they *live* it while we *reflect* on it. Thus I knew that they were offering their *souls* to *mungu*, because the breath (of life) and the spittle mean “soul substance.” Breathing or spitting on something conveys a “magical” effect, as, for instance, when Christ used spittle to heal the blind, or when a son inhales his dying father’s last breath in order to take over the father’s soul. It is most unlikely that these primitives ever, even in the remote past, knew any more about the meaning of their ceremony. On the contrary, their ancestors probably knew even less, because they were more profoundly unconscious and thought if possible even less about their doings.

[553] Faust aptly says: “Im Anfang war die Tat” (in the beginning was the deed). Deeds were never invented, they were done. Thoughts, on the other hand, are a relatively late discovery; they were found, and then they were sought and found. Yet unreflected life existed long before man; it was not invented, but in it man found himself as an afterthought. First he was moved to deeds by unconscious factors, and only a long time afterwards did he begin to reflect about the causes that had moved him; then it took him a very long time indeed to arrive at the preposterous idea that he must have moved himself—his mind being unable to see any other motivating force than his own. We would laugh at the idea of a plant or an animal inventing itself, yet there are many people who believe that the psyche or the mind invented itself and thus brought itself into being. As a matter of fact, the mind has grown to its present state of consciousness as an acorn grows into an oak or as saurians developed into mammals. As it has been, so it is still, and thus we are moved by forces from within as well as from without.

[554] In a mythological age these forces were called *mana,* spirits, demons, and gods, and they are as active today as they ever were. If they conform to our wishes, we call them happy hunches or impulses and pat ourselves on the back for being smart fellows. If they go against us, then we say it is just bad luck, or that certain people have it in for us, or it must be pathological. The one thing we refuse to admit is that we are dependent on “powers” beyond our control.

[555] It is true that civilized man has acquired a certain amount of will-power which he can apply where he pleases. We have learnt to do our work efficiently without having recourse to chanting and drumming to hypnotize us into the state of doing. We can even dispense with the daily prayer for divine aid. We can carry out what we propose to do, and it seems self-evident that an idea can be translated into action without a hitch, whereas the primitive is hampered at every step by doubts, fears, and superstitions. The motto “Where there’s a will there’s a way” is not just a Germanic prejudice; it is the superstition of modern man in general. In order to maintain his credo, he cultivates a remarkable lack of introspection. He is blind to the fact that, with all his rationality and efficiency, he is possessed by powers beyond his control. The gods and

demons have not disappeared at all, they have merely got new names. They keep him on the run with restlessness, vague apprehensions, psychological complications, an invincible need for pills, alcohol, tobacco, dietary and other hygienic systems—and above, all, with an impressive array of neuroses.

[556] I once met a drastic example of this in a professor of philosophy and "psychology"—a psychology in which the unconscious had not yet arrived. He was the man I mentioned who was obsessed by the idea that he had cancer, although X-rays had proved to him that it was all imaginary. Who or what caused this idea? It obviously derived from a fear that was not caused by observation of the facts. It suddenly overcame him and then remained. Symptoms of this kind are extraordinarily obstinate and often enough hinder the patient from getting the proper treatment. For what good would psychotherapy be in dealing with a malignant tumour? Such a dangerous thing could only be operated on without delay. To the professor's ever-renewed relief, every new authority assured him that there was no trace of cancer. But the very next day the doubt began nagging again, and he was plunged once more into the night of unmitigated fear.

[557] The morbid thought had a power of its own that he could not control. It was not foreseen in his philosophical brand of psychology, where everything flowed neatly from consciousness and sense-perception. The professor admitted that his case was pathological, but there his thinking stopped, because it had arrived at the sacrosanct border-line between the philosophical and the medical faculty. The one deals with normal and the other with abnormal contents, unknown in the philosopher's world.

[558] This compartment psychology reminds me of another case. It was that of an alcoholic who had come under the laudable influence of a certain religious movement and, fascinated by its enthusiasm, had forgotten he needed a drink. He was obviously and miraculously cured by Jesus, and accordingly was held up as a witness to divine grace or to the efficacy of the said organization. After a few weeks of public confession, the novelty began to wear off and some alcoholic refreshment seemed to be indicated. But this time the helpful organization came to the conclusion that the case was "pathological" and not suitable for an

intervention by Jesus. So they put him in a clinic to let the doctor do better than the divine healer.

[559] This is an aspect of the modern "cultural" mind that is well worth looking into. It shows an alarming degree of dissociation and psychological confusion. We believe exclusively in consciousness and free will, and are no longer aware of the powers that control us to an indefinite degree, outside the narrow domain where we can be reasonable and exercise a certain amount of free choice and self-control. In our time of general disorientation, it is necessary to know about the true state of human affairs, which depends so much on the mental and moral qualities of the individual and on the human psyche in general. But if we are to see things in their right perspective, we need to understand the past of man as well as his present. That is why a correct understanding of myths and symbols is of essential importance.

6. THE FUNCTION OF RELIGIOUS SYMBOLS

[560] Although our civilized consciousness has separated itself from the instincts, the instincts have not disappeared: they have merely lost their contact with consciousness. They are thus forced to assert themselves in an indirect way, through what Janet called automatisms. These take the form of symptoms in the case of a neurosis or, in normal cases, of incidents of various kinds, like unaccountable moods, unexpected forgetfulness, mistakes in speech, and so on. Such manifestations show very clearly the *autonomy* of the archetypes. It is easy to believe that one is master in one's own house, but as long as we are unable to control our emotions and moods, or to be conscious of the myriad secret ways in which unconscious factors insinuate themselves into our arrangements and decisions, we are certainly not the masters. On the contrary. we have so much reason for uncertainty that it will be better to look twice at what we are doing.

[561] The exploration of one's conscience, however, is not a popular pastime, although it would be most necessary, particularly in our time when man is threatened with self-created and deadly dangers that are growing beyond his control. If, for a moment, we look at mankind as one individual, we see that it is like a man carried away by unconscious powers. He is dissociated like a neurotic, with the Iron Curtain marking the line of division. Western man. representing the kind of consciousness hitherto regarded as valid, has become increasingly aware of the aggressive will to power of the East, and he sees himself forced to take extraordinary measures of defence. What he fails to see is that it is his own vices, publicly repudiated and covered up by good international manners, that are thrown back in his face through their shameless and methodical application by the East. What the West has tolerated, but only secretly, and indulged in a bit shamefacedly (the diplomatic lie, the double-cross, veiled threats), comes back openly and in full measure and gets us tied up in knots—exactly the case of the neurotic! It is the face of our own shadow that glowers at us across the Iron Curtain.

[562] This state of affairs explains the peculiar feeling of helplessness that is creeping over our Western consciousness. We are beginning to realize that the conflict is in reality a moral and mental problem, and we are trying to find some answer to it. We grow increasingly aware that the nuclear deterrent is a desperate and undesirable answer, as it cuts both ways. We know that moral and mental remedies would be more effective because they could provide us with a psychic immunity to the ever-increasing infection. But all our attempts have proved to be singularly ineffectual, and will continue to do so as long as we try to convince ourselves and the world that it is only *they*, our opponents, who are all wrong, morally and philosophically. We expect *them* to see and understand where they are wrong, instead of making a serious effort ourselves to recognize our own shadow and its nefarious doings. If we could only see our shadow, we should be immune to any moral and mental infection and insinuation. But as long as this is not so, we lay ourselves open to every infection because we are doing practically the same things as *they* are, only with the additional disadvantage that we neither see nor want to understand what we are doing under the cloak of good manners.

[563] The East has one big myth—which we call an illusion in the vain hope that our superior judgment will make it disappear. This myth is the time-hallowed archetypal dream of a Golden Age or a paradise on earth, where everything is provided for everybody, and one great, just, and wise Chief rules over a human kindergarten. This powerful archetype in its infantile form has got them all right, but it won’t disappear from the world at the mere sight of our superior point of view. We even support it by our own childishness, for our Western civilization is in the grip of the same mythology. We cherish the same prejudices, hopes, and expectations. We believe in the Welfare State, in universal peace, in more or less equality for man, in his eternal human rights, injustice and truth, and (not too loud) in the Kingdom of God on earth.

[564] The sad truth is that man’s real life consists of inexorable opposites—day and night, wellbeing and suffering, birth and death, good and evil. We are not even sure that the one will prevail against the other, that good will overcome evil, or joy defeat pain. Life and the world are a

battleground, have always been and always will be, and, if it were not so, existence would soon come to an end. It is for this reason that a superior religion like Christianity expected an early end to this world, and Buddhism actually puts an end to it by turning its back on all desires. These categorical answers would be frankly suicidal if they were not bound up with the peculiar moral ideas and practices that constitute the body of both religions.

[565] I mention this because in our time there are countless people who have lost faith in one or other of the world religions. They do not understand them any longer. While life runs smoothly, the loss remains as good as unnoticed. But when suffering comes, things change very rapidly. One seeks the way out and begins to reflect about the meaning of life and its bewildering experiences. It is significant that, according to the statistics, the psychiatrist is consulted more by Protestants and Jews than by Catholics. This might be expected, for the Catholic Church still feels responsible for the *cura animarum*, the care of souls. But in this scientific age, the psychiatrist is apt to be asked questions that once belonged to the domain of the theologian. People feel that it makes, or would make, a great difference if only they had a positive belief in a meaningful way of life or in God and immortality. The spectre of death looming up before them often gives a powerful incentive to such thoughts. From time immemorial, men have had ideas about a Supreme Being (one or several) and about the Land of the Hereafter. Only modern man thinks he can do without them. Because he cannot discover God's throne in heaven with a telescope or radar, or establish for certain that dear father or mother are still about in a more or less corporeal form, he assumes that such ideas are not "true." I would rather say that they are not "true" enough. They have accompanied human life since prehistoric times and are still ready to break through into consciousness at the slightest provocation.

[566] One even regrets the loss of such convictions. Since it is a matter of invisible and unknowable things (God is beyond human understanding, and immortality cannot be proved), why should we bother about evidence or truth? Suppose we did not know and understand the need for salt in our food, we would nevertheless profit from its use. Even if we should assume that salt is an illusion of our taste-buds, or a superstition, it would

still contribute to our wellbeing. Why, then, should we deprive ourselves of views that prove helpful in crises and give a meaning to our existence? And how do we know that such ideas are not true? Many people would agree with me if I stated flatly that such ideas are illusions. What they fail to realize is that this denial amounts to a "belief" and is just as impossible to prove as a religious assertion. We are entirely free to choose our standpoint; it will in any case be an arbitrary decision. There is, however, a strong empirical reason why we should hold beliefs that we know can never be proved. It is that they are known to be useful. Man positively needs general ideas and convictions that will give a meaning to his life and enable him to find his place in the universe. He can stand the most incredible hardships when he is convinced that they make sense; but he is crushed when, on top of all his misfortunes, he has to admit that he is taking part in a "tale told by an idiot."

[567] It is the purpose and endeavour of religious symbols to give a meaning to the life of man. The Pueblo Indians believe that they are the sons of Father Sun, and this belief gives their life a perspective and a goal beyond their individual and limited existence. It leaves ample room for the unfolding of their personality, and is infinitely more satisfactory than the certainty that one is and will remain the underdog in a department store. If St. Paul had been convinced that he was nothing but a wandering weaver of carpets, he would certainly not have been himself. His real and meaningful life lay in the certainty that he was the messenger of the Lord. You can accuse him of megalomania, but your opinion pales before the testimony of history and the *consensus omnium*. The myth that took possession of him made him something greater than a mere craftsman.

[568] Myths, however, consist of symbols that were not invented but happened. It was not the man Jesus who created the myth of the God-man; it had existed many centuries before. He himself was seized by this symbolic idea, which, as St. Mark tells us, lifted him out of the carpenter's shop and the mental narrowness of his surroundings. Myths go back to primitive story-tellers and their dreams, to men moved by the stirrings of their fantasies, who were not very different from poets and philosophers in later times. Primitive story-tellers never worried about the origin of their fantasies; it was only much later that people began to

wonder where the story came from. Already in ancient Greece they were advanced enough to surmise that the stories about the gods were nothing but old and exaggerated traditions of ancient kings and their deeds. They assumed even then that the myth did not mean what it said because it was obviously improbable. Therefore they tried to reduce it to a generally understandable yarn. This is exactly what our time has tried to do with dream symbolism: it is assumed that it does not mean what it seems to say, but something that is generally known and understood, though not openly admitted because of its inferior quality. For those who had got rid of their conventional blinkers there were no longer any riddles. It seemed certain that dreams meant something different from what they said.

[569] This assumption is wholly arbitrary. The Talmud says more aptly: "The dream is its own interpretation." Why should dreams mean something different from what appears in them? Is there anything in nature that is other than what it is? For instance, the duck-billed platypus, that original monster which no zoologist would ever have invented, is it not just what it is? The dream is a normal and natural phenomenon, which is certainly just what it is and does not mean something it is not. We call its contents symbolic because they have obviously not only one meaning, but point in different directions and must therefore mean something that is unconscious, or at least not conscious in all its aspects.

[570] To the scientific mind, such phenomena as symbolic ideas are most irritating, because they cannot be formulated in a way that satisfies our intellect and logic. They are by no means the only instance of this in psychology. The trouble begins already with the phenomenon of affect or emotion, which evades all the attempts of the psychologist to pin it down in a hard-and-fast concept. The cause of the difficulty is the same in both cases—the intervention of the unconscious. I know enough of the scientific standpoint to understand that it is most annoying to have to deal with facts that cannot be grasped completely or at any rate adequately. The trouble with both phenomena is that the facts are undeniable and yet cannot be formulated in intellectual terms. Instead of observable details with clearly discernible features, it is life itself that wells up in emotions and symbolic ideas. In many cases emotion and symbol are actually one

and the same thing. There is no intellectual formula capable of representing such a complex phenomenon in a satisfactory way.

[571] The academic psychologist is perfectly free to dismiss the emotions or the unconscious, or both, from his consideration. Yet they remain facts to which at least the medical psychologist has to pay ample attention, for emotional conflicts and the interventions of the unconscious are the classical features of his science. If he treats a patient at all, he is confronted with irrationalities of this kind whether he can formulate them intellectually or not. He has to acknowledge their only too troublesome existence. It is therefore quite natural that people who have not had the medical psychologist's experience find it difficult to follow what he is talking about. Anyone who has not had the chance, or the misfortune, to live through the same or similar experiences is hardly capable of understanding what happens when psychology ceases to be a tranquil pursuit for the scientist in his laboratory and becomes a real life adventure. Target practice on a shooting range is far from being a battlefield, but the doctor has to deal with casualties in a real war. Therefore he has to concern himself with psychic realities even if he cannot define them in scientific terms. He can name them, but he knows that all the terms he uses to designate the essentials of life do not pretend to be more than names for facts that have to be experienced in themselves, because they cannot be reproduced by their names. No textbook can teach psychology; one learns only by actual experience. No understanding is gained by memorizing words, for symbols are the living facts of life.

[572] The cross in the Christian religion, for instance, is a meaningful symbol that expresses a multitude of aspects, ideas, and emotions, but a cross before somebody's name simply indicates that that individual is dead. The *lingam* or phallus functions as an all-embracing symbol in the Hindu religion, but if a street urchin draws one on a wall, it just means an interest in his penis. Because infantile and adolescent fantasies often continue far into adult life, many dreams contain unmistakable sexual allusions. It would be absurd to understand them as anything else. But when a mason speaks of monks and nuns to be laid upon each other, or a locksmith of male and female keys, it would be nonsensical to suppose

that he is indulging in glowing adolescent fantasies. He simply means a particular kind of tile or key that has been given a colourful name. But when an educated Hindu talks to you about the *lingam,* you will hear things we Westerners would never connect with the penis. You may even find it most difficult to guess what he actually means by this term, and you will naturally conclude that the lingam *symbolizes* a good many things. It is certainly not an obscene allusion; nor is the cross a mere sign for death but a symbol for a great many other ideas. Much, therefore, depends on the maturity of the dreamer who produces such an image.

[573] The interpretation of dreams and symbols requires some intelligence. It cannot be mechanized and crammed into stupid and unimaginative brains. It demands an ever-increasing knowledge of the dreamer’s individuality as well as an ever-increasing self-awareness on the part of the interpreter. No experienced worker in this field will deny that there are rules of thumb that can prove helpful, but they must be applied with prudence and intelligence. Not everybody can master the “technique.” You may follow all the right rules and the apparently safe path of knowledge and yet you get stuck in the most appalling nonsense, simply by overlooking a seemingly unimportant detail that a better intelligence would not have missed. Even a man with a highly developed intellect can go badly astray because he has never learnt to use his intuition or his feeling, which might be at a regrettably low level of development.

[574] The attempt to understand symbols does not only bring you up against the symbol itself, but up against the wholeness of the symbol-producing individual. If one is really up to this challenge, one may meet with success. But as a rule it will be necessary to make a special study of the individual and his or her cultural background. One can learn a lot in this way and so get a chance to fill in the gaps in one’s education. I have made it a rule myself to consider every case an entirely new proposition about which I do not even know the ABC. Routine may be and often is practical, and quite useful as long as one skates on the surface, but as soon as one gets in touch with the vital problems, life itself takes over and even the most brilliant theoretical premises become ineffectual words.

[575] This makes the teaching of methods and techniques a major problem. As I have said, the pupil has to acquire a good deal of specialized knowledge. This provides him with the necessary mental tool-shop, but the main thing, the handling of the tools, can be acquired only if the pupil undergoes an analysis that acquaints him with his own conflict. This can be quite a task with some so-called normal but unimaginative individuals. They are just incapable of realizing, for instance, the simple fact that psychic events happen to us spontaneously. Such people prefer to cling to the idea that whatever occurs either is done by themselves or else is pathological and must be cured by pills or injections. They show how close dull normality is to a neurosis, and as a matter of fact such people succumb most easily to psychic epidemics.

[576] In all the higher grades of science, imagination and intuition play an increasingly important role over and above intellect and its capacity for application. Even physics, the most rigorous of all the applied sciences, depends to an astonishing degree on intuition, which works by way of the unconscious processes and not by logical deductions, although it is possible to demonstrate afterwards what logical procedure might have led to the same result.

[577] Intuition is almost indispensable in the interpretation of symbols, and can cause an immediate acceptance on the part of the dreamer. But, subjectively convincing as such a lucky hunch may be, it is also somewhat dangerous, because it leads to a false sense of security. It may even seduce both the interpreter and the dreamer into continuing this rather facile exchange of ideas, which may end in a sort of mutual dream. The secure basis of real intellectual and moral knowledge gets lost if one is satisfied with a vague feeling of having understood. Usually when one asks people the reasons for their so-called understanding, they are unable to give an explanation. One can understand and explain only when one has brought intuitions down to the safe basis of real knowledge of the facts and their logical connections. An honest investigator will have to admit that this is not possible in certain cases, but it would be dishonest of him to dismiss them on that account. Even a scientist is a human being, and it is quite natural that he, like others, hates the things he cannot explain and thus falls victim to the common illusion that what we

know today represents the highest summit of knowledge. Nothing is more vulnerable and ephemeral than scientific theories, which are mere tools and not everlasting truths.

7. HEALING THE SPLIT

[578] When the medical psychologist takes an interest in symbols, he is primarily concerned with "natural" symbols as distinct from "cultural" symbols. The former are derived from the unconscious contents of the psyche, and they therefore represent an enormous number of variations on the basic archetypal motifs. In many cases, they can be traced back to their archaic roots, i.e., to ideas and images that we meet in the most ancient records and in primitive societies. In this respect, I should like to call the reader's attention to such books as Mircea Eliade's study of shamanism,[1] where a great many illuminating examples may be found.

[579] "Cultural" symbols, on the other hand, are those that have expressed "eternal truths" or are still in use in many religions. They have gone through many transformations and even a process of more or less conscious elaboration, and in this way have become the *représentations collectives* of civilized societies. Nevertheless, they have retained much of their original numinosity, and they function as positive or negative "prejudices" with which the psychologist has to reckon very seriously.

[580] Nobody can dismiss these numinous factors on merely rational grounds. They are important constituents of our mental make-up and vital forces in the building up of human society, and they cannot be eradicated without serious loss. When they are repressed or neglected, their specific energy disappears into the unconscious with unpredictable consequences. The energy that appears to have been lost revives and intensifies whatever is uppermost in the unconscious—tendencies, perhaps, that have hitherto had no chance to express themselves, or have not been allowed an uninhibited existence in our consciousness. They form an ever-present destructive "shadow." Even tendencies that might be able to exert a beneficial influence turn into veritable demons when they are repressed. This is why many well-meaning people are understandably afraid of the unconscious, and incidentally of psychology.

[581] Our times have demonstrated what it means when the gates of the psychic underworld are thrown open. Things whose enormity nobody could have imagined in the idyllic innocence of the first decade of our century have happened and have turned the world upside down. Ever since, the world has remained in a state of schizophrenia. Not only has the great civilized Germany disgorged its primitivity, but Russia also is ruled by it, and Africa has been set on fire. No wonder the Western world feels uneasy, for it does not know how much it plays into the hands of the uproarious underworld and what it has lost through the destruction of its numinosities. It has lost its moral and spiritual values to a very dangerous degree. Its moral and spiritual tradition has collapsed, and has left a worldwide disorientation and dissociation.

[582] We could have seen long ago from primitive societies what the loss of numinosity means: they lose their *raison d’être*, the order of their social organizations, and then they dissolve and decay. We are now in the same condition. We have lost something we have never properly understood. Our spiritual leaders cannot be spared the blame for having been more interested in protecting their institutions than in understanding the mystery that symbols present. Faith does not exclude thought (which is man’s strongest weapon), but unfortunately many believers are so afraid of science, and also of psychology, that they turn a blind eye to the numinous psychic powers that forever control man’s fate. We have stripped all things of their mystery and numinosity; nothing is holy any longer.

[583] The masses and their leaders do not realize that it makes no substantial difference whether you call the world principle male and a father (spirit), or female and a mother (matter). Essentially, we know as little of the one as of the other. Since the beginning of the human mind, both were numinous symbols, and their importance lay in their numinosity and not in their sex or other chance attributes. Since energy never vanishes, the emotional energy that manifests itself in all numinous phenomena does not cease to exist when it disappears from consciousness. As I have said, it reappears in unconscious manifestations, in symbolic happenings that compensate the disturbances of the conscious psyche. Our psyche is profoundly disturbed by the loss

of moral and spiritual values that have hitherto kept our life in order. Our consciousness is no longer capable of integrating the natural afflux of concomitant, instinctive events that sustains our conscious psychic activity. This process can no longer take place in the same way as before, because our consciousness has deprived itself of the organs by which the auxiliary contributions of the instincts and the unconscious could be assimilated. These organs were the numinous symbols, held holy by common consent.

[584] A concept like "physical matter," stripped of its numinous connotation of the "Great Mother," no longer expresses the vast emotional meaning of "Mother Earth." It is a mere intellectual term, dry as dust and entirely inhuman. In the same way, "spirit" identified with "intellect" ceases to be the Father of All. It degenerates into the limited mind of man, and the immense emotional energy expressed in the image "our Father" vanishes in the sand of an intellectual desert.

[585] Through scientific understanding, our world has become dehumanized. Man feels himself isolated in the cosmos. He is no longer involved in nature and has lost his emotional participation in natural events, which hitherto had a symbolic meaning for him. Thunder is no longer the voice of a god, nor is lightning his avenging missile. No river contains a spirit, no tree means a man's life, no snake is the embodiment of wisdom, and no mountain still harbours a great demon. Neither do things speak to him nor can he speak to things, like stones, springs, plants, and animals. He no longer has a bush-soul identifying him with a wild animal. His immediate communication with nature is gone for ever, and the emotional energy it generated has sunk into the unconscious.

[586] This enormous loss is compensated by the symbols in our dreams. They bring up our original nature, its instincts and its peculiar thinking. Unfortunately, one would say, they also express their contents in the language of nature, which is strange and incomprehensible to us. It sets us the task of translating its images into the rational words and concepts of modern speech, which has liberated itself from its primitive encumbrances—notably from its mystical participation with things. Nowadays, talking of ghosts and other numinous figures is no longer the same as conjuring them up. We have ceased to believe in magical

formulas; not many taboos and similar restrictions are left; and our world seems to be disinfected of all such superstitious numina as "witches, warlocks, and worricows," to say nothing of werewolves, vampires, bush-souls, and all the other bizarre beings that populate the primeval forest.

[587] At least the surface of our world seems to be purified of all superstitious and irrational admixtures. Whether, however, the real inner world of man—and not our wish-fulfilling fiction about it—is also freed from primitivity is another question. Is not the number 13 still taboo for many people? Are there not still many individuals possessed by funny prejudices, projections, and illusions? A realistic picture of the human mind reveals many primitive traits and survivals, which are still playing their roles just as if nothing had happened during the last five hundred years. The man of today is a curious mixture of characteristics acquired over the long ages of his mental development. This is the man and his symbols we have to deal with, and we must scrutinize his mental products very carefully indeed. Sceptical viewpoints and scientific convictions exist in him side by side with old-fashioned prejudices, outdated habits of thought and feeling, obstinate misinterpretations, and blind ignorance.

[588] Such are the people who produce the symbols we are investigating in their dreams. In order to explain the symbols and their meaning, it is essential to learn whether these representations are still the same as they ever were, or whether they have been chosen by the dream for its particular purpose from a store of general conscious knowledge. If, for instance, one has to deal with a dream in which the number 13 occurs, the question is: Does the dreamer habitually believe in the unfavourable nature of the number, or does the dream merely allude to people who still indulge in such superstitions? The answer will make a great difference to the interpretation. In the former case, the dreamer is still under the spell of the unlucky 13, and will therefore feel most uncomfortable in room no. 13 or sitting at a table with thirteen people. In the latter case, 13 may not be more than a chiding or disparaging remark. In one case it is a still numinous representation; in the other it is stripped of its original

emotionality and has assumed the innocuous character of a mere piece of indifferent information.

[589] This illustrates the way in which archetypes appear in practical experience. In the first case they appear in their original form—they are images and at the same time emotions. One can speak of an archetype only when these two aspects coincide. When there is only an image, it is merely a word-picture, like a corpuscle with no electric charge. It is then of little consequence, just a word and nothing more. But if the image is charged with numinosity, that is, with psychic energy, then it becomes dynamic and will produce consequences. It is a great mistake in practice to treat an archetype as if it were a mere name, word, or concept. It is far more than that: it is a piece of life, an image connected with the living individual by the bridge of emotion. The word alone is a mere abstraction, an exchangeable coin in intellectual commerce. But the archetype is living matter. It is not limitlessly exchangeable but always belongs to the economy of a living individual, from which it cannot be detached and used arbitrarily for different ends. It cannot be explained in just any way, but only in the one that is indicated by that particular individual. Thus the symbol of the cross, in the case of a good Christian, can be interpreted only in the Christian way unless the dream produces very strong reasons to the contrary, and even then the specifically Christian meaning should not be lost sight of.

[590] The mere use of words is futile if you do not know what they stand for. This is particularly true in psychology, where we speak of archetypes like the anima and animus, the wise old man, the great mother, and so on. You can know about all the saints, sages, prophets, and other godly men, and all the great mothers of the world, but if they are mere images whose numinosity you have never experienced, it will be as if you were talking in a dream, for you do not know what you are talking about. The words you use are empty and valueless, and they gain life and meaning only when you try to learn about their numinosity, their relationship to the living individual. Then only do you begin to understand that the names mean very little, but that the way they are related to you is all-important.

[591] The symbol-producing function of our dreams is an attempt to bring our original mind back to consciousness, where it has never been before,

and where it has never undergone critical self-reflection. We *have been* that mind, but we have never *known* it. We got rid of it before understanding it. It rose from its cradle, shedding its primitive characteristics like cumbersome and valueless husks. It looks as if the unconscious represented the deposit of these remnants. Dreams and their symbols continually refer to them, as if they intended to bring back all the old primitive things from which the mind freed itself in the course of its evolution: illusions, childish fantasies, archaic thought-forms, primitive instincts. This is in reality the case, and it explains the resistance, even fear and horror, one experiences in approaching the unconscious. One is shocked less by the primitivity of its contents than by their emotionality. They are not merely neutral or indifferent, they are so charged with affect that they are often exceedingly uncomfortable. They can even cause real panic, and the more they are repressed the more they spread through the whole personality in the form of a neurosis.

[592] It is just their emotionality, however, that gives them such a vital importance. It is as if a man who has lived through a period of life in an unconscious state should suddenly realize that there is a gap in his memory—that important events seem to have taken place that he cannot remember. In so far as he assumes that the psyche is an exclusively personal affair (and this is the usual assumption), he will try to retrieve the apparently lost infantile memories. But the gaps in his childhood memories are merely the symptoms of a much greater loss, the loss of the primitive psyche—the psyche that lived and functioned before it was reflected by consciousness.

[593] As the evolution of the embryonic body repeats its prehistory, so the mind grows up through the series of its prehistoric stages. Dreams seem to consider it their main task to bring back a sort of recollection of the prehistoric as well as the infantile world, right down to the level of the most primitive instincts, as if such memories were a priceless treasure. And these memories can indeed have a remarkably healing effect in certain cases, as Freud saw long ago. This observation confirms the view that an infantile memory-gap (a so-called amnesia) amounts to a definite loss and that its recovery brings an increase in vitality and well-being. Since we measure a child’s psychic life by the paucity and simplicity of

its conscious contents, we do not appreciate the far-reaching complexities of the infantile mind that stem from its original identity with the prehistoric psyche. That “original mind” is just as much present and still functioning in the child as the evolutionary stages are in the embryo. If the reader remembers what I said earlier about the child who made a present of her dreams to her father, he will get a good idea of what I mean.

[594] In infantile amnesia, one finds strange admixtures of mythological fragments that also often appear in later psychoses. Images of this kind are highly numinous and therefore very important. If such recollections reappear in adult life, they may in some cases cause profound psychological disturbances, while in other people they can produce astonishing cures or religious conversions. Often they bring back a piece of life, missing for a long time, that enriches the life of an individual.

[595] The recollection of infantile memories and the reproduction of archetypal modes of psychic functioning create a wider horizon and a greater extension of consciousness, provided that one succeeds in assimilating and integrating the lost and regained contents. Since they are not neutral, their assimilation will modify the personality, even as they themselves will have to undergo certain alterations. In this part of the individuation process the interpretation of symbols plays an important practical role; for the symbols are natural attempts to reconcile and reunite often widely separated opposites, as is apparent from the contradictory nature of many symbols. It would be a particularly obnoxious error in this work of assimilation if the interpreter were to take only the conscious memories as “true” or “real,” while considering the archetypal contents as merely fantastic representations. Dreams and their ambiguous symbols owe their forms on the one hand to repressed contents and on the other to archetypes. They thus have two aspects and enable one to interpret in two ways: one lays the emphasis either on their personal or on their archetypal aspect. The former shows the morbid influence of repression and infantile wishes, while the latter points to the sound instinctive basis. However fantastic the archetypal contents may be, they represent emotional powers or “numinosities.” If one should try to brush them aside, they would only get repressed and would create the

same neurotic condition as before. Their numinosity gives the contents an autonomous nature. This is a psychological fact that cannot be denied. If it is nevertheless denied, the regained contents are annihilated and any attempt at a synthesis is futile. But it appears to be a tempting way out and therefore it is often chosen.

[596] Not only is the existence of archetypes denied, but even those people who do admit their existence usually treat them as if they were mere images and forget that they are living entities that make up a great part of the human psyche. As soon as the interpreter strips them of their numinosity, they lose their life and become mere words. It is then easy enough to link them together with other mythological representations, and so the process of limitless substitution begins; one glides from archetype to archetype, everything means everything, and one has reduced the whole process to absurdity. All the corpses in the world are chemically identical, but living individuals are not. It is true that the forms of archetypes are to a considerable extent interchangeable, but their numinosity is and remains a fact. It represents the *value* of an archetypal event. This emotional value must be kept in mind and allowed for throughout the whole intellectual process of interpretation. The risk of losing it is great, because thinking and feeling are so diametrically opposed that thinking abolishes feeling-values and vice versa. Psychology is the only science that has to take the factor of value (feeling) into account, since it forms the link between psychic events on the one hand, and meaning and life on the other.

[597] Our intellect has created a new world that dominates nature, and has populated it with monstrous machines. The latter are so indubitably useful and so much needed that we cannot see even a possibility of getting rid of them or of our odious subservience to them. Man is bound to follow the exploits of his scientific and inventive mind and to admire himself for his splendid achievements. At the same time, he cannot help admitting that his genius shows an uncanny tendency to invent things that become more and more dangerous, because they represent better and better means for wholesale suicide. In view of the rapidly increasing avalanche of world population, we have already begun to seek ways and means of keeping the rising flood at bay. But nature may anticipate all

our attempts by turning against man his own creative mind, and, by releasing the H-bomb or some equally catastrophic device, put an effective stop to overpopulation. In spite of our proud domination of nature we are still her victims as much as ever and have not even learnt to control our own nature, which slowly and inevitably courts disaster.

[598] There are no longer any gods whom we can invoke to help us. The great religions of the world suffer from increasing anaemia, because the helpful numina have fled from the woods, rivers, mountains, and animals, and the God-men have disappeared underground into the unconscious. There we suppose they lead an ignominious existence among the relics of our past, while we remain dominated by the great *Déesse Raison*, who is our overwhelming illusion. With her aid we are doing laudable things: we rid the world of malaria, we spread hygiene everywhere, with the result that under-developed populations increase at such a rate that food is becoming a problem. “We have conquered nature” is a mere slogan. In reality we are confronted with anxious questions, the answers to which seem nowhere in sight. The so-called conquest of nature overwhelms us with the natural fact of over-population and makes our troubles more or less unmanageable because of our psychological incapacity to reach the necessary political agreements. It remains quite natural for men to quarrel and fight and struggle for superiority over one another. Where indeed have we “conquered nature”?

[599] As any change must begin somewhere, it is the single individual who will undergo it and carry it through. The change must begin with one individual; it might be any one of us. Nobody can afford to look around and to wait for somebody else to do what he is loath to do himself. As nobody knows what he could do, he might be bold enough to ask himself whether by any chance his unconscious might know something helpful, when there is no satisfactory conscious answer anywhere in sight. Man today is painfully aware of the fact that neither his great religions nor his various philosophies seem to provide him with those powerful ideas that would give him the certainty and security he needs in face of the present condition of the world.

[600] I know that the Buddhists would say, as indeed they do: if only people would follow the noble eightfold path of the Dharma (doctrine,

law) and had true insight into the Self; or the Christians: if only people had the right faith in the Lord; or the rationalists: if only people could be intelligent and reasonable—then all problems would be manageable and solvable. The trouble is that none of them manages to solve these problems himself. Christians often ask why God does not speak to them, as he is believed to have done in former days. When I hear such questions, it always makes me think of the Rabbi who was asked how it could be that God often showed himself to people in the olden days but that nowadays one no longer saw him. The Rabbi replied: “Nor is there anyone nowadays who could stoop so low.”

[601] This answer hits the nail on the head. We are so captivated by and entangled in our subjective consciousness that we have simply forgotten the age-old fact that God speaks chiefly through dreams and visions. The Buddhist discards the world of unconscious fantasies as “distractions” and useless illusions; the Christian puts his Church and his Bible between himself and his unconscious; and the rationalist intellectual does not yet know that his consciousness is not his total psyche, in spite of the fact that for more than seventy years the unconscious has been a basic scientific concept that is indispensable to any serious student of psychology.

[602] We can no longer afford to be so God-almighty as to set ourselves up as judges of the merits or demerits of natural phenomena. We do not base our botany on a division into useful and useless plants, or our zoology on a classification into harmless and dangerous animals. But we still go on blithely assuming that consciousness is sense and the unconscious is nonsense—as if you could make out whether any natural phenomenon makes sense or not! Do microbes, for instance, make sense or nonsense? Such evaluations merely demonstrate the lamentable state of our mind, which conceals its ignorance and incompetence under the cloak of megalomania. Certainly microbes are very small and most despicable, but it would be folly to know nothing about them.

[603] Whatever else the unconscious may be, it is a natural phenomenon that produces symbols, and these symbols prove to be meaningful. We cannot expect someone who has never looked through a microscope to be an authority on microbes; in the same way, no one who has not made a

serious study of natural symbols can be considered a competent judge in this matter. But the general undervaluation of the human psyche is so great that neither the great religions nor the philosophies nor scientific rationalism have been willing to look at it twice. In spite of the fact that the Catholic Church admits the occurrence of dreams sent by God, most of its thinkers make no attempt to understand them. I also doubt whether there is a Protestant treatise on dogmatics that would “stoop so low” as to consider the possibility that the *vox Dei* might be perceived in a dream. But if somebody really believes in God, by what authority does he suggest that God is unable to speak through dreams?

[604] I have spent more than half a century investigating natural symbols, and I have come to the conclusion that dreams and their symbols are not stupid and meaningless. On the contrary, dreams provide you with the most interesting information if only you take the trouble to understand their symbols. The results, it is true, have little to do with such worldly concerns as buying and selling. But the meaning of life is not exhaustively explained by your business activities, nor is the deep desire of the human heart answered by your bank account, even if you have never heard of anything else.

[605] At a time when all available energy is spent in the investigation of nature, very little attention is paid to the essence of man, which is his psyche, although many researches are made into its conscious functions. But the really unknown part, which produces symbols, is still virtually unexplored. We receive signals from it every night, yet deciphering these communications seems to be such an odious task that very few people in the whole civilized world can be bothered with it. Man’s greatest instrument, his psyche, is little thought of, if not actually mistrusted and despised. “It’s only psychological” too often means: It is nothing.

[606] Where, exactly, does this immense prejudice come from? We have obviously been so busy with the question of what *we* think that we entirely forget what the unconscious psyche thinks about us. Freud made a serious attempt to show why the unconscious deserves no better judgment, and his teachings have inadvertently increased and confirmed the existing contempt for the psyche. Before him it had been merely

overlooked and neglected; now it has become a dump for moral refuse and a source of fear.

[607] This modern standpoint is surely onesided and unjust. It does not even accord with the known facts. Our actual knowledge of the unconscious shows it to be a natural phenomenon, and that, like nature herself, it is at least *neutral*. It contains all aspects of human nature—light and dark, beautiful and ugly, good and evil, profound and silly. The study of individual as well as collective symbolism is an enormous task, and one that has not yet been mastered. But at last a beginning has been made. The results so far gained are encouraging, and they seem to indicate an answer to many of the questions perplexing present-day mankind.

III

THE SYMBOLIC LIFE

[A seminar talk given on 5 April 1939 to the Guild of Pastoral Psychology, London. Issued privately, as a transcript from shorthand notes by Derek Kitchin, as Guild Lecture No. 80 (London, 1954). Jung had approved the transcript. Subsequently published, in abbreviated form, in *Darshana* (Moradabad, India), 1:3 (August 1961), 11–22; the issue was dedicated to the memory of C. G. Jung, who had died on 6 June of that year. The Guild Lecture is reproduced here with stylistic revisions.]

THE SYMBOLIC LIFE

Professor Jung was asked two questions:

First, had he any views on what was likely to be the next step in religious development? Did he, for example, think that there would be a new revelation—as some would phrase it, a new incarnation of the World Teacher, a new collective fantasy? Or was there likely to be a reinterpretation and new appreciation of the esoteric meaning of Christianity—perhaps with the aid of psychology? Or would there be no collective expression, but a period in which each man had to make his own individual contact and live out his own personal expression?

Secondly, would he explain why the believing Catholic was not subject to neurosis, and what could be done by the Protestant churches to counteract the tendency of their members to neurotic conditions?

[608] I am not as ambitious as the questions that have been put to me! I should like to start with the second question, about the Roman Catholics, which has not been considered as of primary importance, but which, from a technical point of view, deserves full attention.

[609] You have heard that I said Roman Catholics are less threatened by neurosis than members of other religious confessions. Of course there are Catholic neurotics just as well as others, but it is a fact that in my forty years of experience I have had no more than six practising Catholics among my patients. Naturally I do not count all those who *have been* Catholics, or who say that they are Catholics but who do not practise; but of practising Catholics I have had not more than about six. That is also the experience of my colleagues. In Zurich we are surrounded by Catholic cantons; not quite two-thirds of Switzerland is Protestant and the rest is Catholic. And then we have on the frontier Southern Germany, which is Catholic. So we should have a fair number of Catholic patients, but we have not; we have very few.

[610] I was once asked by students of divinity a very interesting question: whether in my view people in modern times, in case of psychological trouble, would go to the doctor rather than to the parson or the priest? Now, I said I could not answer that question, but I would enquire. So I sent round a questionnaire with detailed questions. I did not do it myself, because if I ask something, of course that is already a prejudice, and every answer would be prejudiced. So I gave the questionnaire to certain people who were not known to be acquainted with me, or in any kind of relation to me, and they sent it around, and we got hundreds of very interesting answers. And there I found the confirmation of what I already knew, namely, a large percentage—by far the majority—of Catholics said that, in case of psychological trouble, they would go to the priest and not to the doctor. The vast majority of Protestants said they would naturally go to the doctor. I had a very large number of answers from members of families of parsons, and they nearly all said that they would not go to the parson, they would rather go to the doctor. (I can talk quite freely about this. I am the son of a parson, and my grandfather was a sort of bishop, and I had five uncles all parsons, so I know something about the job! I have no hostile attitude to the clergy. On the contrary; but this is a fact.) I also had answers from Jews, and not one single Jew said he would go to the Rabbi—he wouldn't even think of it. And I had one Chinese, who gave me a classical answer. He said: "When I am young I go to the doctor, and when I am old I go to the philosopher."

[611] I also had answers from representatives of the clergy, and I must mention one answer, which I hope is not in any way representative, but which casts a certain light upon a certain kind of theologian. The writer said, "Theology has nothing to do with the practical man." What has it to do with, then? You could say, "With God"; but you are not going to tell me that theology deals with God in that sense. Theology is really meant for man, if it is meant for anything. God needs no theology, I should say. That [answer] is a symptom of a certain attitude which explains a lot.

[612] Now, I have spoken of my own experience in this field, but recently statistical researches have been made in America about the very same question, but from another angle. It is a sort of appreciation of the amount of complexes, or complex manifestations, you find in people.

You find the least or the smallest number of complex manifestations in practising Catholics, far more in Protestants, and the most in Jews. That is absolutely independent of my own researches; a colleague of mine in the United States made these researches,[1] and that bears out what I have told you.

[613] So there must be something in the Catholic Church which accounts for this peculiar fact. Of course, we think in the first place of confession. That is only the outer aspect. I happen to know a great deal about confession, because I have often had to do with the Catholic clergy, particularly with Jesuits, who were busy in psychotherapy. For many years the Catholic clergy have studied psychotherapy; they have followed it up very closely. In the first place it was, of course, the Jesuits who studied it, and now recently I have heard that the Benedictines have done so too. There is an old tradition in the Catholic Church of the *directeur de conscience*—a sort of leader of souls. These directors have an extraordinary amount of experience and training in that work, and I have often been amazed at the wisdom with which Jesuits and other Catholic priests advised their patients.

[614] Just recently it happened that a patient of mine, a woman of the nobility, who had a Jesuit father-confessor, discussed with him all the critical points of the analysis she made under my care. Of course, a number of things were not quite orthodox, and I was fully aware that there was a great conflict in her mind, and I advised her to discuss these matters with her father-confessor. (He was a famous Jesuit—he is now dead.) And then, after she had had that very frank talk, she told me all he said to her, and he had confirmed every word I had told her—a thing that was rather amazing to me, particularly from the mouth of a Jesuit. That opened my eyes to the extraordinary wisdom and culture of the Catholic *directeur de conscience*. And it explains to a certain extent why the practising Catholic would rather go to the priest.

[615] The fact is that there are relatively few neurotic Catholics, and yet they are living under the same conditions as we do. They are presumably suffering from the same social conditions and so on, and so one would expect a similar amount of neurosis. There must be something in the cult, in the actual religious practice, which explains that peculiar fact that

there are fewer complexes, or that these complexes manifest themselves much less in Catholics than in other people. That something, besides confession, is really the cult itself. It is the Mass, for instance. The heart of the Mass contains a living mystery, and that is the thing that works. When I say "a living mystery," I mean nothing mysterious; I mean mystery in that sense which the word has always had—a *mysterium tremendum*.[2] And the Mass is by no means the only mystery in the Catholic Church. There are other mysteries too. They begin with the very preparations, the simple things, in the Church. Take, for instance, the preparation of the baptismal water—the rite of the *benedictio fontis major*, or *minor*, on the night of the Sabbath before Easter. There you can see that a part of the Eleusinian Mysteries is still performed.

[616] If you ask the average priest, he is unable to give you any account of these things. He does not know them. I once asked the Bishop of Fribourg, in Switzerland, to send us a man who could give a good account of the mystery of the Mass. It was a sad failure; he could tell us nothing. He could only confess to the wonderful impression, the marvellous mystical feeling, but he could say nothing at all as to why he had that feeling. It was only sentiments, and we could do nothing with it. But if you go into the history of the rite, if you try to understand the whole structure of that rite, including all the other rites round it, then you see it is a mystery that reaches down into the history of the human mind; it goes back very far—far beyond the beginnings of Christianity. You know that very important parts of the Mass—for instance, the Host—belonged to the cult of Mithras. In the cult of Mithras they used bread stamped with the cross, or divided into four; they used the little bells; and they used baptismal water—that is quite certainly pre-Christian. We even have texts that bear this out. The rite of the divine water, or the *aqua permanens*—the "eternal water"—is an alchemical conception, older than its Christian use; and when you study the *benedictio fontis*, the actual making of the water, you see that it is an alchemical procedure; and we have a text from the first century, a text of Pseudo-Democritus, which says what the blessing was done for.

[617] These are absolute facts which are quite surely established. They point back into prehistory, into a continuity of tradition perhaps hundreds

of years before Christianity. Now these mysteries have always been the expression of a fundamental psychological condition. Man expresses his most fundamental and most important psychological conditions in this ritual, this magic, or whatever you call it. And the ritual is the cult performance of these basic psychological facts. That explains why we should not change anything in a ritual. A ritual must be done according to tradition, and if you change one little point in it, you make a mistake. You must not allow your reason to play with it. For instance, take that most difficult dogma, the dogma of the Virgin Birth: it is absolutely wrong to rationalize it. If you leave it as it is, as it has been handed down, then it is true; but if you rationalize it, it is all wrong, because then you shift it over to the plane of our playful intellect, which does not understand the secret. It is the secret of virginity and the virginal conception, and that is a most important psychological fact. The sad truth is that we do not understand it any more. But, you know, in former centuries man did not need that kind of intellectual understanding. We are very proud of it; but it is nothing to be proud of. Our intellect is absolutely incapable of understanding these things. We are not far enough advanced psychologically to understand the truth, the extraordinary truth, of ritual and dogma. Therefore such dogmas should never be submitted to any kind of criticism.

[618] So, you see, if I treat a real Christian, a real Catholic, I always keep him down to the dogma, and say, "You stick to it! And if you begin to criticize it in any way intellectually, then I am going to analyse you, and then you are in the frying-pan!" When a practising Catholic comes to me, I say, "Did you confess this to your father-confessor?" Naturally he says, "No, he does not understand." "What in hell, then," I say, "did you confess?" "Oh, lousy little things of no importance"—but the main sins he never talked of. As I said, I have had quite a number of these Catholics—six. I was quite proud to have so many, and I said to them, "Now, you see, what you tell me here, this is really serious. You go now to your father-confessor and you confess, whether he understands or does not understand. That is of no concern. It must be told before God, and if you don't do it, you are out of the Church, and then analysis begins, and then things will get hot, so you are much better off in the lap of the Church." So, you see, I brought these people back into the Church, with

the result that the Pope himself gave me a private blessing for having taught certain important Catholics the right way of confessing.

[619] For instance, there was a lady who played a very great role in the war. She was very Catholic, and always in the summer she used to come to Switzerland to pass her summer holiday. There is a famous monastery there with many monks, and she used to go to it for confession and spiritual advice. Now, being an interesting person, she got a bit too interested in her father-confessor, and he got a bit too interested in her, and there was some conflict. He was then removed to the Clausura,[3] and she naturally collapsed, and she was advised to go to me. So she came to me in full resistance against the authorities who had interfered, and I made her go back to her spiritual authorities and confess the whole situation. And when she went back to Rome, where she lived, and where she had a confessor, he asked her, "Well, I know you from many years ago: how is it that you now confess so freely?" And she said she had learnt it from a doctor. That is the story of how I got the Pope's private blessing.

[620] My attitude to these matters is that, as long as a patient is really a member of a church, he ought to be serious. He ought to be really and sincerely a member of that church, and he should not go to a doctor to get his conflicts settled when he believes that he should do it with God. For instance, when a member of the Oxford Group comes to me in order to get treatment, I say, "You are in the Oxford Group; so long as you are there, you settle your affair with the Oxford Group. I can't do it better than Jesus."

[621] I will tell you a story of such a case. A hysterical alcoholic was cured by this Group movement, and they used him as a sort of model and sent him all round Europe, where he confessed so nicely and said that he had done wrong and how he had got cured through the Group movement. And when he had repeated his story twenty, or it may have been fifty, times, he got sick of it and took to drink again. The spiritual sensation had simply faded away. Now what are they going to do with him? They say, now he is pathological, he must go to a doctor. See, in the first stage he has been cured by Jesus, in the second by a doctor! I should and did refuse such a case. I sent that man back to these people and said, "If you

believe that Jesus has cured this man, he will do it a second time. And if he can't do it, you don't suppose that I can do it better than Jesus?" But that is just exactly what they do expect: when a man is pathological, Jesus won't help him but the doctor will.

[622] As long as a fellow believes in the Oxford Group movement, he stays there; and as long as a man is in the Catholic Church, he is in the Catholic Church for better or worse and he should be cured by those means. And mind you, I have seen that they can be cured by those means—that is a fact! Absolution, the Holy Communion, can cure them, even in very serious cases. If the experience of the Holy Communion is real, if the ritual and the dogma fully express the psychological situation of that individual, he can be cured. If the ritual and dogma do not fully express the psychological situation of that individual, he can't be cured. That is the reason why you have Protestantism, and that is why Protestantism is so uncertain, why it splits and splits. That is no objection to Protestantism; it is exactly the same as the story about the Code Napoléon.

[623] After the Code Napoléon had been in use a year, the man entrusted with the execution of Napoleon's orders came back with a portfolio of immense size. Napoleon looked at it and asked, "Mais comment? Est-ce que le Code est mort?"—because the man had so many propositions to make. But the man answered, "Au contraire, Sire; il vit!"

[624] The splitting up of Protestantism into new denominations—four hundred or more we have—is a sign of life. But, alas! It is not a very nice sign of life, in the sense of a church, because there is no dogma and there is no ritual. There is not the typical symbolic life.

[625] You see, man is in need of a symbolic life—badly in need. We only live banal, ordinary, rational, or irrational things—which are naturally also within the scope of rationalism, otherwise you could not call them irrational. But we have no symbolic life. Where do we live symbolically? Nowhere, except where we participate in the ritual of life. But who, among the many, are really participating in the ritual of life? Very few. And when you look at the ritual life of the Protestant Church, it is almost nil. Even the Holy Communion has been rationalized. I say that from the Swiss point of view: in the Swiss Zwinglian Church the Holy

Communion is not a communion at all; it is a meal of memory. There is no Mass either; there is no confession; there is no ritual, symbolic life.

[626] Have you got a corner somewhere in your house where you perform the rites, as you can see in India? Even the very simple houses there have at least a curtained corner where the members of the household can lead the symbolic life, where they can make their new vows or meditation. We don't have it; we have no such corner. We have our own room, of course —but there is a telephone which can ring us up at any time, and we always must be ready. We have no time, no place. Where have we got these dogmatic or these mysterious images? Nowhere! We have art galleries, yes—where we kill the gods by thousands. We have robbed the churches of their mysterious images, of their magical images, and we put them into art galleries. That is worse than the killing of the three hundred children in Bethlehem; it is a blasphemy.

[627] Now, we have no symbolic life, and we are all badly in need of the symbolic life. Only the symbolic life can express the need of the soul—the daily need of the soul, mind you! And because people have no such thing, they can never step out of this mill—this awful, grinding, banal life in which they are "nothing but." In the ritual they are near the Godhead; they are even divine. Think of the priest in the Catholic Church, who is in the Godhead: he carries himself to the sacrifice on the altar; he offers himself as the sacrifice. Do we do it? Where do we know that we do it? Nowhere! Everything is banal, everything is "nothing but"; and that is the reason why people are neurotic. They are simply sick of the whole thing, sick of that banal life, and therefore they want sensation. They even want a war; they all want a war. They are all glad when there is a war: they say, "Thank heaven, now something is going to happen—something bigger than ourselves!"

[628] These things go pretty deep, and no wonder people get neurotic. Life is too rational, there is no symbolic existence in which I am something else, in which I am fulfilling my role, my role as one of the actors in the divine drama of life.

[629] I once had a talk with the master of ceremonies of a tribe of Pueblo Indians, and he told me something very interesting. He said, "Yes, we are a small tribe, and these Americans, they want to interfere with our

religion. They should not do it," he said, "because we are the sons of the Father, the Sun. He who goes there"; pointing to the sun)—'that is our Father. We must help him daily to rise over the horizon and to walk over Heaven. And we don't do it for ourselves only: we do it for America, we do it for the whole world. And if these Americans interfere with our religion through their missions, they will see something. In ten years Father Sun won't rise any more, because we can't help him any more."

[630] Now, you may say, that is just a sort of mild madness. Not at all! These people have no problems. They have their daily life, their symbolic life. They get up in the morning with a feeling of their great and divine responsibility: they are the sons of the Sun, the Father, and their daily duty is to help the Father over the horizon—not for themselves alone, but for the whole world. You should see these fellows: they have a natural fulfilled dignity. And I quite understood when he said to me, "Now look at these Americans: they are always seeking something. They are always full of unrest, always looking for something. What are they looking for? There is nothing to be looked for!" That is perfectly true. You can see them, these travelling tourists, always looking for something, always in the vain hope of finding something. On my many travels I have found people who were on their third trip round the world—uninterruptedly. Just travelling, travelling; seeking, seeking. I met a woman in Central Africa who had come up alone in a car from Cape Town and wanted to go to Cairo. "What for?" I asked. "What are you trying to do that for?" And I was amazed when I looked into her eyes—the eyes of a hunted, a cornered animal—seeking, seeking, always in the hope of something. I said, "What in the world are you seeking? What are you waiting for, what are you hunting after?" She is nearly possessed; she is possessed by so many devils that chase her around. And why is she possessed? Because she does not live the life that makes sense. Hers is a life utterly, grotesquely banal, utterly poor, meaningless, with no point in it at all. If she is killed today, nothing has happened, nothing has vanished—because she was nothing! But if she could say, "I am the daughter of the Moon. Every night I must help the Moon, my Mother, over the horizon"—ah, that is something else! Then she lives, then her life makes sense, and makes sense in all continuity, and for the whole of humanity. That gives

peace, when people feel that they are living the symbolic life, that they are actors in the divine drama. That gives the only meaning to human life; everything else is banal and you can dismiss it. A career, producing of children, are all *maya* compared with that one thing, that your life is meaningful.

[631] That is the secret of the Catholic Church: that they still, to a certain extent, can live the meaningful life. For instance, if you can watch daily the sacrifice of the Lord, if you can partake of his substance, then you are filled with the Deity, and you daily repeat the eternal sacrifice of Christ. Of course, what I say is just so many words, but to the man who really lives it, it means the whole world. It means more than the whole world, because it makes sense to him. It expresses the desire of the soul; it expresses the actual facts of our unconscious life. When the wise man said, “Nature demands death,” he meant just that.

[632] So I think we can go on now to the next question. What I have spoken of is, alas, to a great extent the past. We cannot turn the wheel backwards; we cannot go back to the symbolism that is gone. No sooner do you know that this thing is symbolic than you say, “Oh, well, it presumably means something else.” Doubt has killed it, has devoured it. So you cannot go back. I cannot go back to the Catholic Church, I cannot experience the miracle of the Mass; I know too much about it. I know it is the truth, but it is the truth in a form in which I cannot accept it any more. I cannot say “This is the sacrifice of Christ,” and see him any more. I cannot. It is no more true to me; it does not express my psychological condition. My psychological condition wants something else. I must have a situation in which that thing becomes true once more. I need a new form. When one has had the misfortune to be fired out of a church, or to say “This is all nonsense,” and to quit it—that has no merit at all. But to be in it and to be forced, say, by God, to leave it—well, then you are legitimately *extra ecclesiam*. But *extra ecclesiam nulla salus;* then things really become terrible, because you are no more protected, you are no more in the *consensus gentium*, you are no more in the lap of the All-compassionate Mother. You are alone and you are confronted with all the demons of hell. That is what people don’t know. Then they say you have an anxiety neurosis, nocturnal fears, compulsions—I don’t

know what. Your soul has become lonely; it is *extra ecclesiam* and in a state of no-salvation. And people don’t know it. They think your condition is pathological, and every doctor helps them to believe it. And, of course, when they say, and when everybody holds, that this is neurotic and pathological, then we have to talk that language. I talk the language of my patients. When I talk with lunatics, I talk the lunatic language, otherwise they don’t understand me. And when I talk with neurotics, I talk neurotic with them. But it is neurotic talk when one says that this is a neurosis. As a matter of fact it is something quite different: it is the terrific fear of loneliness. It is the hallucination of loneliness, and it is a loneliness that cannot be quenched by anything else. You can be a member of a society with a thousand members, and you are still alone. That thing in you which should live is alone; nobody touches it, nobody knows it, you yourself don’t know it; but it keeps on stirring, it disturbs you, it makes you restless, and it gives you no peace.

[633] So, you see. I was forced simply through my patients to try to find out what we could do about such a condition. I am not going to found a religion, and I know nothing about a future religion. I only know that in certain cases such and such things develop. For instance, take any case you want: if I go far enough, if the case demands it, or if certain conditions are favourable, then I shall observe certain unmistakable things, namely, that the unconscious facts are coming up and becoming threateningly clear. That is very disagreeable. And therefore Freud had to invent a system to protect people, and himself, against the reality of the unconscious, by putting a most depreciatory explanation upon these things, an explanation that always begins with “nothing but.” The explanation of every neurotic symptom was known long ago. We have a theory about it: it is all due to a father fixation, or to a mother fixation; it is all nonsense, so you can dismiss it. And so we dismiss our souls—”Oh, I am bound by a fixation to my mother, and if I see that I have all kinds of impossible fancies about my mother, I am liberated from that fixation.” If the patient succeeds, he has lost his soul. Every time you accept that explanation you lose your soul. You have not helped your soul; you have replaced your soul by an explanation, a theory.

[634] I remember a very simple case.[4] There was a student of philosophy, a very intelligent woman. That was quite at the beginning of my career. I was a young doctor then, and I did not know anything beyond Freud. It was not a very important case of neurosis, and I was absolutely certain that it could be cured; but the case had not been cured. That girl had developed a terrific father-transference to me—projected the image of the father on me. I said, "But, you see, I'm not your father!" "I know," she said, "that you're not my father, but it always seems as if you were." She behaved accordingly and fell in love with me, and I was her father, brother, son, lover, husband—and, of course, also her hero and saviour—every thinkable thing! "But," I said, "you see, that is absolute nonsense!" "But I can't live without it," she answered. What could I do with that? No depreciatory explanation would help. She said, "You can say what you like; it is so." She was in the grip of an unconscious image. Then I had the idea: "Now, if anybody knows anything about it, it must be the unconscious, that has produced such an awkward situation." So I began to watch the dreams seriously, not just in order to catch certain fantasies, but because I really wanted to understand how her psychic system reacted to such an abnormal situation—or to such a very normal situation, if you like to say so, because that situation is usual. She produced dream? in which I appeared as the father. That we dealt with. Then I appeared as the lover, and I appeared as the husband—that was all in the same vein. Then I began to change my size: I was much bigger than an ordinary human being; sometimes; I had even divine attributes. I thought "Oh, well, that is the old saviour idea." And then I took on the most amazing forms. I appeared, for instance, the size of a god, standing in the fields and holding her in my arms as if she were a baby, and the wind was blowing over the corn and the fields were waving like waves of water, and in the same way I rocked her in my arms. And then, when I saw that picture, I thought, "Now I see what the unconscious really is after: the unconscious wants to make a god of me: that girl needs a god—at least, her unconscious needs a god. Her unconscious wants to find a god, and because it cannot find a god, it says Dr. Jung is a god." And so I said to her what I thought: "I surely am not a god, but your unconscious needs a god. That is a serious and a genuine need. No time before us has

fulfilled that need; you are just an intellectual fool, just as much as I am, but we don't know it." That changed the situation completely; it made all the difference in the world. I cured that case, because I fulfilled the need of the unconscious.

[635] I can tell you another case.[5] The patient was a Jewish girl. She was a funny little character, a very pretty, elegant little thing—and I thought "What a useless beast!" She had a frightful neurosis, a terrible anxiety neurosis, with awful attacks of fear, and she had suffered from these things for years. She had been with another analyst and had turned his head altogether; he fell in love with her, and she found no help in him. Then she came to me. The night before she came—before I had seen her at all—I had a dream, and I dreamed of a young girl, a pretty girl that came to me and I did not understand her case at all. Suddenly I thought, "By Jove! Hasn't she an extraordinary father complex!" And I felt it as a sort of revelation. I was much impressed by that dream; I did not know to what it referred. Then, when that girl came in next day, instantly I thought of my dream: "Perhaps she is the one!" First she told me her story. At first I couldn't see what it was all about, and then I thought, "Isn't it a father complex?" I saw nothing of a father complex, but it gave me the idea of asking more about the history of her family. Then I found out that she came from a Hasidic family—you know, those great mystics. Her grandfather had been a sort of wonder-rabbi—he had second sight—and her father had broken away from that mystic community, and she was completely sceptical and completely scientific in her outlook on life. She was highly intelligent, with that murderous kind of intellect that you very often find in Jews. So I thought, "Aha! What does that mean with reference to her neurosis? Why does she suffer from such an abysmal fear?" And I said to her, "Look here, I'm going to tell you something, and you will probably think it is all foolishness, but you have been untrue to your God. Your grandfather led the right life, but you are worse than a heretic; you have forsaken the mystery of your race. You belong to holy people, and what do you live? No wonder that you fear God, that you suffer from the fear of God."

[636] Within one week I had cured that anxiety neurosis, and that is no lie (I am too old to lie!)—that is a fact. Before she had had months, many

months, of analysis, but all too rational. With that remark she turned the corner, as if she suddenly began to understand, and her whole neurosis collapsed. It had no point in it any more: it had been based upon the mistake that she could live with her miserable intellect alone in a perfectly banal world, when in fact she was a child of God and should have lived the symbolic life, where she would have fulfilled the secret will in herself that was also in her family. She had forgotten all that, and was living, of course, in full contradiction to her whole natural system. Suddenly her life had a meaning, and she could live again; her whole neurosis went by the board.

[637] In other cases, of course, it is not so—should I say—simple (it was not quite simple, you know!). I do not want to tell you further details of that case. It was a most instructive one, but I would rather tell you of other cases where things are not so simple, where you have to guide people quite slowly and wait for a long time until the unconscious produces the symbols that bring them back into the original symbolic life. Then you have to know a great deal about the language of the unconscious, the language of dreams. Then you see how the dreams begin to produce extraordinary figures. These are all found in history under different names. They are unknown quantities, but you find these figures in a literature which is itself completely obsolete. If you happen to know these symbols, you can explain to your patients what the unconscious is after.

[638] Of course, I can't give you a full description of these things, I can only mention them. From my observations I learned that the modern unconscious has a tendency to produce a psychological condition which we find, for instance, in medieval mysticism. You find certain things in Meister Eckhart; you find many things in Gnosticism; that is a sort of esoteric Christianity. You find the idea of the Adam Kadmon in every man—the Christ within. Christ is the second Adam, which is also, in exotic religions, the idea of the Atman or the complete man, the original man, the “all-round’ man of Plato, symbolized by a circle or a drawing with circular motifs. You find all these ideas in medieval mysticism; you find them all through alchemical literature, beginning with the first century after Christ. You find them in Gnosticism, you find many of them

in the New Testament, of course, in Paul. But it is an absolutely consistent development of the idea of Christ within—not the historical Christ without, but the Christ within; and the argument is that it is immoral to allow Christ to suffer for us, that he has suffered enough, and that we should carry our own sins for once and not shift them off on to Christ—that we should carry them all. Christ expresses the same idea when he says, "I appear in the least of your brethren";[6] and what about it, my dear son, if the least of your brethren should be yourself—what about it then? Then you get the intimation that Christ is not to be the least in your life, that we have a brother in ourselves who is really the least of our brethren, much worse than the poor beggar whom you feed. That is, in ourselves we have a shadow; we have a very bad fellow in ourselves, a very poor man, and he has to be accepted. What has Christ done—let us be quite banal about it—what has Christ done when we consider him as an entirely human creature? Christ was disobedient to his mother; Christ was disobedient to his tradition: Christ falsified himself, and played it out to the bitter end: he carried through his hypothesis to the bitter end. How was Christ born? In the greatest misery. Who was his father? He was an illegitimate child—humanly the most miserable situation: a poor girl having a little son. That is our symbol, that is ourselves; we are all that. And if anyone lives his own hypothesis to the bitter end (and pays with his death, perhaps, he knows that Christ is his brother.

[639] That is modern psychology, and that is the future. That is the true future, that is the future of which I know—but, of course, the historical future might be quite different. We do not know whether it is not the Catholic Church that will reap the harvest that is now going to be cut down. We do not know that. We do not know whether Hitler is going to found a new Islam. (He is already on the way; he is like Mohammed. The emotion in Germany is Islamic; warlike and Islamic. They are all drunk with a wild god.) That can be the historic future. But I do not care for a historic future at all, not at all; I am not concerned with it. I am only concerned with the fulfilment of that will which is in every individual. My history is only the history of those individuals who are going to fulfil their hypotheses. That is the whole problem; that is the problem of the true Pueblo: that I do today everything that is necessary so that my Father

can rise over the horizon. That is my standpoint. Now I think I have talked enough!

Discussion

Canon H. England:

[640] In the Church of England ritual we have, after the Holy Communion: "Here we offer and present unto Thee, O Lord, ourselves, our souls and bodies, to be a reasonable, holy, and lively sacrifice." That is the sacrifice and that is the ritual which should satisfy the conditions you demand, is it not?

Professor Jung:

[641] Absolutely. Yes, the Church of England has a great asset in that. The Church of England, of course, is not the whole Protestant world, and it is not quite Protestant in England.

The Bishop of Southwark:

[642] The question is whether it is quite a Protestant world.

Professor Jung:

[643] But I should call the Church of England a real church. Protestantism in itself is no church at all.

The Bishop of Southwark:

[644] But there are other parts of the Protestant world which have churches. There are, for instance, the Lutherans in Sweden; take them as an example of a reformed church. Their conditions are more like our own. Have your ever come across the Orthodox ritual? Does the Russian ritual have the same effect?

Professor Jung:

[645] I am afraid that, owing to historical events, the whole thing has been interrupted. I have seen a few Orthodox people, and I am afraid they were no longer very orthodox.

The Bishop of Southwark:

[646] I meet a good number of Russian exiles in Paris, in a colony there, who are very deliberately trying to keep alive the old Russian religious life with as little change as possible.

Professor Jung:

[647] I have never seen a real member of the Orthodox Church, but I am quite convinced that as they live the symbolic life in that church they are all right.

The Bishop of Southwark:

[648] We Anglicans are in much closer touch with the Orthodox Church than with the Catholics, and they seem to us rather too symbolic—not quite to be facing up to the straight path, the facts they ought to be dealing with. They have rather the exile psychology—a world of their own—and I am rather frightened of that psychology for some of our own people, who seem to want to take refuge in symbolism from the responsibilities of life.

Professor Jung:

[649] With the best truth you can cheat; you can cheat with anything, so there are people who take illegitimate refuge in symbolism. For instance, monasteries are full of people who run away from life and its obligations and live the symbolic life—the symbolic life of their past. Such cheats are always punished, but it is a peculiar fact that they can stand it somehow without getting too neurotic. There is a peculiar value in the symbolic life. It is a fact that the primitive Australians sacrifice to it two-thirds of their available time—of their lifetime in which they are conscious.

The Bishop of Southwark:

[650] King Alfred the Great did something very much like that.

Professor Jung:

[651] Yes, that is the secret of primitive civilizations.

The Bishop of Southwark:

[652] He was a very practical civilizing man.

Professor Jung:

[653] Yes, because the very fact that you live the symbolic life has an extraordinarily civilizing influence. Those people are far more civilized and creative on account of the symbolic life. People who are only rational have very little influence; it is all talk, and with talk you get nowhere.

Canon England:

[654] But symbols may appeal to reason, for all that; to an enlightened reason.

Professor Jung:

[655] They may, yes! Symbols often cause an extraordinary intensity of mental life, even of intellectual life. If you look through the Patristic literature you find mountains of emotion, all couched in symbolism.

The Reverend D. Glan Morgan:

[656] But what are the Protestants to do now, especially we of the left—the Free Churches—the Nonconformists? We have no symbols at all, we have rejected them, lock, stock, and barrel. Our chapels are dead, our pulpits are platforms.

Professor Jung:

[657] Excuse me! You have a lot of symbolism still. You speak of God or of Jesus? There you are! What could be more symbolic? God is a symbol of symbols!

Mr. Morgan:

[658] Even that symbol becomes a contradiction. And there are crowds of people in our churches who can believe in Jesus Christ, but who cannot believe in God.

Professor Jung:

[659] Yes, and in the Catholic Church there are plenty who believe in the Church, but don't believe in God—nor in anything else!

The Bishop of Southwark:

[660] How far has this something to do with it? Not only has the Roman Catholic Church a very full symbolic system, but it is combined with the profession of absolute certitude—the dogma of infallibility. That must have a direct bearing on the value of symbols.

Professor Jung:

[661] Very important. The Church is absolutely right, wholly right, in insisting on that absolute validity, otherwise she opens the door to doubt.

Dr. Ann Harling:

[662] To conflict or neurosis?

Professor Jung:

[663] Absolutely. Therefore "extra ecclesiam nulla salus."

The Bishop of Southwark:

[664] Are all forms of conflict neurosis?

Professor Jung:

[665] Only when the intellect breaks away from that symbolic observance. When the intellect does not serve the symbolic life it is the devil: it makes you neurotic.

Mr. Morgan:

[666] May there be a transition, a moving ever from one system to another, and may not that be neurotic?

Processor Jung:

[667] Neurosis is a transitory phase, it is the unrest between two positions.

Mr. Morgan:

[668] I am asking because I myself feel at the moment that there is a good deal of neurosis among Protestants on account of the price that has to be paid for moving over from one state to the other.

Professor Jung:

[669] That is what I say: “extra ecclesiam nulla salus.” you get into a terrible frying-pan when you get out of the Church: therefore I don’t wish it on people. I point out the validity of the primary Church.

The Bishop of Southwark:

[670] What are we to do with the great majority of people we have to deal with who are not in any church? They say they are in the Church of England, but they don’t belong in any sense.

Professor Jung:

[671] I am afraid you can’t do anything with such people. The Church is there and is valid for those who are inside. Those who are outside the walls of the Church cannot be brought back into the Church by the

ordinary means. But I wish the clergy would understand the language of the soul, and that the clergyman would be a *directeur de conscience!* Why should I be a *directeur de conscience?* I am a doctor: I have no preparation for that. It is the natural calling of the clergyman: he should do it. Therefore I wish that a new generation of clergymen would come in and do the same as they do in the Catholic Church: that they would try to translate the language of the unconscious, even the language of dreams, into proper language. For instance, I know that there is now in Germany the Berneuchener Circle,[7] a liturgical movement; and one of the main representatives is a man who has a great knowledge of symbolism. He has given me quite a number of instances, which I am able to check, where he translated the figures in dreams into dogmatic language with the greatest success, and these people quietly slipped back into the order of the Church. They have no right to be neurotic. They belong to a church, and if you can help them to slip back to the Church you have helped them. Several of my patients became Catholics, others went back into the Church organization. But it must be something that has substance and form. It is by no means true that when one analyses somebody he necessarily jumps into the future. He is perhaps meant for a church, and if he can go back into a church, perhaps that is the best thing that can happen.

Mr. Morgan:

[672] What if he can’t?

Professor Jung:

[673] Then there is trouble; then he has to go on the Quest; then he has to find out what his soul says; then he has to go through the solitude of a land that is not created. I have published such an example in my lectures[8]—that of a great scientist, a very famous man, who lives today.[9] He set out to see what the unconscious said to him, and it gave him a wonderful lead. That man got into order again because he gradually accepted the symbolic data, and now he leads the religious life, the life of the careful

observer. Religion is careful observation of the data. He now observes all the things that are brought him by his dreams; that is his only guidance.

[674] We are in a new world with that; we are exactly like primitives. When I went to East Africa, I went to a small tribe in Mount Elgon and I asked the medicine-man about dreams. He said, "I know what you mean; my father still had dreams." I said, "You have no dreams?" And then he wept and answered, "No, I have no dreams any more." I asked, "Why?" He answered, "Since the British came into the country." "Now, how is that?" He said, "The District Commissioner knows when there shall be war; he knows when there are diseases; he knows where we must live—he does not allow us to move." The political guidance is now represented by the D.C., by the superior intelligence of the white man; therefore, why should they need dreams? Dreams were the original guidance of man in the great darkness. Read that book of Rasmussen's about the Polar Eskimos.[10] There he describes how a medicine-man became the leader of his tribe on account of a vision. When a man is in the wilderness, the darkness brings the dreams—*somnia a Deo missa*—that guide him. It has always been so. I have not been led by any kind of wisdom; I have been led by dreams, like any primitive. I am ashamed to say so, but I am as primitive as any nigger,[11] because I do not know! When you are in the darkness you take the next thing, and that is a dream. And you can be sure that the dream is your nearest friend; the dream is the friend of those who are not guided any more by the traditional truth and in consequence are isolated. That was the case with the old alchemical philosophers, and you read in the *Tractatus Aureus* of Hermes Trismegistus a passage that bears out what I said about isolation. There you read: "(Deus) in quo est adiuvatio cuiuslibet sequestrati" (God, in whom is the help of all who are lonely). Hermes, at the same time, was a real leader of souls and the very incarnation of inspiration, thus representing the unconscious manifest in dreams. So, you see, the one who is going alone and has no guidance, he has the *somnia a Deo missa;* he has no D.C. Of course, when we have a D.C. we do not need a dream, but when we are alone, that is something else.

The Bishop of Southwark:

[675] A practising parson, a Roman Catholic, has a D.C., an authority, and does not need dreams.

Professor Jung:

[676] Agreed! Nevertheless, there are people in the Church who have *somnia a Deo missa*, and the Church is very careful to appreciate the importance of such dreams. They don't deny the fact that there are *somnia a Deo missa;* the Church reserves the right of judgment, but they do consider it.

Lt.-Colonel H. M. Edwards:

[677] Are Roman Catholic priests being trained as psychotherapists?

Professor Jung:

[678] Yes.

Colonel Edwards:

[679] Not in this country?

Professor Jung:

[680] No, the Jesuits are. For example, the main father-confessor of Jena is a Jesuit trained in psychotherapy.

Dr. A. D. Belilios:

[681] Of the Jungian school?

Professor Jung:

[682] Of all schools. I am afraid he doesn't go as far as I go. I asked him about his position as to dreams, and he said, "Well, there we have to be careful, and we are already a bit suspect. We have the means of grace of the Church." "Right you are," I said, "you don't need dreams. I can give

no absolution, I have no means of grace; therefore I must listen to dreams. I am a primitive; you are a civilized man.” In a way that man is much more wonderful than I am. He can be a saint; I cannot be a saint—I can only be a nigger, very primitive, going by the next thing—quite superstitious.

Wing-Commander T. S. Rippon:

[683] How do you feel with the question of life after death?

Professor Jung:

[684] I have not been there consciously yet. When I die, I shall say “Now, let us see!” For the time being I am in this form, and I say, “Now, what is here? Let us do everything we can here.” If, when we die, we find there is a new life, I shall say, “Now let us live once more—*encore une fois!”* I don’t know, but I can tell you this: the unconscious has no time. There is no trouble about time in the unconscious. Part of our psyche is not in time and not in space. They are only an illusion, time and space, and so in a certain part of our psyche time does not exist at all.

Mr. Derek Kitchin:

[685] You wrote somewhere, Professor, that for many persons a belief in a future life was a necessity to psychological health.

Professor Jung:

[686] Yes. You would be out of tune if you did not consider immortality when your dreams put you up against that problem; then you should decide. If they don’t you can leave it. But if they put you up against it, then you have to say, “I must try how I feel. Let us assume that there is no such thing as immortality, no life after death: how do I feel about that? How do I function with such a conviction?” Then, perhaps, your stomach goes wrong. So you say, “Let us assume that I am immortal,” and then you function. So you must say, “That must be right.” How do we know? How does an animal know that the particular bit of grass it has eaten is

not poisonous, and how do animals know that something is poisonous? They go wrong. That is how we know the truth: the truth is that which helps us to live—to live properly.

The Reverend Francis Boyd:

[687] That which works; the pragmatic test.

Professor Jung:

[688] That which really works. I have no assumptions about these things. How can I? I only know that if I live in a certain way I live wrongly; I am unhealthy. And if I live in another way I am right. For instance, if the Pueblos believe that they are the sons of the Father Sun, they are in order. So I say, "I wish I could be a son of the Sun." Alas! I can't do it; I can't afford it; my intellect doesn't allow it. So I am bound to find another form. But they are all right. It would be the greatest mistake to tell those people that they are not the sons of the Sun. I tried, for instance, the argument of St. Augustine:[12] "Non est Dominus Sol factus, sed per quem Sol factus est" (God is not the sun but the one who made the sun). But my Pueblo got into a frightful state; he thought that was the most awful blasphemy. He said, "This *is* the Father; there is no Father behind it. How can we think of a Father we cannot see?" And in so far as they live in that belief, it is true. Anything that *lives* on earth, is true. So the Christian dogma is true, much truer than we have ever thought. We think we are much cleverer. As long as we don't understand it, as long as we don't see where it could lead beyond, there is no reason why we should give it up. If we see we are out of it, then we have what we call a superior point of view. That is another thing. Analysis is merely a means of making us more conscious of our perplexity; we are all on the Quest.

The Bishop of Southwark:

[689] Would you say the same of the Nazi or the Mohammedan, that they are right to go on in their faith?

Professor Jung:

[690] God is terrible; the living God is a living fear. I think it is an instrument, as Mohammed was for that people. All people, for instance, who are filled with that uncanny power, are always most disagreeable for others. I am quite convinced that some of the people in the Old Testament were very disagreeable people.

The Reverend W. Hopkins:

[691] There is obviously, and always has been, a conflict between science and religion. It is not so acute now as it has been. How do you bring about a reconciliation, which obviously is the sort of thing that is needed?

Professor Jung:

[692] There is no conflict between religion and science. That is a very old-fashioned idea. Science has to consider what there is. There is religion, and it is one of the most essential manifestations of the human mind. It is a fact, and science has nothing to say about it; it simply has to confirm that there is that fact. Science always runs after these things; it does not try to explain the phenomena. Science cannot establish a religious truth. A religious truth is essentially an experience, it is not an opinion. Religion is an absolute experience. A religious experience is absolute, it cannot be discussed. For instance, when somebody has had a religious experience, he just has such an experience, and nothing can take it away from him.

Mr. Hopkins:

[693] In the nineteenth century the scientists were apt to be much more dogmatic than they are now. They dismissed all religion as an illusion. But now they admit it, and they experience it themselves.

Professor Jung:

[694] Our science is phenomenology. In the nineteenth century science was labouring under the illusion that science could establish a truth. No science can establish a truth.

Mr. Hopkins:

[695] But it is the science of the nineteenth century that the ordinary people have today. That is our problem.

Professor Jung:

[696] Yes, you are up against it. It has filtered down into the lower strata of the population, and has worked no end of evil. When the asses catch hold of science, that is awful. Those are the great mental epidemics of our time; they are all insane, the whole crowd!

IV

ON OCCULTISM

(related to Volume I of the Collected Works)

ON SPIRITUALISTIC PHENOMENA[1]

[697] It is impossible, within the short space of a lecture, to say anything fundamental about such a complicated historical and psychological problem as spiritualism[1a] appears to be. One must content oneself with shedding a little light on one or the other aspect of this intricate question. This kind of approach will at least give the hearer an approximate idea of the many facets of spiritualism. Spiritualism, as well as being a theory (its advocates call it “scientific”), is a religious belief which, like every religious belief, forms the spiritual core of a religious movement. This sect believes in the actual and tangible intervention of a spiritual world in our world, and consequently makes a religious practice of communicating with the spirits. The dual nature of spiritualism gives it an advantage over other religious movements: not only does it believe in certain articles of faith that are not susceptible of proof, but it bases its belief on a body of allegedly scientific, physical phenomena which are supposed to be of such a nature that they cannot be explained except by the activity of spirits. Because of its dual nature—on the one side a religious sect, on the other a scientific hypothesis—spiritualism touches upon widely differing areas of life that would seem to have nothing in common.

[698] Spiritualism as a sect originated in America in the year 1848. The story of its origin is a strange one.[2] Two girls of the Methodist family Fox, in Hydesville, near Rochester (New York), were frightened every night by sounds of knocking. At first a great scandal arose, because the neighbours suspected that the devil was up to his usual tricks. Gradually, however, communication was established with the knocking sounds when it was discovered that questions were answered with a definite number of knocks. With the help of a knocking alphabet, it was learned that a man had been murdered in the Foxes’ house, and his body buried in the cellar. Investigations were said to have confirmed this.

[699] Thus far the report. The public performances given by the Foxes with the poltergeists were quickly followed by the founding of other sects. Tableturning, much practised earlier, was taken up again. Numerous mediums were sought and found, that is, persons in whose presence such phenomena as knocking noises occurred. The movement spread rapidly to England and the continent. In Europe, spiritualism took the form chiefly of an epidemic of tableturning. There was hardly an evening party or dance where the guests did not steal away at a late hour to question the table. This particular symptom of spiritualism was rampant everywhere. The religious sects made less headway, but they continued to grow steadily. In every big city today there is a fairly large community of practising spiritualists.

[700] In America, which swarms with local religious movements, the rise of spiritualism is understandable enough. With us, its favourable reception can be explained only by the fact that the ground had been historically prepared. The beginning of the nineteenth century had brought us the Romantic Movement in literature, a symptom of a widespread, deep-seated longing for anything extraordinary and abnormal. People adored wallowing in Ossianic emotions, they went crazy over novels set in old castles and ruined cloisters. Everywhere prominence was given to the mystical, the hysterical; lectures about life after death, about sleepwalkers and visionaries, about animal magnetism and mesmerism, were the order of the day. Schopenhauer devoted a long chapter to all these things in his *Parerga und Paralipomena*, and he also spoke of them at various places in his *chef d'œuvre*.[3] Even his important concept of "sanctity" is a far-fetched, mystico-aesthetic ideal. Similar movements made themselves felt in the Catholic church, clustering round the strange figure of Johan Joseph von Görres 1776–1848. Especially significant in this respect is his four-volume work *Die christliche Mystik*, Regensburg, 1836–42,. The same trends appear in his earlier book. *Emanuel Swedenborg, seine Visionen und sein Verhältnis zur Kirche*, Speyer 1827,. The Protestant public raved about the soulful poetry of Justinus Kerner and his clairvoyante, Frau Friederike Hauffe, while certain theologians gave vent to their catholicizing tendencies by excommunicating spirits. From this period, too, come a large number of

remarkable psychological descriptions of abnormal people—ecstatics, somnambulists, sensitives. They were much in demand and were cultivated assiduously. A good example was Frau Hauffe herself, the clairvoyante of Prevorst, and the circle of admirers who gathered round her. Her Catholic counterpart was Katharina Emmerich, the ecstatic nun of Dulmen. Reports of similar personalities were collected together in a weighty tome by an anonymous savant, entitled “The Ecstatic Virgins of the Tyrol. Guiding Stars in the Dark Firmament of Mysticism.”[4]

[701] When these strange personages were investigated, the following suprasensible processes were observed:

1. “Magnetic” phenomena.
2. Clairvoyance and prophecy.
3. Visions.

[702] 1. *Animal magnetism*, as understood at the beginning of the nineteenth century, covered a vaguely defined area of physiological and psychological phenomena which, it was thought, could all be explained as “magnetic.” “Animal magnetism” had been in the air ever since the brilliant experiments of Franz Anton Mesmer. It was Mesmer who discovered the art of putting people to sleep by light passes of the hand. In some people this sleep was like the natural one, in others it was a “waking sleep”; that is, they were like sleepwalkers, only part of them was asleep, while some senses remained awake. This half-sleep was also called “magnetic sleep” or somnambulism. People in these states were wholly under the will of the magnetist, they were “magnetized” by him. Today, as we know, there is nothing wonderful about these states; they are known as hypnosis and we use the mesmeric passes as a valuable adjunct to other methods of suggestion. The significance attributed to the passes quickly led to their being grossly overestimated. People thought that some vitalistic force had been discovered; they spoke of a “magnetic fluid” that streamed from the magnetist into the patient and destroyed the diseased tissue. They also used it to explain the movements of the table in tableturning, imagining that the table was vitalized by the laying on of hands and could therefore move about like a living thing. The phenomena of the divining rod and the automatically swinging pendulum

were explained in the same way. Even completely crazy phenomena of this sort were widely reported and believed. Thus the *Neue Preussische Zeitung* reported from Barmen, in Pomerania that a party of seven persons sat themselves round a table in a boat, and magnetized it. “In the first 20 minutes the boat drifted 50 feet downstream. Then it began to turn, with steadily increasing speed, until the rotary movement had carried it through an arc of 180 degrees in 3 minutes. Eventually, by skilful manipulation of the rudder, the boat moved forwards, and the party travelled half a mile upstream in 40 minutes, but on the return journey covered the same distance in 26 minutes. A crowd of spectators, watching the experiment from the banks of the river, received the ‘table travellers’ with jubilation.” In very truth, a mystical motorboat! According to the report, the experiment had been suggested by a Professor Nägeli, of Freiburg im Breisgau.

[703] Experiments in divination are known from the grey dawn of history. Thus Ammianus Marcellinus reports from A.D. 371 that a certain Patricius and Hilarius, living in the reign 364–78 of the Emperor Valens, had discovered by the “abominable arts of soothsaying” who would succeed to the throne. For this purpose they used a metal bowl, with the alphabet engraved round the rim. Over it amid fearful oaths, they suspended a ring on a thread. This began to swing, and spelt out the name Theodorus. When their magic was divulged, they were arrested and put to death.

[704] Ordinarily, experiments with the automatic movements of the table, the divining rod and the pendulum are not as bizarre as the first example or as dangerous as the second. The various phenomena that may occur in tableturning have been described in a treatise by Justinus Kerner bearing the significant title: “The Somnambulant Tables. A History and Explanation of these Phenomena”[5], 1853,. They have also been described by the late Professor Thury of Geneva, in *Les Tables parlantes au point de vue de la physique générale*, 1855,.

[705] *Clairvoyance and prophecy* are further characteristics of somnambulists. Clairvoyance in time and space plays a large role in the biographies and descriptions of these cases. The literature abounds in more or less credible reports, most of which have been collected by

Gurney, Myers, and Podmore in their book *Phantasms of the Living*, 1886,.

[706] An excellent example of clairvoyance is preserved for us in philosophical literature and is especially interesting because it was personally commented on by Kant. In an undated letter to Charlotte von Knobloch, he wrote as follows about the spirit-seer Swedenborg:[6]

[707] The following occurrence appears to me to have the greatest weight of proof, and to place the assertion respecting Swedenborg's extraordinary gift beyond all possibility of doubt.

[708] In the year 1759, towards the end of September, on Saturday at four o'clock p.m., Swedenborg arrived at Gottenburg from England, when Mr. William Castel invited him to his house, together with a party of fifteen persons. About six o'clock Swedenborg went out, and returned to the company quite pale and alarmed. He said that a dangerous fire had just broken out in Stockholm, at the Södermalm (Gottenburg is about fifty German miles from Stockholm), and that it was spreading very fast. He was restless, and went out often. He said that the house of one of his friends, whom he named, was already in ashes, and that his own was in danger. At eight o'clock, after he had been out again, he joyfully exclaimed, 'Thank God! the fire is extinguished; the third door from my house.' This news occasioned great commotion throughout the whole city, but particularly amongst the company in which he was. It was announced to the Governor the same evening. On Sunday morning Swedenborg was summoned to the Governor who questioned him concerning the disaster. Swedenborg described the fire precisely, how it had begun and in what manner it had ceased, and how long it had continued. On the same day the news spread through the city, and as the Governor thought it worthy of attention, the consternation was considerably increased; because many were in trouble on account of their friends and property, which might have been involved in the disaster. On Monday evening a messenger arrived at Gottenburg, who was despatched by the Board of Trade during the time of the fire. In the letters brought by him, the fire was described precisely in the manner stated by Swedenborg. On Tuesday morning the Royal Courier arrived at the Governor's with the melancholy intelligence of the fire, of the loss which

it had occasioned, and of the houses it had damaged and ruined, not in the least differing from that which Swedenborg had given at the very time when it happened; for the fire was extinguished at eight o’clock.

[709] What can be brought forward against the authenticity of this occurrence (the conflagration in Stockholm)? My friend who wrote this to me has examined all, not only in Stockholm, but also, about two months ago, in Gottenburg, where he is well acquainted with the most respectable houses, and where he could obtain the most authentic and complete information, for as only a very short time had elapsed since 1759 most of the inhabitants are still alive who were eyewitnesses of this occurrence.

[710] *Prophecy* is a phenomenon so well known from the teachings of religion that there is no need to give any examples.

[711] 3. *Visions* have always figured largely in miraculous tales, whether in the form of a ghostly apparition or an ecstatic vision. Science regards visions as delusions of the senses, or hallucinations. Hallucinations are very common among the insane. Let me cite an example from the literature of psychiatry:

[712] A twenty-four-year-old servant girl, with an alcoholic father and a neurotic mother, suddenly begins falling into peculiar states. From time to time she falls into a state of consciousness in which she sees everything that comes into her mind vividly before her, as though it were there in reality. All the time the images keep changing with breathtaking speed and lifelikeness. The patient, who in actual life is nothing but a simple country girl, then resembles an inspired seer. Her features become transfigured, her movements flow with grace. Famous figures pass before her mind’s eye. Schiller appears to her in person and plays with her. He recites his poems to her. Then she herself begins to recite, improvising in verse the things she has read, experienced, and thought. Finally she comes back to consciousness tired and exhausted, with a headache and a feeling of oppression, and with only an indistinct memory of what has happened. At other times her second consciousness has a sombre character. She sees ghostly figures prophesying disaster, processions of spirits, caravans of strange and terrifying beastlike forms, her own body being buried, etc.[7]

[713] Visionary ecstasies are usually of this type. Numerous visionaries are known to us from history, among them many of the Old Testament prophets. There is the report of St. Paul's vision on the road to Damascus, followed by a blindness that ceased at the psychological moment. This blindness reminds us on the one hand of the blindness which can be produced by suggestion, and on the other hand of the blindness which occurs spontaneously with certain hysterical patients and again disappears at a suitable psychological moment. The best visions, and the ones that are psychologically the most transparent, are found in the legends of the saints, the visions being most colourful in the case of female saints experiencing the heavenly marriage. An outstanding visionary type was the Maid of Orleans, who was unconsciously imitated by the devout dreamer Thomas Ignaz Martin at the time of Louis XVIII.[8]

[714] Swedenborg, a learned and highly intelligent man, was a visionary of unexampled fertility. His importance is attested by the fact that he had a considerable influence on Kant.[9]

[715] These remarks are not meant to be conclusive, they are only intended to sketch in broad outline the state of knowledge at that time and its mystical tendency. They give some idea of the psychological premises which explain the rapid spread of American spiritualism in Europe. The tableturning epidemic of the fifties has already been mentioned. It reached a climax in the sixties and seventies. In Paris, spiritualistic séances were held at the court of Napoleon III. Famous and sometimes infamous mediums appeared—Cumberland, the Davenport brothers, Home, Slade, Miss Cook. This was the real heyday of spiritualism, for these mediums produced marvellous phenomena, quite extraordinary things which went so far beyond the bounds of credibility that a thinking person who was not himself an eyewitness could only treat them with scepticism. The impossible happened: human bodies, and parts of bodies, materialized out of thin air, bodies that had an intelligence of their own and declared themselves to be the spirits of the dead. They complied with the doubting requests of the worldlings and even submitted to experimental conditions; on vanishing from this world, they left behind pieces of their white gauzy robes, prints of their hands and feet,

handwriting on the inner side of two slates sealed together, and, finally, even let themselves be photographed.

[716] But the full impact of these tidings, impressive as they were, was not felt until the famous English physicist, William Crookes, in his *Quarterly Journal of Science*, presented to the world a report on the observations he had made during the past eight years, which had convinced him of the reality of the phenomena in question. Since the report is concerned with observations at which none of us was present, under conditions which it is no longer possible to check, we have no alternative but to let the observer himself inform us how these observations were mirrored in his brain. The tone of the report at least allows us to surmise the state of his feelings at the time of writing. I shall therefore cite verbatim a passage from his investigations during the years 1870–73:[10]

CLASS VI

The Levitation of Human Beings

[717] This has occurred in my presence on four occasions in darkness. The test conditions under which they took place were quite satisfactory, so far as the judgment was concerned: but ocular demonstration of such a fact is so necessary to disturb our preformed opinions as to "the naturally possible and impossible,"' that I will here only mention cases in which the deductions of reason were confirmed by the sense of sight.

[718] On one occasion I witnessed a chair, with a lady sitting on it, rise several inches from the ground. On another occasion, to avoid the suspicion of this being in some way performed by herself, the lady knelt on the chair in such manner that its four feet were visible to us. It then rose about three inches, remained suspended for about ten seconds, and then slowly descended. At another time two children, on separate occasions, rose from the floor with their chairs, in full daylight, under (to me) most satisfactory conditions; for I was kneeling and keeping close watch upon the feet of the chair, and observing that no one might touch them.

[719] The most striking cases of levitation which I have witnessed have been with Mr. Home. On three separate occasions have I seen him raised completely from the floor of the room. Once sitting in an easy chair, once kneeling on his chair, and once standing up. On each occasion I had full opportunity of watching the occurrence as it was taking place.

[720] There are at least a hundred recorded instances of Mr. Home's rising from the ground, in the presence of as many separate persons, and I have heard from the lips of the three witnesses to the most striking occurrence of this kind—the Earl of Dunraven Lord Lindsay, and Captain C. Wynne—their own most minute accounts of what took place. To reject the recorded evidence on this subject is to reject all human testimony whatever; for no fact in sacred or profane history is supported by a stronger array of proofs.

[721] The accumulated testimony establishing Mr. Home's levitations is overwhelming. It is greatly to be desired that some person, whose evidence would be accepted as conclusive by the scientific world—if indeed there lives a person whose testimony *in favour* of such phenomena would be taken—would seriously and patiently examine these alleged facts. Most of the eye-witnesses to these levitations are now living, and would, doubtless, be willing to give their evidence. But, in a few years, such *direct* evidence will be difficult, if not impossible, to be obtained.

[722] It is obvious from the tone of this passage that Crookes was completely convinced of the reality of his observations. I refrain from further quotations because they would not tell us anything new. It is sufficient to remark that Crookes saw pretty well everything that occurred with these great mediums. It is hardly necessary to stress that if this unprecedented happening is an actual fact, the world and science have been enriched by an experience of the most tremendous importance. For a variety of reasons, it is not possible to criticize Crookes's powers of apprehension and retention during those years from the psychiatric point of view. We only know that at that time Crookes was not manifestly insane. Crookes and his observations must remain for the present an unsolved psychological enigma. The same is true of a number of other observers whose intelligence and honesty one does not wish to disparage

without good reason. Of numerous other observers, noted for their prejudices, lack of criticism, and exuberant imagination, I shall say nothing: they are ruled out from the start.

[723] One does not have to be particularly beset by doubts as to whether our knowledge of the world in the twentieth century has really attained the highest possible peak to feel humanly touched by this forthright testimony of an eminent scholar. But, in spite of our sympathy, we may leave out of account the question of the physical reality of such phenomena, and instead turn our attention to the psychological question: how does a thinking person, who has shown his sober-mindedness and gift for scientific observation to good advantage in other fields, come to assert that something inconceivable is a reality?

[724] This psychological interest of mine has prompted me to keep track of persons who are gifted as mediums. My profession as a psychiatrist gave me ample opportunities for this, particularly in a city like Zurich. So many remarkable elements converging in so small a space can perhaps be found nowhere else in Europe. In the last few years I have investigated eight mediums, six of them women and two of them men. The total impression made by these investigations can be summed up by saying that one must approach a medium with a minimum of expectations if one does not want to be disappointed. The results are of purely psychological interest, and no physical or physiological novelties came to light. Everything that may be considered a scientifically established fact belongs to the domain of the mental and cerebral processes and is fully explicable in terms of the laws already known to science.

[725] All phenomena which the spiritualists claim as evidence of the activity of spirits are connected with the presence of certain persons, the mediums themselves. I was never able to observe happenings alleged to be “spiritual” in places or on occasions when no medium was present. Mediums are as a rule slightly abnormal mentally. Frau Rothe, for example, although she could not be declared *non compos mentis* by forensic psychiatrists, nevertheless exhibited a number of hysterical symptoms. Seven of my mediums showed slight symptoms of hysteria (which, incidentally, are extraordinarily common in other walks of life too). One medium was an American swindler whose abnormality

consisted chiefly in his impudence. The other seven acted in good faith. Only one of them, a woman of middle age, was born with her gifts; she had suffered since earliest childhood from alterations of consciousness (frequent and slightly hysterical twilight states). She made a virtue of necessity, induced the change of consciousness herself by auto-suggestion, and in this state of auto-hypnosis was able to prophesy. The other mediums discovered their gift only through social contacts and then cultivated it at spiritualistic séances, which is not particularly difficult. One can, with a few skillful suggestions, teach a remarkably high percentage of people, especially women, the simple spiritualistic manipulations, table-turning for instance, and, less commonly, automatic writing.

[726] The ordinary phenomena met with in mediums are table-turning, automatic writing, and speaking in a trance.

[727] Table-turning consists in one or more persons laying their hands on a table that can move easily. After a time-a couple of minutes to an hour) the table begins to move, making turning or rocking movements. This phenomenon can be observed in the case of all objects that are touched. The automatically swinging pendulum and the divining rod are based on the same principle. It was, then, a very childish hypothesis to assume, as in earlier decades, that the objects touched moved of themselves, like living things. If a fairly heavy object is chosen, and one feels the arm muscles of the medium while the object is moving, the muscular tension is immediately apparent, and hence also the effort of the medium to move the object. The only remarkable thing is that the mediums assert they feel nothing of this effort, but, on the contrary, have a definite feeling that the object is moving of its own accord, or else that their arm or hand is moved for them. This psychological phenomenon is strange only to people who know nothing of hypnosis. A hypnotized person can be told that, on waking, he will forget everything that happened under the hypnosis, but that at a certain sign he will, without knowing why, suddenly raise his right arm. Sure enough, on waking, he has forgotten everything; at the sign he raises his right arm, without knowing why—his arm “simply rose up in the air of its own accord.”

[728] Spontaneous phenomena can occasionally be observed in hysterics, for instance the paralysis or peculiar automatic movements of an arm. Either the patients cannot give the reasons for these sudden symptoms, or they give the wrong reasons; for instance, the symptom came from their having caught cold, or from over-strain. One has only to hypnotize the patient in order to discover the real reason and the significance of the symptom. For instance, a young girl wakes up in the morning to find that her right arm is paralysed. She rushes in terror to the doctor and tells him she doesn’t know how it happened, she must obviously have overstrained herself doing the housework the day before. That is the only reason she can think of. Under hypnosis it turns out that the day before she had a violent quarrel with her parents, and that her father grabbed her by the right arm and pushed her out of the door. The paralysis of the arm is now clear; it is connected with the unconscious memory of yesterday’s scene, which was not present in her waking consciousness. (The existence of “unconscious ideas” is discussed in my paper “The Reaction-time Ratio in the Association Experiment.”[11])

[729] It is evident from these facts that our bodies can easily execute automatic movements whose cause and origin are not known to us. And if science had not drawn our attention to it, we would not know, either, that our arms and hands are constantly making slight movements, called “intended tremors,” which accompany our thoughts. If, for instance, one vividly imagines a simple geometrical figure, a triangle, say, the tremors of the outstretched hand will also describe a triangle, as can be demonstrated very easily by means of a suitable apparatus. Hence, if we sit down at the table with a lively expectation of automatic movements, the intended tremors will reflect this expectation and gradually cause the table to move. But once we have felt the apparently automatic movement, we are immediately convinced that “the thing works.” The conviction suggestion clouds our judgment and observation, so that we do not notice how the tremors, very slight at first, gradually build up into muscular contractions which then naturally produce stronger and stronger and still more convincing effects.

[730] Now if an ordinary table, whose simple construction we know, can execute movements apparently of its own accord and behave as if it were

alive, then human fantasy is quite ready to believe that the cause of the movement is some mystic fluid or even the spirits of the air. And if, as usually happens, the table composes sentences with an intelligible content out of the letters of the alphabet, then it seems proved beyond a doubt that an "alien intelligence" is at work. We know, however, that the initial, automatic tremors are in large measure dependent on our ideas. If they are capable of moving the table, they can equally well guide its movements in such a way that they construct words and sentences out of the alphabet. Nor is it necessary to visualize the sentence beforehand. The unconscious part of the psyche which controls the automatic movements very soon causes an intellectual content to flow into them.[12] As might be expected, the intellectual content is as a rule on a very low level and only in exceptional cases exceeds the intelligence of the medium. A good example of the poverty of "table-talking" is given in Allan Kardec's *Buch der Medien.*

[731] Automatic writing" follows the same principles as table-turning. The content of the writing is in no way superior to that of "table-talking." The same considerations apply to talking in a trance or ecstasy. Instead of the muscles of the arm and hand, it is the muscles of the speech apparatus that start functioning independently. The content of trance communications is naturally on the same level as the products of the other automatisms.

[732] These phenomena are statistically the ones most commonly observed in mediums. Clairvoyance is much rarer. Only two of my mediums had the reputation of being clairvoyant. One of them is a well-known professional, who has already made a fool of herself in various cities in Switzerland. In order to assess her mental state as fairly as possible. I had nearly thirty sittings with her over a period of six months. The results of the investigation, so far as clairvoyance is concerned, can be put very briefly: nothing that quite unquestionably exceeded the normal psychological capacities was observed. On the other hand, she did in some instances display a remarkably fine gift for unconscious combination. She could combine "petites perceptions" and guesses and evaluate them in a very skilful way, mostly in a state of slight clouding of

consciousness. There is nothing supernatural about this state; on the contrary, it is a well-known subject of psychological research.

[733] How delicate is the capacity for unconscious apprehension could be demonstrated experimentally with my second medium. The experiments were conducted as follows. The medium sat opposite me at a small table that stood on a thick soft carpet (to assist greater mobility). Both of us laid our hands on the table. While the medium's mind was occupied by her engaging in conversation with a third person, I thought intensively of a number between 0 and 10—for instance, 3. The arrangement was that the table had to indicate the number thought of by the same number of tilts. The fact that the number was indicated correctly each time when I kept my hands on the table throughout the experiment is not remarkable. What is remarkable is that in 77 per cent of the cases the correct number was also given when I removed my hands immediately after the first tilt. If my hands did not touch the table at all, there were no correct scores. The results of numerous experiments showed that by means of intended tremors it is possible to communicate a number between 0 and 10 to another person, in such a way that though this person could not recognize the number, he could nevertheless reproduce it by automatic movements. I was able to establish to my satisfaction that the conscious mind of the medium never had any inkling of the number I had communicated. Numbers above 10 were reproduced very uncertainly, sometimes only one of the numerals being given. If I thought of the numbers in Roman instead of Arabic numerals, the results were considerably worse. The aforesaid 77 per cent correct scores applies only to experiments with Arabic numerals. From this one can conclude that my unconscious movements must have communicated a pictorial image of the numbers. The more complicated and less customary images of Roman numerals fared worse, as was also the case with numbers above 10.

[734] I cannot report these experiments without recalling a curious and instructive observation I made one day when all the psychological experiments with the medium went wrong. Even the experiments with numbers failed to come off, until I finally hit on the following expedient: In an experiment conducted along much the same lines. I told the medium that the number I was thinking of 3 was between 2 and 5. I then

got the table to answer me a dozen times. The numbers it reproduced with iron consistency were 2, 4, and 5, but never 3; thus indicating, negatively but quite clearly, that the table, or rather the unconscious of the medium, was well aware of the number I was thinking of and avoided it out of mere caprice. The capriciousness of the unconscious is something the spiritualists could tell us a good deal about, only in their language it would be said that the good spirits had been supplanted by mischievous mocking spirits who had ruined the experiment.

[735] The sensitive apprehension of the unconscious, shown by its capacity to translate another person's tremors into numbers, is a striking but by no means unprecedented fact. There are numerous corroborative examples in the scientific literature. But if the unconscious, as my experiments prove, is capable of registering and reproducing something without the conscious mind knowing anything about it, then the greatest caution is necessary in evaluating clairvoyant performances. Before we jump to the conclusion that thought flies through time and space detached from the brain, we should seek to discover by meticulous psychological investigation the hidden sources of the apparently supernatural knowledge.

[736] On the other hand, any unprejudiced investigator will readily admit that we do not stand today on the pinnacle of all wisdom, and that nature still has infinite possibilities up her sleeve which may be revealed in happier days to come. I shall therefore confine myself to pointing out that the cases I observed of supposed clairvoyance might easily be explained in another and more intelligible way than by the assumption of mystic powers of cognition. The apparently inexplicable cases of clairvoyance I know only by hearsay, or have read of in books.

[737] The same is true of that other great class of spiritualistic manifestations, the *physical* phenomena. Those I saw were reputed to be such, but in fact were not. Generally speaking, among the countless believers in miracles of our days very few will be found who have ever seen anything manifestly supernatural. And among these few there will be still fewer who do not suffer from an overheated imagination and do not replace critical observation by faith. Nevertheless, we are left with a

residue of witnesses who ought not to be cavilled at. Among these I would include Crookes.

[738] All human beings are bad observers of things that are unfamiliar to them. Crookes, too, is a human being. There is no universal gift for observation that could claim a high degree of certainty without special training. Human observation achieves something only when trained in a definite field. Take a sensitive observer away from his microscope and turn his attention to wind and weather, and he is more helpless than any hunter or peasant. If we plump a good physicist down in the deceptive, magical darkness of a spiritualistic séance, with hysterical mediums plying their trade with all the incredible refinement many of them have at their command, his observation will be no more acute than a layman's. Everything will then depend on the strength of his prejudice for or against. In this respect the psychic disposition of a man like Crookes would be worth investigating. If as a result of environmental influence and education, or his innate temperament, he is not disinclined to believe in miracles, he will be convinced by the apparition. But if he is disinclined from the start to believe in miracles, he will remain unconvinced in spite of the apparition, just as did many other people who witnessed similar things with the same medium.

[739] Human observation and reporting are subject to disturbance by countless sources of error, many of which are still quite unknown. For instance, a whole school of experimental psychology is now studying the "psychology of evidence," that is, the problem of observation and reporting. Professor William Stern,[13] the founder of this school, has published experiments which show man's powers of observation in a bad light. And yet Stern's experiments were conducted on educated people! It seems to me that we must go on working patiently for a few more years in the direction of the Stern school before we tackle the difficult question of the reality of spiritualistic phenomena.

[740] So far as the miraculous reports in the literature are concerned, we should, for all our criticism, never lose sight of the limitations of our knowledge, otherwise something embarrassingly human might happen, making us feel as foolish as the academicians felt over Chladni's meteors,[14] or the highly respected Bavarian Board of Physicians over the

railway.[15] Nevertheless I believe that the present state of affairs gives us reason enough to wait quietly until more impressive physical phenomena put in an appearance. If, after making allowance for conscious and unconscious falsification, self-deception, prejudice, etc., we should still find something positive behind them, then the exact sciences will surely conquer this field by experiment and verification, as has happened in every other realm of human experience. That many spiritualists brag about their “science” and “scientific knowledge” is, of course, irritating nonsense. These people are lacking not only in criticism but in the most elementary knowledge of psychology. At bottom they do not want to be taught any better, but merely to go on believing—surely the naïvest of presumptions in view of our human failings.

FOREWORD TO JUNG: “PHÉNOMÈNES OCCULTES”[1]

[741] The essays collected together in this little volume were written over a period of thirty years, the first in 1902 and the last in 1932. The reason why I am bringing them out together is that all three are concerned with certain borderline problems of the human psyche, the question of the soul’s existence after death. The first essay gives an account of a young somnambulistic girl who claimed to be in communication with the spirits of the departed. The second essay deals with the problem of dissociation and “part-souls” (or splinter-personalities). The third discusses the psychology of the belief in immortality and the possibility of the continued existence of the soul after death.

[742] The point of view I have adopted is that of modern empirical psychology and the scientific method. Although these essays deal with subjects which usually fall within the province of philosophy or theology, it would be a mistake to suppose that psychology is concerned with the *metaphysical* nature of the problem of immortality. Psychology cannot establish any metaphysical “truths,” nor does it try to. It is concerned solely with the *phenomenology of the psyche*. The idea of immortality is a psychic phenomenon that is disseminated over the whole earth. Every “idea” is, from the psychological point of view, a phenomenon, just as is “philosophy” or “theology.” For modern psychology, ideas are *entities*, like animals and plants. The scientific method consists in the description of nature. All mythological ideas are *essentially real*, and far older than any philosophy. Like our knowledge of physical nature, they were originally perceptions and experiences. In so far as such ideas are universal, they are symptoms or characteristics or normal exponents of psychic life, which are *naturally* present and need no proof of their “truth.” The only question we can profitably discuss is whether they are universal or not. If they are universal, they belong to the natural constituents and normal structure of the psyche. And if by any chance they are not encountered in the conscious mind of a given individual,

then they are present in the unconscious and the case is an abnormal one. The fewer of these universal ideas are found in consciousness, the more of them there will be in the unconscious, and the greater will be their influence on the conscious mind. This state of things already bears some resemblance to a neurotic disturbance.

[743] It is normal to think about immortality, and abnormal not to do so or not to bother about it. If everybody eats salt, then that is the normal thing to do, and it is abnormal not to. But this tells us nothing about the "rightness" of eating salt or of the idea of immortality. That is a question which strictly speaking has nothing to do with psychology. Immortality cannot be proved any more than can the existence of God, either philosophically or empirically. We know that salt is indispensable for our physiological health. We do not eat salt for this reason, however, but because food with salt in it tastes better. We can easily imagine that long before there was any philosophy human beings had instinctively found out what ideas were necessary for the normal functioning of the psyche. Only a rather stupid mind will try to go beyond that, and to venture an opinion on whether immortality does or does not exist. This question cannot be asked for the simple reason that it cannot be discussed. More important, it misses the essential point, which is the functional value of the idea as such.

[744] If a person does not "believe" in salt, it is up to the doctor to tell him that salt is necessary for physiological health. Equally, it seems to me that the doctor of the soul should not go along with the fashionable stupidities but should remind his patient what the normal structural elements of the psyche are. For reasons of psychic hygiene, it would be better not to forget these original and universal ideas; and wherever they have disappeared, from neglect or intellectual bigotry, we should reconstruct them as quickly as we can regardless of "philosophical" proofs for or against (which are impossible anyway). In general, the heart seems to have a more reliable memory for what benefits the psyche than does the head, which has a rather unhealthy tendency to lead an "abstract" existence, and easily forgets that its consciousness is snuffed out the moment the heart fails in its duty.

[745] Ideas are not just counters used by the calculating mind; they are also golden vessels full of living feeling. “Freedom” is not a mere abstraction, it is also an emotion. Reason becomes unreason when separated from the heart, and a psychic life void of universal ideas sickens from undernourishment. The Buddha said: “These four are the foodstuffs, ye bhikkus, which sustain the creatures that are born, and benefit the creatures that seek rebirth. The first is edible food, coarse or fine; touch is the second; the thinking capacity of the mind is the third; and the fourth is consciousness.”[2]

PSYCHOLOGY AND SPIRITUALISM[1]

[746] The reader should not casually lay this book aside on discovering that it is about "Invisibles," that is to say about spirits, on the assumption that it belongs to the literature of spiritualism. One can very well read the book without resorting to any such hypothesis or theory, and take it simply as a report of psychological facts or a continuous series of communications from the unconscious—which is, indeed, what it is really about. Even spirits appear to be psychic phenomena whose origins lie in the unconscious. At all events, the "Invisibles" who are the source of information in this book are shadowy personifications of unconscious contents, conforming to the rule that activated portions of the unconscious assume the character of *personalities* when they are perceived by the conscious mind. For this reason, the voices heard by the insane seem to belong to definite personalities who can often be identified, and personal intentions are attributed to them. And in fact, if the observer is able—though this is not always easy—to collect together a fair number of these verbal hallucinations, he will discover in them something very like motives and intentions of a personal character.

[747] The same is true to an even greater degree of the "controls" in mediumistic séances who make the "communications." Everything in our psyche has to begin with a personal character, and one must push one's investigations very far before one comes across elements that are no longer personal. The "I" or "we" of these communications has a merely grammatical significance and is never proof of the existence of a spirit, but only of the physical presence of the medium or mediums. In dealing with "proofs of identity," such as are offered in this book, one must remember that proofs of this kind would seem to be theoretically impossible considering the enormous number of possible sources of error. We know for a certainty that the unconscious is capable of subliminal perceptions and is a treasure house of lost memories. In addition, it has been proved by experiment that time and space are

relative for the unconscious, so that unconscious perception, not being impeded by the space-time barrier, can obtain experiences to which the conscious mind has no access. In this connection I would refer to the experiments conducted at Duke University and other places.[2]

[748] Considering all this, the proof of identity seems to be a forlorn hope, in theory anyway. In practice, however, things are rather different because cases actually occur which are so overwhelmingly impressive that they are absolutely convincing to those concerned. Even though our critical arguments may cast doubt on every single case, there is not a single argument that could prove that spirits do not exist. In this regard, therefore, we must rest content with a "non liquet." Those who are convinced of the reality of spirits should know that this is a subjective opinion which can be attacked on any number of grounds. Those who are not convinced should beware of naïvely assuming that the whole question of spirits and ghosts has been settled and that all manifestations of this kind are meaningless swindles. This is not so at all. These phenomena exist in their own right, regardless of the way they are interpreted, and it is beyond all doubt that they are genuine manifestations of the unconscious. The communications of "spirits" are *statements about the unconscious psyche*, provided that they are really spontaneous and are not cooked up by the conscious mind. They have this in common with dreams; for dreams, too, are statements about the unconscious, which is why the psychotherapist uses them as a first-class source of information.

[749] *The Unobstructed Universe* may therefore be regarded as offering valuable information about the unconscious and its ways. It differs very favourably from the usual run of spiritualistic communications in that it eschews all edifying verbiage and concentrates instead on certain general ideas. This pleasing difference may be attributable to the happy circumstance that the real begetter of the book is the medium Betty, the deceased wife of the author. It is her "spirit" that pervades the book. We are familiar with her personality from Mr. White's earlier books,[3] and we know how great an educative influence she had on all those around her, constellating in their unconscious all the things that come to light in these communications.

[750] The educative intention behind Betty's activity does not differ essentially from the general tenor of spiritualistic literature. The "spirits" strive to develop man's consciousness and to unite it with the unconscious, and Betty, on her own admission, pursues the same aim. It is interesting to note that the beginnings of American spiritualism coincided with the growth of scientific materialism in the middle of the nineteenth century. Spiritualism in all its forms therefore has a *compensatory* significance. Nor should it be forgotten that a number of highly competent scientists, doctors, and philosophers have vouched for the truth of certain phenomena which demonstrate the very peculiar effect the psyche has upon matter. Among them were Friedrich Zöllner, William Crookes, Alfred Richet, Camille Flammarion, Giovanni Schiaparelli, Sir Oliver Lodge, and our Zurich psychiatrist Eugen Bleuler, not to mention a large number of less well-known names. Although I have not distinguished myself by any original researches in this field, I do not hesitate to declare that I have observed a sufficient number of such phenomena to be completely convinced of their reality. To me they are inexplicable, and I am therefore unable to decide in favour of any of the usual interpretations.

[751] Although I do not wish to prejudice the reader of this book, I cannot refrain from drawing attention to some of the issues it raises. What, above all, seems to me worth mentioning—especially in view of the fact that the author has no knowledge of modern psychology—is that the "Invisibles" favour an energic conception of the psyche which has much in common with recent psychological findings. The analogy is to be found in the idea of "frequency." But here we come upon a difference that should not be overlooked. For whereas the psychologist supposes that consciousness has a higher energy than the unconscious, the "Invisibles" attribute to the spirit of the departed, i.e., to a personified unconscious content) a higher "frequency" than to the living psyche. One should not, however, attach too much importance to the fact that the concept of energy is made use of in both cases, since this is a fundamental category of thought in all the modern sciences.

[752] The "Invisibles" further assert that our world of consciousness and the "Beyond" together form a single cosmos, with the result that the dead

are not in a different place from the living. There is only a difference in their "frequencies," which might be likened to the revolutions of a propeller: at low speeds the blades are visible, but at high speeds they disappear. In psychological terms this would mean that the conscious and the unconscious psyche are one, but are separated by different amounts of energy. Science can agree with this statement, although it cannot accept the claim that the unconscious possesses a higher energy since this is not borne out by experience.

[753] According to the "Invisibles," the "Beyond" is this same cosmos but without the limitations imposed on mortal man by space and time. Hence it is called "the unobstructed universe." Our world is contained in this higher order and owes its existence principally to the fact that the corporeal man has a low "frequency," thanks to which the limiting factors of space and time become operative. The world without limitations is called "Orthos," which means the "right" or "true" world. This tells us clearly enough what kind of significance is imputed to the "Beyond," though it must be emphasized that this does not imply a devaluation of our world. I am reminded of the philosophical riddle which my Arab dragon-man asked me when visiting the tombs of the Khalifs in Cairo. "Which man is the cleverer: the one who builds his house where he will be for the longest time, or the one who builds it where he will be only temporarily?" Betty is in no doubt that this limited life should be lived as fully as possible, because the attainment of maximum consciousness while still in this world is an essential condition for the coming life in "Orthos." She is thus in agreement not only with the general trend of spiritualistic philosophy, but also with Plato, who regarded philosophy as a preparation for death.

[754] Modern psychology can affirm that for many people this problem arises in the second half of life, when the unconscious often makes itself felt in a very insistent way. The unconscious is the land of dreams, and according to the primitive view the land of dreams is also the land of the dead and of the ancestors. From all we know about it, the unconscious does in fact seem to be relatively independent of space and time, nor is there anything objectionable in the idea that consciousness is surrounded by the sea of the unconscious, just as this world is contained in "Orthos."

The unconscious is of unknown extent and is possibly of greater importance than consciousness. At any rate, the role which consciousness plays in the life of primitives and primates is insignificant compared with that of the unconscious. The events in our modern world, as we see humanity blindly staggering from one catastrophe to the next, are not calculated to strengthen anyone's belief in the value of consciousness and the freedom of the will. Consciousness *should* of course be of supreme importance, for it is the only guarantee of freedom and alone makes it possible for us to avoid disaster. But this, it seems, must remain for the present a pious hope.

[755] Betty's aim is to extend consciousness as far as possible by uniting it with "Orthos." To this end it must be trained to listen to the unconscious psyche in order to bring about the collaboration of the "Invisibles." The aims of modern psychotherapy are similar: it too endeavours to compensate the onesidedness and narrowness of the conscious mind by deepening its knowledge of the unconscious.

[756] The similarity of aim should not, however, lead us to overlook a profound difference of viewpoint. The psychology of the "Betty Books" differs in no essential respect from the primitive view of the world, where the contents of the unconscious are all projected into external objects. What appears to the primitive to be a "spirit" may on a more conscious level be an abstract thought, just as the gods of antiquity turned into philosophical ideas at the beginning of our era. This primitive projection of psychological factors is common to both spiritualism and theosophy. The advantage of projection is obvious: the projected content is visibly "there" in the object and calls for no further reflection. But since the projection does bring the unconscious a bit nearer to consciousness, it is at least better than nothing. Mr. White's book certainly makes us think, but the kind of thinking it caters to is not psychological; it is mechanistic, and this is of little help when we are faced with the task of integrating projections. Mechanistic thinking is one of the many Americanisms that stamp the book as a typical product and leave one in no doubt as to its origin. But it is well worth while getting to know this side of the American psyche, for the world will hear a great deal more of it in times to come.

July 1948

FOREWORD TO MOSER: “SPUK: IRRGLAUBE ODER WAHRGLAUBE?”[1]

[757] The author has asked me for a few introductory words to her book. It gives me all the more pleasure to comply with her request as her previous book on occultism,[2] written with great care and knowledge of the subject, is still fresh in my memory. I welcome the appearance of this new book, a copiously documented collection of parapsychological experiences, as a valuable contribution to psychological literature in general. Extraordinary and mysterious stories are not necessarily always lies and fantasies. Many “ingenious, curious, and edifying tales” were known to previous centuries, among them observations whose scientific validity has since been confirmed. The modern psychological description of man as a totality had its precursors in the numerous biographical accounts of unusual people such as somnambulists and the like at the beginning of the nineteenth century. Indeed, though we owe the discovery of the unconscious to these old pre-scientific observations, our investigation of parapsychological phenomena is still in its infancy. We do not yet know the full range of the territory under discussion. Hence a collection of observations and of reliable material performs a very valuable service. The collector must certainly have courage and an unshakable purpose if he is not to be intimidated by the difficulties, handicaps, and possibilities of error that beset such an undertaking, and the reader, too, must summon up sufficient interest and patience to allow this sometimes disconcerting material to work upon him objectively, regardless of his prejudices. In this vast and shadowy region, where everything seems possible and nothing believable, one must oneself have observed many strange happenings and in addition heard, read, and if possible tested many stories by examining their witnesses in order to form an even moderately sure judgment.

[758] In spite of such advances as the founding of the British and American Society for Psychical Research and the existence of a

considerable and in part well-documented literature, a prejudice is still rampant even in the best informed circles, and reports of this kind meet with a mistrust which is only partially justified. It looks as though Kant will be proved right for a long time to come when he wrote nearly two hundred years ago: “Stories of this kind will have at any time only secret believers, while publicly they are rejected by the prevalent fashion of disbelief.”[3] He himself reserved judgment in the following words: “The same ignorance makes me so bold as to absolutely deny the truth of the various ghost stories, and yet with the common, although queer, reservation that while I doubt any one of them, still I have a certain faith in the whole of them taken together.”[4] One could wish that very many of our bigots would take note of this wise position adopted by a great thinker.

[759] I am afraid this will not come about so easily, for our rationalistic prejudice is grounded—*lucus a non lucendo*—not on reason but on something far deeper and more archaic, namely on a primitive instinct to which Goethe referred when he said in *Faust:* “Summon not the well-known throng ...” I once had a valuable opportunity to observe this instinct at work. It was while I was with a tribe on Mount Elgon, in East Africa, most of whom had never come into contact with the white man. Once, during a palaver, I incautiously uttered the word *selelteni*, which means “ghosts.” Suddenly a deathly silence fell on the assembly. The men glanced away, looked in all directions, and some of them made off. My Somali headman and the chief confabulated together, and then the headman whispered in my ear: “What did you say that for? Now you’ll have to break up the palaver.” This taught me that one must never mention ghosts on any account. The same primitive fear of ghosts is still deep in our bones, but it is unconscious. Rationalism and superstition are complementary. It is a psychological rule that the brighter the light, the blacker the shadow; in other words, the more rationalistic we are in our conscious minds, the more alive becomes the spectral world of the unconscious. And it is indeed obvious that rationality is in large measure an apotropaic defence against superstition, which is everpresent and unavoidable. The daemonic world of primitives is only a few generations away from us, and the things that have happened and still go on

happening in the dictator states teach us how terrifyingly close it is. I must constantly remind myself that the last witch was burned in Europe in the year my grandfather was born.

[760] The widespread prejudice against the factual reports discussed in this book shows all the symptoms of the primitive fear of ghosts. Even educated people who should know better often advance the most nonsensical arguments, tie themselves in knots and deny the evidence of their own eyes. They will put their names to reports of séances and then —as has actually happened more than once—withdraw their signatures afterwards, because what they have witnessed and corroborated is nevertheless impossible—as though anyone knew exactly what is impossible and what is not!

[761] Ghost stories and spiritualistic phenomena practically never prove what they seem to. They offer no proof of the immortality of the soul, which for obvious reasons is incapable of proof. But they are of interest to the psychologist from several points of view. They provide information about things the layman knows nothing of, such as the exteriorization of unconscious processes, about their content, and about the possible sources of parapsychological phenomena. They are of particular importance in investigating the localization of the unconscious and the phenomenon of synchronicity, which points to a relativation of space and time and hence also of matter. It is true that with the help of the statistical method existence of such effects can be proved, as Rhine and other investigators have done. But the individual nature of the more complex phenomena of this kind forbids the use of the statistical method, since this stands in a complementary relation to synchronicity and necessarily destroys the latter phenomenon, which the statistician is bound to discount as due to chance. We are thus entirely dependent on well observed and well authenticated individual cases. The psychologist can only bid a hearty welcome to any new crop of objective reports.

[762] The author has put together an impressive collection of factual material in this book. It differs from other collections of the kind by its careful and detailed documentation, and thus gives the reader a total impression of the situation which he often looks for in vain in other reports of this nature. Although ghosts exhibit certain universal features

they nevertheless appear in individual forms and under conditions which are infinitely varied and of especial importance for the investigator. The present collection provides the most valuable information in just this respect.

[763] The question discussed here is a weighty one for the future. Science has only just begun to take a serious interest in the human psyche and, more particularly, in the unconscious. The wide realm of psychic phenomena also includes parapsychology, which is opening undreamt-of vistas before our eyes. It is high time humanity took cognizance of the nature of the psyche, for it is becoming more and more evident that the greatest danger which threatens man comes from his own psyche and hence from that part of the empirical world we know the least about. Psychology needs a tremendous widening of its horizon. The present book is a milestone on the long road to knowledge of the psychic nature of man.

April 1950

Jung's Contribution[5]

[764] In the summer of 1920 I went to London, at the invitation of Dr. X, to give some lectures. My colleague told me that, in expectation of my visit, he had found a suitable weekend place for the summer. This, he said, had not been so easy, because every thing had already been let for the summer holidays, or else was so exorbitantly expensive or unattractive that he had almost given up hope. But finally, by a lucky change, he had found a charming cottage that was just right for us, and at a ridiculously low price. In actual fact it turned out to be a most attractive old farmhouse in Buckinghamshire, as we saw when we went there at the end of our first week of work, on a Friday evening. Dr. X had engaged a girl from the neighbouring village to cook for us, and a friend of hers would come in the afternoons as a voluntary help. The house was roomy, two-storeyed, and built in the shape of a right angle. One of these wings was quite sufficient for us. On the ground floor there was a conservatory leading into the garden; then a kitchen, dining-room, and drawing-room. On the top floor a corridor ran from the conservatory steps through the

middle of the house to a large bedroom, which took up the whole front of the wing. This was my room. It had windows facing east and west, and a fireplace in the front wall (north). To the left of the door stood a bed, opposite the fireplace a big old-fashioned chest of drawers, and to the right a wardrobe and a table. This, together with a few chairs, was all the furniture. On either side of the corridor was a row of bedrooms, which were used by Dr. X and occasional guests.

[765] The first night, tired from the strenuous work of the week, I slept well. We spent the next day walking and talking. That evening, feeling rather tired, I went to bed at 11 o'clock, but did not get beyond the point of drowsing. I only fell into a kind of torpor, which was unpleasant because I felt I was unable to move. Also it seemed to me that the air had become stuffy, and that there was an indefinable, nasty smell in the room. I thought I had forgotten to open the windows. Finally, in spite of my torpor, I was driven to light a candle: both windows were open, and a night wind blew softly through the room, filling it with the flowery scents of high summer. There was no trace of the bad smell. I remained half awake in my peculiar condition, until I glimpsed the first pale light of dawn through the east window. At this moment the torpor dropped away from me like magic, and I fell into a deep sleep from which I awoke only towards nine o'clock.

[766] On Sunday evening I mentioned in passing to Dr. X that I had slept remarkably badly the night before. He recommended me to drink a bottle of beer, which I did. But when I went to bed the same thing happened: I could not get beyond the point of drowsing. Both windows were open. The air was fresh to begin with, but after about half an hour it seemed to turn bad; it became stale and fuggy, and finally somehow repulsive. It was hard to identify the smell, despite my efforts to establish its nature. The only thing that came into my head was that there was something sickly about it. I pursued this clue through all the memories of smells that a man can collect in eight years of work at a psychiatric clinic. Suddenly I hit on the memory of an old woman who was suffering from an open carcinoma. This was quite unmistakably the same sickly smell I had so often noticed in her room.

[767] As a psychologist, I wondered what might be the cause of this peculiar olfactory hallucination. But I was unable to discover any convincing connection between it and my present state of consciousness. I only felt very uncomfortable because my torpor seemed to paralyze me. In the end I could not think any more, and fell into a torpid doze. Suddenly I heard the noise of water dripping. “Didn’t I turn off the tap properly?” I thought. “But of course, there’s no running water in the room—so it’s obviously raining—yet today was so fine.” Meanwhile the dripping went on regularly, one drop every two seconds. I imagined a little pool of water to the left of my bed. near the chest of drawers. “Then the roof must leak.” I thought. Finally, with a heroic effort, so it seemed to me, I lit the candle and went over to the chest of drawers. There was no water on the floor, and no damp spot on the plaster ceiling. Only then did I look out of the window: it was a clear, starry night. The dripping still continued. I could make out a place on the floor, about eighteen inches from the chest of drawers, where the sound came from. I could have touched it with my hand. All at once the dripping stopped and did not come back. Towards three o’clock, at the first light of dawn. I fell into a deep sleep. No—I have heard death-watch beetles. The ticking noise they make is sharper. This was a duller sound, exactly what would be made by drops of water falling from the ceiling.

[768] I was annoyed with myself, and not exactly refreshed by this weekend. But I said nothing to Dr. X. The next weekend, after a busy and eventful week. I did not think at all about my previous experience. Yet hardly had I been in bed for half an hour than everything was there as before: the torpor, the repulsive smell, the dripping. And this time there was something else: something brushed along the walls, the furniture creaked now here and now there, there were rustlings in the corners. A strange restlessness was in the air. I thought it was the wind, lit the candle and went to shut the windows. But the night was still, there was no breath of wind. So long as the light was on, the air was fresh and no noise could be heard. But the moment I blew out the candle, the torpor slowly returned, the air became fuggy, and the creakings and rustlings began again. I thought I must have noises in my ear, but at three o’clock in the morning they stopped as promptly as before.

[769] The next evening I tried my luck again with a bottle of beer. I had always slept well in London and could not imagine what could give me insomnia in this quiet and peaceful spot. During the night the same phenomena were repeated, but in intensified form. The thought now occurred to me that they must be parapsychological. I knew that problems of which people are unconscious can give rise to exteriorization phenomena, because constellated unconscious contents often have a tendency to manifest themselves outwardly somehow or other. But I knew the problems of the present occupants of the house very well, and could discover nothing that would account for the exteriorizations. The next day I asked the others how they had slept. They all said they had slept wonderfully.

[770] The third night it was even worse. There were loud knocking noises, and I had the impression that an animal, about the size of a dog, was rushing round the room in a panic. As usual, the hubbub stopped abruptly with the first streak of light in the east.

[771] The phenomena grew still more intense during the following weekend. The rustling became a fearful racket, like the roaring of a storm. Sounds of knocking came also from outside in the form of dull blows, as though somebody were banging on the brick walls with a muffled hammer. Several times I had to assure myself that there was no storm, and that nobody was banging on the walls from outside.

[772] The next weekend, the fourth, I cautiously suggested to my host that the house might be haunted, and that this would explain the surprisingly low rent. Naturally he laughed at me, although he was as much at a loss as I about my insomnia. It had also struck me how quickly the two girls cleared away after dinner every evening, and always left the house long before sundown. By eight o’clock there was no girl to be seen. I jokingly remarked to the girl who did the cooking that she must be afraid of us if she had herself fetched every evening by her friend and was then in such a hurry to get home. She laughed and said that she wasn’t at all afraid of the gentlemen, but that nothing would induce her to stay a moment in this house alone, and certainly not after sunset. “What’s the matter with it?” I asked. “Why, it’s haunted, didn’t you know? That’s the reason why it was going so cheap. Nobody’s ever stuck it here.” It had been like that as long

as she could remember. But I could get nothing out of her about the origin of the rumour. Her friend emphatically confirmed everything she had said.

[773] As I was a guest, I naturally couldn’t make further inquiries in the village. My host was sceptical, but he was willing to give the house a thorough looking over. We found nothing remarkable until we came to the attic. There, between the two wings of the house, we discovered a dividing wall, and in it a comparatively new door, about half an inch thick, with a heavy lock and two huge bolts, that shut off our wing from the unoccupied part. The girls did not know of the existence of this door. It presented something of a puzzle because the two wings communicated with one another both on the ground floor and on the first floor. There were no rooms in the attic to be shut off, and no signs of use. The purpose of the door seemed inexplicable.

[774] The fifth weekend was so unbearable that I asked my host to give me another room. This is what had happened: it was a beautiful moonlight night, with no wind; in the room there were rustlings, creakings, and hangings; from outside, blows rained on the walls. I had the feeling there was something near me, and opened my eyes. There, beside me on the pillow, I saw the head of an old woman, and the right eye, wide open, glared at me. The left half of the face was missing below the eye. The sight of it was so sudden and unexpected that I leapt out of bed with one bound, lit the candle, and spent the rest of the night in an armchair. The next day I moved into the adjoining room, where I slept splendidly and was no longer disturbed during this or the following weekend.

[775] I told my host that I was convinced the house was haunted, but he dismissed this explanation with smiling scepticism. His attitude, understandable though it was, annoyed me somewhat, for I had to admit that my health had suffered under these experiences. I felt unnaturally fatigued, as I had never felt before. I therefore challenged Dr. X to try sleeping in the haunted room himself. He agreed to this, and gave me his word that he would send me an honest report of his observations. He would go to the house alone and spend the weekend there so as to give me a “fair chance.”

[776] Next morning I left. Ten days later I had a letter from Dr. X. He had spent the weekend alone in the cottage. In the evening it was very quiet, and he thought it was not absolutely necessary to go up to the first floor. The ghost, after all, could manifest itself anywhere in the house, if there was one. So he set up his camp bed in the conservatory, and as the cottage really was rather lonely, he took a loaded shotgun to bed with him. Everything was deathly still. He did not feel altogether at ease, but nevertheless almost succeeded in falling asleep after a time. Suddenly it seemed to him that he heard footsteps in the corridor. He immediately struck a light and flung open the door, but there was nothing to be seen. He went back grumpily to bed, thinking I had been a fool. But it was not long before he again heard footsteps, and to his discomfiture he discovered that the door lacked a key. He rammed a chair against the door, with its back under the lock, and returned to bed. Soon afterwards he again heard footsteps, which stopped just in front of the door; the chair creaked, as though somebody was pushing against the door from the other side. He then set up his bed in the garden, and there he slept very well. The next night he again put his bed in the garden, but at one o’clock it started to rain, so he shoved the head of the bed under the eaves of the conservatory and covered the foot with a waterproof blanket. In this way he slept peacefully. But nothing in the world would induce him to sleep again in the conservatory. He had now given up the cottage.

[777] A little later I heard from Dr. X that the owner had had the cottage pulled down, since it was unsaleable and scared away all tenants. Unfortunately I no longer have the original report, but its contents are stamped indelibly on my mind. It gave me considerable satisfaction after my colleague had laughed so loudly at my fear of ghosts.

*

[778] I would like to make the following remarks by way of summing up. I can find no explanation of the dripping noise. I was fully awake and examined the floor carefully. I consider it out of the question that it was a delusion of the senses. As to the rustling and creaking, I think they were probably not objective noises, but noises in the ear which seemed to me to be occurring objectively in the room. In my peculiar hypnoid state they

appeared exaggeratedly loud. I am not at all sure that the knocking noises, either, were objective. They could just as well have been heartbeats that seemed to me to come from outside. My torpor was associated with an inner excitation probably corresponding to fear. Of this fear I was unconscious until the moment of the vision—only then did it break through into consciousness. The vision had the character of a hypnagogic hallucination and was probably a reconstruction of the memory of the old woman with carcinoma.

[779] Coming now to the olfactory hallucination, I had the impression that my presence in the room gradually activated something that was somehow connected with the walls. It seemed to me that the dog rushing round in a panic represented my intuition. Common speech links intuition with the nose: I had “smelt” something. If the olfactory organ in man were not so hopelessly degenerate, but as highly developed as a dog’s, I would have undoubtedly have had a clearer idea of the persons who had lived in the room earlier. Primitive medicine-men can not only smell out a thief, they also “smell” spirits and ghosts.

[780] The hypnoid catalepsy that each time was associated with these phenomena was the equivalent of intense concentration, the object of which was a subliminal and therefore “fascinating” olfactory perception. The two things together bear some resemblance to the physical and psychic state of a pointer that has picked up the scent. The source of the fascination, however, seems to me to have been of a peculiar nature, which is not sufficiently explained by any substance emitting a smell. The smell may have “embodied” a psychic situation of an excitatory nature and carried it across to the percipient. This is by no means impossible when we consider the extraordinary importance of the sense of smell in animals. It is also conceivable that intuition in man has taken the place of the world of smells that were lost to him with the degeneration of the olfactory organ. The effect of intuition on man is indeed very similar to the instant fascination which smells have for animals. I myself have had a number of experiences in which “psychic smells,” or olfactory hallucinations, turned out to be subliminal intuitions which I was able to verify afterwards.

[781] This hypothesis naturally does not pretend to explain all ghost phenomena, but at most a certain category of them. I have heard and read a great many ghost stories, and among them are a few that could very well be explained in this way. For instance, there are all those stories of ghosts haunting rooms where a murder was committed. In one case, bloodstains were still visible under the carpet. A dog would surely have smelt the blood and perhaps recognized it as human, and if he possessed a human imagination he would also have been able to reconstruct the essential features of the crime. Our unconscious, which possesses very much more subtle powers of perception and reconstruction than our conscious minds, could do the same thing and project a visionary picture of the psychic situation that excited it. For example, a relative once told me that, when stopping at a hotel on a journey abroad, he had a fearful nightmare of a woman being murdered in his room. The next morning he discovered that on the night before his arrival a woman had in fact been murdered there. These remarks are only meant to show that parapsychology would do well to take account of the modern psychology of the unconscious.

FOREWORD TO JAFFÉ: "APPARITIONS AND PRECOGNITION"[1]

[782] The author of this book has already made a name for herself by her valuable contributions to the literature of analytical psychology. Here she tells of strange tales which incur the odium of superstition and are therefore exchanged only in secret. They were lured into the light of day by a questionnaire sent out by the *Schweizerischer Beobachter*, which can thereby claim to have rendered no small service to the public. The mass of material that came in arrived first at my address. Since my age and my evergrowing preoccupation with other matters did not allow me to burden myself with further work, the task of sorting out such a collection and submitting it to psychological evaluation could not have been placed in worthier hands than those of the author. She had displayed so much psychological tact, understanding and insight in her approach to a related theme—an interpretation of E.T.A. Hoffmann's story "The Golden Pot"[2]—that I never hesitated in my choice.

[783] Curiously enough, the problem of wonder tales as they are currently told—enlightenment or no enlightenment—has never been approached from the psychological side. I naturally don't count mythology, although people are generally of the opinion that mythology is essentially history and no longer happens nowadays. As a psychic phenomenon of the present, it is considered merely a hunting-ground for economics. Nevertheless, ghost stories, warning visions, and other strange happenings are constantly being reported, and the number of people to whom something once "happened" is surprisingly large. Moreover, despite the disapproving silence of the "enlightened," it has not remained hidden from the wider public that for some time now there has been a serious science which goes by the name of "parapsychology." This fact may have helped to encourage the popular response to the questionnaire.

[784] One of the most notable things that came to light is the fact that among the Swiss, who are commonly regarded as stolid, unimaginative, rationalistic and materialistic, there are just as many ghost stories and

suchlike as, say, in England or Ireland. Indeed, as I know from my own experience and that of other investigators, magic as practised in the Middle Ages and harking back to much remoter times has by no means died out, but still flourishes today as rampantly as it did centuries ago. One doesn't speak of these things, however, They simply happen, and the intellectuals know nothing of them—for intellectuals know neither themselves nor people as they really are. In the world of the latter, without their being conscious of it, the life of the centuries lives on, and things are continually happening that have accompanied human life from time immemorial: premonitions, foreknowledge, second sight, hauntings, ghosts, return of the dead, bewitchings, sorcery, magic spells, etc.

[785] Naturally enough our scientific age wants to know whether such things are "true," without taking into account what the nature of any such proof would have to be and how it could be furnished. For this purpose the events in question must be looked at squarely and soberly, and it generally turns out that the most exciting stories vanish into thin air and what is left over is "not worth talking about." Nobody thinks of asking the fundamental question: what is the real reason why the same old stories are experienced and repeated over and over again, without losing any of their prestige? On the contrary, they return with their youthful vitality constantly renewed, fresh as on the first day.

[786] The author has made it her task to take these tales for what they are, that is, as *psychic facts*, and not to pooh-pooh them because they do not fit into our scheme of things. She has therefore logically left aside the question of truth, as has long since been done in mythology, and instead has tried to inquire into the psychological questions: Exactly *who* is it that sees a ghost? Under what psychic conditions does he see it? What does a ghost signify when examined for its content, i.e., as a symbol?

[787] She understands the art of leaving the story just as it is, with all the trimmings that are so offensive to the rationalist. In this way the *twilight atmosphere* that is so essential to the story is preserved. An integral component of any nocturnal, numinous experience is the dimming of consciousness, the feeling that one is in the grip of something greater than oneself, the impossibility of exercising criticism, and the paralysis of the will. Under the impact of the experience reason evaporates and

another power spontaneously takes control—a most singular feeling which one willy-nilly hoards up as a secret treasure no matter how much one’s reason may protest. That, indeed, is the uncomprehended purpose of the experience—to make us feel the overpowering presence of a mystery.

[788] The author has succeeded in preserving the total character of such experiences, despite the refractory nature of the reports, and in making it an object of investigation. Anyone who expects an answer to the question of parapsychological truth will be disappointed. The psychologist is little concerned here with what kind of facts can be established in the conventional sense; all that matters to him is whether a person will vouch for the authenticity of his experience regardless of all interpretations. The reports leave no doubt about this; moreover, in most cases their authenticity is confirmed by independent parallel stories. It cannot be doubted that such reports are found at all times and places. Hence there is no sufficient reason for doubting the veracity of individual reports. Doubt is justified only when it is a question of a deliberate lie. The number of such cases is increasingly small, for the authors of such falsifications are too ignorant to be able to lie properly.

[789] The psychology of the unconscious has thrown so many beams of light into other dark corners that we would expect it to elucidate also the obscure world of wonder tales eternally young. From the copious material assembled in this book those conversant with depth psychology will surely gain new and significant insights which merit the greatest attention. I can recommend it to all those who know how to value things that break through the monotony of daily life with salutary effects, (sometimes!) shaking our certitudes and lending wings to the imagination.

August 1957

V

THE PSYCHOGENESIS OF MENTAL DISEASE

(related to Volume 3 of the Collected Works)

THE PRESENT STATUS OF APPLIED PSYCHOLOGY[1]

In German Switzerland

[790] Though psychology is not taught in either Basel or Fribourg, a psychological institute has just been opened in Bern, under the direction of Professor Dürr. In the winter semester 1907 he has given a course on general psychology and another on paedagogics based on psychology, as well as an introduction to experimental psychology.

[791] As to Zurich: Professor Schumann is giving a course on Special Psychology and conducting a seminar for advanced students at the University laboratory for experimental psychology. — Privatdocent Wreschner[2] is lecturing this winter on physiology and psychology of the voice and language and conducting an introductory course (with demonstrations) on experimental psychology at the psychological laboratory. — At the psychological laboratory of the University's psychiatric clinic, established 1906, I am holding a seminar for advanced students. The programme includes normal and pathological psychology.

[792] As to associations concerned with psychology, there is nothing in Bern or Basel. (Fribourg need not be mentioned at all.)

[793] In Zurich the following have existed for some years:

1. An association for legal psychiatry, whose chairman I have been since early 1907.[3]

2. There also has existed for many years a psychological-neurological society where an occasional psychological lecture may be heard. The chairman is Professor von Monakow.[4]

3. In addition, in the autumn of 1907 a Society for Freudian Researches was founded (with ca. 20 members). The chairman is Professor Bleuler.[5]

C. G. JUNG (Burghölzli-Zurich)

ON DEMENTIA PRAECOX[1]

[794] The depotentiation of the association process or *abaissement du niveau mental*, which consequently has a downright dreamlike quality, seems to indicate that a pathogenic agent [*Noxe*] contributes to dementia praecox which is absent in, say, hysteria. The characteristics of the *abaissement* were assigned to the pathogenic agent, which was construed as organically conditioned and likened to a symptom of poisoning (e.g., paranoid states in chronic poisoning).

REVIEW OF SADGER: “KONRAD FERDINAND MEYER. EINE PATHOGRAPHISCH-PSYCHOLOGISCHE STUDIE”[1]

[795] The new art of writing biographies from the psychological point of view has already produced a number of moderately successful studies. One has only to think of Möbius[2] on Goethe, Schopenhauer, Schumann, and Nietzsche, and Lange on Hölderlin.[3] Among these “pathographies,” Sadger’s book occupies an exceptional position. It does not stand out because of a meticulous unearthing of the diagnosis, nor does it try to squeeze the poet’s pathology into a particular clinical frame of reference, as Möbius did in an objectionable manner in the case of Goethe. Sadger’s aim is rather to understand the development of the whole personality as a psychological process, and to grasp it from within. It is no matter for regret that the psychiatric pigeon-holing of the “case” receives scant attention. Our understanding is in no way advanced when we know for certain the medical designation of the subject’s state of mind. The recognition that Schumann suffered from dementia praecox and K. F. Meyer from periodic melancholia contributes nothing whatever to an understanding of their psyches. People are only too ready to stop at the diagnosis, thinking that any further understanding can be dispensed with. But this is just where the real task of the pathographer begins, if he wants, as he should, to understand more than the ordinary biographer. The biographer would rather not penetrate too deeply into certain areas, and because he does not understand what is going on there and can discover nothing understandable, he calls those areas mad or “pathological.” Möbius sticks psychiatric labels on them and reports something of their geography. The proper task of the pathographer, however, is to describe in intelligible language what is actually happening in these locked regions of the psyche, and what powerful influences pass to and fro between the world of the understandable and the world of the not-understood. Up to now psychography has failed miserably, believing that its task is complete once insanity has been

established; and there is some justification for this since not a few of the most prominent modern psychiatrists are firmly convinced that insanity is beyond further understanding. The validity of this statement is purely subjective, however: anything we do not understand we are likely to call insane. In view of this limitation, we should not venture so far, let alone assert that what we do not understand is not understandable at all. It *is* understandable, only we are intellectually still so dense and lethargic that our ears cannot hear and our minds cannot grasp the mysteries of which the insane speak. Here and there we do understand something, and occasionally we glimpse inner connections which link up what appears to be wildly fortuitous and utterly incoherent into regular causal chains. We owe this insight to the genius of Sigmund Freud and his psychology, which is now undergoing all the punishments of hell that the scientific Philistines hold in reserve for every new discovery.[4]

[796] Anyone who wishes to read Sadger's book with real understanding should first familiarize himself with Freud's psychology, otherwise he will get a curious impression of the special prominence the author gives to the significance of the mother in the life of the poet. Lacking the requisite knowledge the reader will also find it difficult to understand many of the parenthetical remarks concerning the father-son and mother-son relationship and to appreciate their general validity. It will be evident from these hints that Sadger's book can claim a special place among the pathographies because, unlike the others, it digs down far deeper to the very roots of the pathological and annexes wide areas of that dark world of the non-understood to the world of intelligible things. Anyone who has been able to profit by Freud's writings will read with great interest how the sensitive soul of the poet gradually freed itself from the crushing weight of mother-love and its attendant emotional conflicts, and how as a result the hidden source of poetic creativity began to flow. We owe the author a debt of gratitude for this glimpse into the life of an artist whose development presents so many baffling problems. Readers who bring no preliminary knowledge with them may be prompted by this book to acquire some.

REVIEW OF WALDSTEIN: “DAS UNBEWUSSTE ICH”[1]

[797] For a variety of reasons it is welcome news that Waldstein’s book *The Subconscious Self* has been rescued from oblivion and made accessible to a wider public in an excellent translation. The content of the book is equally good and, in places, very important. In his preface to the German edition, Dr. Veraguth[2] (Zurich) remarks that the book, first published more than a decade ago, is to be valued primarily as an historical document. This, unfortunately, is only too true, for nowhere does the present end sooner and the past begin earlier than in medical literature. The English edition was published at a time when another turn of the ascending spiral of scientific knowledge had just been completed in Germany. The scientists had once again reached the point that had been reached eighty years earlier. Those were the days of that remarkable man Franz Anton Mesmer,[3] perhaps the first in the German-speaking world to observe that, armed with the necessary self-assurance, practically anyone could imitate the miraculous cures wrought at places of pilgrimage, by priests, French kings, and thaumaturges in sheep’s clothing (witness Ast the Shepherd, who relieved his milieu of several million marks). This art was named “Mesmerism.” It was not a swindle, and much good was accomplished by it. Mesmer offered his art to science, and even founded a school, but he took too little account of the fact that ever since science has existed there has also existed an undying élite enthroned at the top, that knows everything far better than anybody else, and from time to time guards mankind against various pernicious aberrations. It protected us from the erroneous belief that Jupiter had moons, that such things as meteors could fall from the air, that puerperal fever was caused by dirty hands, and that the brain possessed a fibrous structure. For eighty years the élite protected psychology from the discovery of hypnotism by pooh-poohing Mesmer’s “animal magnetism.” Nevertheless a few German crackpots and obscurantists of the Romantic Age kept Mesmer’s teachings alive, quietly collecting observations and

experiences that were ridiculed by their contemporaries and successors because they smacked of superstition. Notwithstanding the persistent mocking laughter, the numerous books from the pen of Justinus Kerner, Eschenmayer, Ennemoser, Horst, etc.,[4] to name but a few who reported "curious tales of somnambulists," contain, along with obvious nonsense, glaring truths which were put to sleep for the next sixty years. The French country doctor Liébeault,[5] who made a timid attempt in the sixties to publish a little book on this subject, was stuck with his whole edition unsold at the publisher's for twenty years. Thirty years later there existed a literature of hundreds of books and a number of technical periodicals. The spiral had once again entered this domain. All of a sudden it was discovered that an enormous amount could be done, both in theory and practice, with the earlier "Mesmerism"; that apparently dangerous symptoms of nervous ailments, such as paresis, contractures, paraesthesias, etc., could be produced at will by suggestion and then blown away again—in short, that the whole army of the neuroses, accounting for at least eighty per cent of the neurologist's clientele, were disturbances of a psychic nature. (A realization that is so modern today that its rediscoverers are hailed as incalculably great benefactors of mankind.)

[798] In its unfathomable wisdom the élite instantly recognized that mankind was in dire peril, and declared (1) that suggestion therapy was fraudulent and ineffective; (2) that it was exceedingly dangerous; (3) that the insights gained by hypnotic methods were sheer fabrication, imagination, and suggestion; and (4) that the neuroses were organic diseases of the brain. It had, however, also been rediscovered that our consciousness obviously does not cover the full range of the psyche, that the psychic factor exists and is effective in regions beyond the reach of consciousness. This psychic factor beyond consciousness was named the subconscious or the second ego or the unconscious personality, etc. In Germany the heretics were Dessoir, Forel, Moll, Vogt, and Schrenck-Notzing,[6] among others, and in France, Binet, Janet, and their schools. Waldstein's book on the "subconscious" ego came out just when the movement in Germany had reached its climax. All honest researchers greeted this resurgence with enthusiasm, but the élite rightly regarded it

as deleterious to the development of logical thought. The leading authorities therefore asserted that the subconscious was (1) nonexistent; (2) not psychic but physiological, and hence impenetrable; (3) only feebly conscious, so feeble, in fact, that one is no longer conscious of being conscious of it. Since then the investigators of the “unconscious” have been branded as unscientific; the “unconscious” has no existence at all and is merely a feeble flicker of consciousness. Or else it is physiological, which is the opposite of psychological, and therefore not the concern of the psychologist or of anybody else. In this way it is barricaded against investigation.

[799] But this time, in spite of everything, the seed did not die. Work went ahead steadily, and today we are much further advanced than we were a decade ago. Even so, this advance holds only for the few who have not allowed themselves to become embittered, and who are working indefatigably to open up the abysses of the human psyche to consciousness. For these few, Waldstein’s book is, to be sure, no novelty and will add little to their knowledge, but for all others it contains much that is new and much that is good. It has shrewd things to say about aesthetics and the origin of works of art. Still better is its psychological conception of the neuroses, a conception which one hopes will be widely disseminated, seeing that the élite still clings firmly to the notion that hysteria and nervous disorders originate in alterations within the brain. Unfortunately many run-of-the-mill doctors still swear by this gospel to the detriment of their neurotic patients, whom our age produces in swarms. Nearly all these patients have been convinced by the medical dogma that their sickness is of a physical nature. Again and again the doctors back up this nonsense, and the treatment goes muddling on with its medicaments and magic nostrums. It is hardly surprising that nowadays Christian Science has better results to show than many neurologists. This little book performs a valuable service by at least throwing a ray of light on those dark regions of the psyche from which all human achievements ultimately spring, whether they be artistic creations or nervous disorders. It is to be hoped that books of this kind will find favour with the educated public, so as gradually to prepare the ground for a deeper understanding of the human psyche, and to free the

minds of the sound and sick alike from the crass materialism of the cerebro-organic dogma. The sensitive psychological note which Waldstein strikes gives his book a particularly attractive character, even though his analysis does not probe nearly as deeply as Freud's researches.

CRIME AND THE SOUL[1]

[800] The dual personality of the criminal is frequently apparent at first glance. One need not follow the tortuous path of his psychological experiences, disguises, and eventual unmasking as the story of his dual existence is dramatically told in the film. Generally speaking, every criminal, in his outward show of acting honourably, wears a quite simple disguise which is easily recognizable. Of course, this does not apply to the lowest dregs of the criminal fraternity—to the men and women who have become outcasts from all ordinary human society. Generally, however, criminals, men and women alike, betray a certain ambition to be respectable, and repeatedly emphasize their respectability. The "romance" of a criminal existence is only rarely romantic. A very large number of criminals lead a thoroughly middle-class existence and commit their crimes, as it were, through their second selves. Few criminals succeed in attaining a complete severance between their liking for middle-class respectability, on the one hand, and their instinct for crime on the other.

[801] It is a terrible fact that crime seems to creep up on the criminal as something foreign that gradually gains a hold on him so that eventually he has no knowledge from one moment to another of what he is about to do. Let me illustrate this with a striking example from my own experience.

[802] A nine-year-old boy stabbed his little sister above the eye with a pair of scissors, which penetrated as far as the cerebral membrane. Had it gone half a millimetre deeper the child would have died instantly. Two years earlier, when the boy was seven, his mother told me that there was something wrong with him. The boy was doing some peculiar things. At school, during lessons, he would suddenly rise from his seat and cling to his teacher with every sign of extreme terror. At home he would often run away from play and hide in the loft. When asked to explain the reason he

made no reply. When I spoke to the boy he told me that he had frequent attacks of cramp. Then the following conversation took place:

[803] “Why are you always afraid?”

[804] The child did not reply. I realized that he was reluctant to speak, so I tried persuasion. Finally he said:

[805] “I must not tell you.”

[806] “Why not?”

[807] “I pressed him further, but all I was able to get out of him was that he must not say why he was afraid. At last he blurted it out.

[808] “I am afraid of the man,” he said.

[809] “What man?”

[810] No reply. Then, after much wheedling, I succeeded in winning his confidence. He told me that at the age of seven a little man appeared to him. The little man had a beard. The boy also gave other details of the little man’s appearance. This little man had winked at him, and that had frightened him. That was why he clung to his teacher at school and ran away from play at home to hide in the loft.

[811] “What did this little man want of you?” I asked.

[812] “He wanted to put the blame on me.”

[813] “What do you mean by ‘blame’?”

[814] The boy could not answer. He merely repeated the word “blame.” He said that each time the little man came nearer and nearer to him, and last time he had come quite close, and that was why he, the boy, stabbed his sister. The appearance of the little man was none other than the personification of the criminal instinct, and what the boy described as “blame” was a symbol of the second self that was driving him to destruction.

[815] After the crime the boy had epileptic fits. Since then he has committed no further crimes. In this case as in many others, epilepsy represented an evasion of the crime, a repression of the criminal instinct. Unconsciously people try to escape the inner urge to crime by taking refuge in illness.

[816] In other cases it happens that people who are apparently normal transmit the evil instincts concealed under this appearance of normality to other people, and frequently lead them, quite unconsciously, to carry out the deeds which they themselves would never commit although they would like to.

[817] Here is an example: Some time ago there was a murder in the Rhineland which created a great sensation. A man of up-to-then blameless character killed his entire family, and even his dog. No one knew the reason; no one had ever noticed anything abnormal about the man. This man told me that he had bought a knife without having any particular object in mind. One night he fell asleep in the living-room, where there was a clock with a pendulum. He heard the ticking of the clock, and this tick-tock was like the sound of a battalion of marching soldiers. The sound of marching gradually died away, as though the battalion had passed. When it ceased completely he suddenly felt, “Now I must do it.” Then he committed the murders. He stabbed his wife eleven times.

[818] According to my subsequent investigations it was the woman who was chiefly to blame for what happened. She belonged to a religious sect, whose members regarded all who do not pray with them as outsiders, children of the devil, and themselves as saints. This woman transmitted the evil that was in her, unconsciously perhaps, but quite certainly, to her husband. She persuaded him that he was evil, whereas she herself was good, and instilled the criminal instinct into his subconscious mind. It was characteristic that the husband recited a saying from the Bible at each stab, which best indicates the origin of his hostility.

[819] Far more crime, cruelty, and horror occur in the human soul than in the external world. The soul of the criminal, as manifested in his deeds, often affords an insight into the deepest psychological processes of humanity in general. Sometimes it is quite remarkable what a background such murders have, and how people are driven to perpetrate acts which at any other time and of their own accord they would never commit.

[820] Once a baker went for his Sunday walk. The next thing he knew was that on waking up he found himself in a police cell, with his hands and feet manacled. He was amazed. He thought he was dreaming. He had no

idea why he was locked up. But in the meantime the man had murdered three people and seriously injured two. Undoubtedly he committed these crimes in a cataleptic state. The baker's Sunday walk turned out quite differently from what he had intended on leaving home. The wife of this baker was a member of the same sect as the other woman, and therefore a "saint," so that the motive of this crime is analogous to that described above.

[821] The more evil a person is, the more he tries to force upon others the wickedness he does not want to show to the outside world. The baker and the Rhinelander were respectable men. Before they committed their crimes they would have been amazed had anyone thought them capable of such things. They certainly never intended to commit murder. This idea was unconsciously instilled into them as a means of abreacting the evil instincts of their wives. Man is a very complicated being, and though he knows a great deal about all sorts of things, he knows very little about himself.

THE QUESTION OF MEDICAL INTERVENTION[1]

The medical journal *Psyche* published answers[2] to a questionnaire sent to twenty-eight doctors concerning a report by Dr. Medard Boss, delivered at the 66th Congress of South-west German Psychiatrists and Neurologists in Badenweiler, in which he presented the case of a transvestite "under its existential-analytical aspect." The treatment ended with the total castration of the patient by Dr. Boss, including amputation of the penis with implantation of artificial labiae. The report provoked critical comments from some of his colleagues[3] followed by a rejoinder from Dr. Boss.[4] In view of the significance of the case for the doctor-patient relationship, the editors of *Psyche* circulated the following questionnaire to the colleagues whom Dr. Boss had named:

1. Do you consider an intervention like that performed by Dr. Boss permissible from the general medical standpoint or not?

2. Do you consider such an intervention permissible from the standpoint of the psychotherapist?

[822] I had first of all to plough my way through the report of this case. The totally superfluous existentialist jargon complicates the situation unnecessarily and does not make for enjoyable reading. The patient was obviously bent upon getting himself transformed into a woman as far as possible and equally set against any other kind of influence. It is quite clear that nothing could be done about it psychotherapeutically. That settles Question 2. An operation like this has nothing to do with psychotherapy, because anyone, the patient included, could have advised himself to ask a surgeon to castrate him. If Dr. Boss gave him this advice, that is his own private affair, and something that one does not make a song and dance about in public.

[823] Question 1 is not so easy to answer. On the principle *nulla poena sine lege* an intervention of this kind is "justified" if the law either permits it or does not forbid it. There is no law against cosmetic operations, and if I succeed in persuading a surgeon to amputate a finger for me that is his

and my private affair, a problem of individual ethics. If anyone who is *compos mentis* wishes to be castrated and feels happier for it afterwards than he did before, there is not much in his action that one can fairly object to. If the doctor is convinced that such an operation really does help his patient, and nobody is injured by it, his ethical disposition to help and ameliorate might very well prompt him to perform the operation without anyone being in a position to object to it on principle. Only, he should realize that he is offending the collective professional ethics of doctors in a hazardous way by his somewhat unusual and unconventional procedure. Moreover, the operation affects an organ that is the object of a collective taboo; that is to say, castration is a *numinous mutilation* which makes a powerful impression on everyone and is consequently hedged about with all sorts of emotional considerations. A doctor who risks this intervention should not be surprised if there is a collective reaction against it. He may be justified before his own conscience, but he risks his reputation by violating collective feeling. (The hangman is in much the same situation.) Insults of this nature are not in the interests of the medical profession and are therefore, quite rightly, abhorred.

[824] Dr. Boss would have done better to preserve a decent silence about this painful affair instead of proclaiming it *urbi et orbi* with “existential-analytical” *éclat*, however concerned he was to justify himself in the eyes of his profession. Evidently he has only the dimmest notion of how much his action offends professional medical feeling.

[825] So I can answer Question I by saying that, for the above reasons, I consider the intervention, from the medical standpoint, hazardous if not impermissible. From the individual standpoint I would prefer to give Dr. Boss the benefit of the doubt.

FOREWORD TO CUSTANCE: “WISDOM, MADNESS AND FOLLY”[1]

[826] When I was working in 1906 on my book *The Psychology of Dementia Praecox*[2] (as schizophrenia was then called), I never dreamt that in the succeeding half-century psychological investigation of the psychoses and their contents would make virtually no progress whatever. The dogma, or intellectual superstition, that only physical causes are valid still bars the psychiatrist’s way to the psyche of his patient and impels him to take the most reckless and incalculable liberties with this most delicate of all organs rather than allow himself even to think about the possibility of genuinely psychic causes and effects, although these are perfectly obvious to an unprejudiced mind. All that is necessary is to pay attention to them, but this is just what the materialistic prejudice prevents people from doing, even when they have seen through the futility of metaphysical assumptions. The organic, despite the fact that its nature is largely unknown and purely hypothetical, seems much more convincing than psychic reality, since this still does not exist in its own right and is regarded as a miserable vapour exhaled, as it were, from the albuminous scheme of things. How in the world do people know that the only reality is the physical atom, when this cannot even be proved to exist at all except by means of the psyche? If there is anything that can be described as primary, it must surely be the psyche and not the atom, which, like everything else in our experience, is presented to us directly only as a psychic model or image.

[827] I still remember vividly the great impression it made upon me when I succeeded for the first time in deciphering the apparently complete nonsense of schizophrenic neologisms, which must have been infinitely easier than deciphering hieroglyphs or cuneiform inscriptions. While these give us authentic insight into the intellectual culture of ancient man—an achievement certainly not to be underestimated—deciphering of the products of insanity and of other manifestations of the unconscious unlocks the meaning of far older and more fundamental psychic

processes, and opens the way to a psychic underworld or hinterland which is the matrix not only of the mental products of the past but of consciousness itself. This, however, seems quite uninteresting to the psychiatrist and to concern him least of all—just as if it were tremendously important to know exactly where the stones were quarried to build our medieval cathedrals, but of no importance whatever to know what the meaning and purpose of these edifices might be.

[828] Half a century has not sufficed to give the psychiatrist, the "doctor of the soul," the smallest acquaintance with the structure and contents of the psyche. Nobody need write an apology for the meaning of the brain since it can actually be put under the microscope. The psyche, however, is nothing, because it is not sufficiently physical to be stained and mounted on a slide. People still go on despising what they don't know, and what they know least of all they claim to know best. The very attempt to bring some kind of order into the chaos of psychological experience is considered "unscientific," because the criteria of physical reality cannot be applied directly to psychic reality. Documentary evidence, though fully recognized in the study of history and in jurisprudence, still seems to be unknown in the realm of psychiatry.

[829] For this reason a book like the present one should be particularly welcome to psychologists. It is a *document humain*, unfortunately one of few. I know no more than half a dozen such autochthonous descriptions of psychosis, and of these this is the only one derived from the domain of manic-depressive insanity, all the others being derived from that of schizophrenia. In my experience at any rate it is quite unique. Certainly there are, in numerous clinical histories, comparable descriptions given by the patients themselves, but they never reach the light of day in the form of a printed publication; and besides, few of them could equal the autobiography of our author in point of articulateness, general education, wide reading, deep thought, and self-criticism. The value of this book is all the greater because, uninfluenced by any outside literature, it describes the discovery, or rather the rediscovery, of certain fundamental and typical psychic structures. Although I myself have been studying the very same phenomena for years, and have repeatedly described them, it still came to me as a surprise and a novelty to see how the delirious flight

of ideas and uninhibitedness of the manic state lower the threshold of consciousness to such an extent that, as with the *abaissement du niveau mental* in schizophrenia, the unconscious is laid bare and rendered intelligible. What the author has discovered in the manic state is in exact agreement with my own discoveries. By this I mean more particularly the structure of opposites and their symbolism, the anima archetype, and lastly the unavoidable encounter with the reality of the psyche. As is generally known, these three main points play an essential role in my psychology, with which, however, the author did not become acquainted until afterwards.

[830] It is of particular interest, more especially for the expert in this field, to see what kind of total picture emerges when the inhibitions exerted by the conscious mind on the unconscious are removed in mania. The result is a crude and unmitigated system of opposites, of every conceivable colour and form, extending from the heights to the depths. The symbolism is predominantly collective and archetypal in character, and thus decidedly mythological or religious. Clear indications of an individuation process are absent, since the dialectical drama unfolds in the spontaneous, inner confrontation of opposites before the eyes of a perceiving and reflecting subject. He does not stand in any dialectical relationship to a human partner; in other words, there is no dialogue. The values delineate themselves in an undifferentiated system of black and white, and the problem of the differentiated functions is not posed. Hence the absence of any clear signs of individuation; as is well known, the prerequisite for this is an intense relationship with another individual and a coming to terms with him. The question of relationship, or Eros, nowhere appears as a problem in this book. Instead, psychic reality, which the author very rightly calls "actuality," receives all the more attention, and the value of this cannot be denied.

[831] As might be expected from the impressive contents of his psychosis, the author was profoundly affected by them. This runs like a leit-motiv through his book from the beginning to the end, making it a confessional monologue addressed to an anonymous circle of listeners, as well as an encounter with the equally anonymous spirit of the age. Its intellectual horizon is wide and does honour to the "logos" of its author. I do not

know what sort of impression it will make on the “normal” layman, who has never had anything thrust upon him from the other side of the barrier. I can only say that psychiatrists and practising psychologists owe the author the greatest possible thanks for the illumination his unaided efforts have given them. As a contribution to our knowledge of those highly significant psychic contents that manifest themselves in pathological conditions or underlie them, his book is as valuable as it is unique.

FOREWORD TO PERRY: "THE SELF IN PSYCHOTIC PROCESS"[1]

[832] As I studied Dr. Perry's manuscript, I could not help recalling the time when I was a young alienist searching vainly for a point of view which would enable me to understand the workings of the diseased mind. Merely clinical observations—and the subsequent post mortem when one used to stare at a brain which ought to have been out of order yet showed no sign of abnormality—were not particularly enlightening. "Mental diseases are diseases of the brain" was the *axiom*, and told one just nothing at all. Within my first months at the Clinic,[2] I realized that the thing I lacked was a *real psychopathology*, a science which showed what was happening in the mind during a psychosis. I could never be satisfied with the idea that all that the patients produced, especially the schizophrenics, was nonsense and chaotic gibberish. On the contrary, I soon convinced myself that their productions meant something which could be understood, if only one were able to find out what it was. In 1901, I started my association experiments with normal test persons in order to create a normal basis for comparison. I found then that the experiments were almost regularly disturbed by psychic factors beyond the control of consciousness. I called them *complexes*. No sooner had I established this fact than I applied my discovery to cases of hysteria and schizophrenia. In both I found an inordinate amount of disturbance, which meant that the unconscious in these conditions is not only opposed to consciousness but also has an extraordinary energic charge. While with neurotics the complexes consist of split-off contents, which are systematically arranged, and for this reason are easily understandable, with schizophrenics the unconscious proves to be not only unmanageable and autonomous, but highly unsystematic, disordered, and even chaotic. Moreover, it has a peculiar dreamlike quality, with associations and bizarre ideas such as are found in dreams. In my attempts to understand the contents of schizophrenic psychoses, I was considerably helped by Freud's book on dream interpretation, which had just appeared (1900). By 1905, I had acquired so much reliable knowledge about the

psychology of schizophrenia (then called “dementia praecox”) that I was able to write two papers[3] about it. *The Psychology of Dementia Praecox* (1906) had practically no influence at all, since nobody was interested in pathological psychology except Freud, with whom I had the honour of collaborating for the next seven years.

[833] Dr. Perry, in this book, gives an excellent picture of the psychic contents with which I found myself confronted. At the beginning, I felt completely at a loss in understanding the association of ideas which I could observe daily with my patients. I did not know then that all the time I had the key to the mystery in my pocket, inasmuch as I could not help seeing the often striking parallelism between the patients’ delusions and mythological motifs. But for a long time I did not dare to assume any relationship between mythological formations and individual morbid delusions. Moreover, my knowledge of folklore, mythology, and primitive psychology was regrettably deficient, so that I was slow in discovering how common these parallels were. Our clinical approach to the human mind was only medical, which was about as helpful as the approach of the mineralogist to Chartres Cathedral. Our training as alienists was much concerned with the anatomy of the brain but not at all with the human psyche. One could not expect very much more in those days, when even neuroses, with their overflow of psychological material, were a psychological *terra incognita*. The main art the students of psychiatry had to learn in those days was how not to listen to their patients.

[834] Well, I had begun to listen, and so had Freud. He was impressed with certain facts of neurotic psychology, which he even named after a famous mythological model, but I was overwhelmed with “historical” material while studying the psychotic mind. From 1906 until 1912 I acquired as much knowledge of mythology, primitive psychology, and comparative religion as possible. This study gave me the key to an understanding of the deeper layers of the psyche and I was thus enabled to write my book[4] with the English title *Psychology of the Unconscious*. This title is slightly misleading, for the book represents the analysis of a prodromal schizophrenic condition. It appeared forty years ago, and last year I published a fourth, revised edition under the title *Symbols of*

Transformation. One could not say that it had any noticeable influence on psychiatry. The alienist's lack of psychological interest is by no means peculiar to him. He shares it with a number of other schools of thought, such as theology, philosophy, political economy, history, and medicine, which all stand in need of psychological understanding and yet allow themselves to be prejudiced against it and remain ignorant of it. It is only within the last years, for instance, that medicine has recognized "psychosomatics."

[835] Psychiatry has entirely neglected the study of the psychotic mind, in spite of the fact that an investigation of this kind is important not only from a scientific and theoretical standpoint but also from that of practical therapy.

[836] Therefore I welcome Dr. Perry's book as a messenger of a time when the psyche of the mental patient will receive the interest it deserves. The author gives a fair representation of an average case of schizophrenia, with its peculiar mental structure, and, at the same time, he shows the reader what he should know about general human psychology if he wishes to understand the apparently chaotic distortions and the grotesque "bizarrerie" of the diseased mind. An adequate understanding often has a remarkable therapeutic effect in milder cases which, of course, do not appear in mental hospitals, but all the more in the consultation hours of the private specialist. One should not underrate the disastrous shock which patients undergo when they find themselves assailed by the intrusion of strange contents which they are unable to integrate. The mere fact that they have such ideas isolates them from their fellow men and exposes them to an irresistible panic, which often marks the outbreak of the manifest psychosis. If, on the other hand, they meet with adequate understanding from their physician, they do not fall into a panic, because they are still understood by a human being and thus preserved from the disastrous shock of complete isolation.

[837] The strange contents which invade consciousness are rarely met with in neurotic cases, least not directly, which is the reason why so many psychotherapists are unfamiliar with the deeper strata of the human psyche. The alienist, on the other hand, rarely has the time or the necessary scientific equipment to deal with, or even to bother with, his

patients' psychology. In this respect, the author's book fills a yawning gap. The reader should not be misled by the current prejudice that I produce nothing but theories. My so-called theories are not figments but facts that can be verified, if one only takes the trouble, as the author has done with so much success, to listen to the patient, to give him the credit—that is humanly so important—of meaning something by what he says, and to encourage him to express himself as much as he possibly can. As the author has shown, drawing, painting and other methods are sometimes of inestimable value, inasmuch as they complement and amplify verbal expression. It is of paramount importance that the investigator should be sufficiently acquainted with the history and phenomenology of the mind. Without such knowledge, he could not understand the symbolic language of the unconscious and so would be unable to help his patient assimilate the irrational ideas that bewilder and confuse his consciousness. It is not a "peculiar historical interest," a sort of hobby of mine to collect historical curiosities, as has been suggested, but an earnest endeavour to help the understanding of the diseased mind. *The psyche, like the body, is an extremely historical structure.*

[838] I hope that Dr. Perry's book will arouse the psychiatrist's interest in the psychological aspect of his cases. Psychology belongs as much to his training as anatomy and physiology to that of the surgeon.

FOREWORD TO SCHMALTZ: “KOMPLEXE PSYCHOLOGIE UND KÖRPERLICHES SYMPTOM”[1]

[839] Having read his book with lively interest and undivided agreement, I am all the more ready to comply with the author’s request that I say a few words by way of introduction. He has successfully undertaken to treat a case from the field of psychosomatic medicine psychologically, in collaboration with an internal specialist, and to describe the whole course of the treatment up to the cure in all its details. The clinical description of the case is impeccable and thorough, and it seems to me that its psychological elucidation and interpretation is equally satisfactory. Nowhere does the author betray any theoretical bias; all his conclusions are amply documented with noteworthy care and circumspection. The clinical history concerns one of those frequent cases of cardiac disorder, a disease that is associated with the lesion of feeling so characteristic of our tme. The author deserves particular credit for fearlessly pointing out the deeper reasons for a neurosis and for setting it in a broader context. A neurosis is an expression of the “affections” of the whole man, and it is impossible to treat the whole man solely within the framework of a medical specialism. Psychogenic causes have to do with the psyche, and this, by its very nature, not only extends beyond the medical horizon but also, as the matrix of all psychic events, transcends the bounds of scientific understanding. Certainly the aetiological details have to be worked out within the limits of a specialist method, but the psychology and therapy of the neurosis demand an Archimedean point outside, without which they merely turn in a circle. Indeed, medicine itself is a science that has been able to make such great progress only because it borrowed lavishly from the other sciences. It necessarily had to draw physics, chemistry, and biology into its orbit, and if this was true of somatic medicine, then the psychology of the neuroses will not be able to get along without borrowing from the humanities.

[840] Of decisive importance for the aetiology and therapy of the neuroses is the individual's own attitude. If this is subjected to careful analysis, one finds that it rests on personal and collective premises which can be pathogenic as well as curative in their effects. Just as modern medicine is no longer content to establish that a patient has infected himself with typhoid fever, but must also worry about the water supply responsible for the infection, so the psychology of the neuroses cannot possibly be content with an aetiology that makes do with traumata and infantile fantasies. We have known for a long time that children's neuroses depend on the psychic situation of the parents. We also know to our cost how much these "psychic situations" are due not merely to personal defects but to collective psychic conditions. That would be reason enough for the specialist to take heed of these general conditions—one cannot combat an epidemic of typhoid even with the most careful diagnosis and treatment of individual cases. The older medicine had to be satisfied with handing out any philtre provided only that it helped. Thanks to the auxiliary sciences, modern medicine is in a position to find out the true nature of its nostrums. But what cures a neurosis? In order to find the real answer to this question, the psychology of the neuroses must go far beyond its purely medical confines. There are a few doctors who already have inklings of this. In this respect, too, the author has dared to fling open one or two windows.

VI

FREUD AND PSYCHOANALYSIS

(related to Volume 4 of the Collected Works)

SIGMUND FREUD: “ON DREAMS”[1]

25 *January 1901*

[841] Freud begins by giving a short exposition of his work. He first distinguishes the various interpretations which the problem of dreams has undergone in the course of history:

1. The old “mythological” or, rather, mystical hypothesis that dreams are meaningful utterances of a soul freed from the fetters of sense. The soul is conceived as a transcendent entity which either produces dreams independently, as [Gotthilf Heinrich von] Schubert still supposed, or else represents the medium of communication between the conscious mind and divine revelation.

2. The more recent hypothesis of [K. A.] Schemer and [J.] Volkelt, according to which dreams owe their existence to the operation of psychic forces that are held in check during the day.

3. The critical modern view that dreams can be traced back to peripheral stimuli which partially affect the cerebral cortex and thereby induce dream-activity.

4. The common opinion that dreams have a deeper meaning, and may even foretell the future. Freud, with reservations, inclines to this view. He does not deny the dream a deeper meaning and admits the rightness of the common method of dream interpretation, in so far as it takes the dream-image as a symbol for a hidden content that has a meaning.

[842] In his opening observations Freud compares dreams with obsessional ideas, which, like them, are strange and inexplicable to the conscious mind.

[843] The psychotherapy of obsessional ideas offers the key to unravelling the ideas in dreams. Just as we get a patient who suffers from an obsession to take note of all the ideas that associate themselves with the dominating idea, we can make upon ourselves the experiment of observing everything that becomes associated with the ideas in the dream

if, without criticism, we allow all those things to appear which we are in the habit of suppressing as worthless and disturbing. We take note, therefore, of all psychically valueless ideas, the momentary perceptions and thoughts which are not accompanied by any deeper feeling of value, and which are produced every day in unending quantities.

[844] Example, p. 310:[2] On the basis of the results of this method, Freud conjectures that the dream is a kind of substitute, that is, a symbolic representation of trains of thought that have a meaning, and are often bound up with lively affects. The mechanism of this substitution is still not very clear at present, but at any rate we may accord it the status of an extremely important psychological process once we have established its beginning and end by the method just described. Freud calls the content of the dream as it appears in consciousness the *manifest content of the dream*. The material of the dream, the psychological premises, that is to say all the trains of thought that are hidden from the dreaming consciousness and can be discovered only by analysis, he calls the *latent content of the dream*. The synthetic process, which elaborates the disconnected or only superficially connected ideas into a relatively unified dream-image, is called the *dream-work.*

[845] We are now faced with two cardinal questions:

1. What is the psychic process that changes the latent dream-content into the manifest dream-content?

2. What is the motive for this change?

[846] There are dreams whose latent content is not hidden at all, or barely so, and which in themselves are logical and understandable because the latent content is practically identical with the manifest content. Children’s dreams are frequently of this kind, because the thought-world of children is chiefly filled with sensuous, concrete imagery. The more complicated and abstract the thoughts of an adult become, the more confused are most of his dreams. We seldom meet with a completely transparent and coherent dream in an adult. Frequently the dreams of adults belong to the class of dreams which, though meaningful and logical in themselves, are unintelligible because their meaning does not in any way fit the thought-processes of the waking consciousness. The great majority of dreams, however, are confused, incoherent dreams that

surprise us by their absurd or impossible features. These are the dreams, also, that are furthest removed from their premise, the latent dream-material, that bear the least resemblance to it and are therefore difficult to analyse, and have required for their synthesis the greatest expenditure of transformative psychic energy.

[847] Children’s dreams, with their clarity and transparent meaning, are the least subject to the transformative activity of the dream-work. Their nature is therefore fairly clear; most of them are wish-dreams.

[848] A child that is hungry dreams of food, a pleasure forbidden the day before is enacted in the dream, etc. Children are concerned with simple sensuous objects and simple wishes, and for this reason their dreams are very simple too. When adults are concerned with similar objects, their dreams as well are very simple. To this class belong the so-called dreams of convenience, most of which take place shortly before waking. For example, it is time to get up, and one dreams that one is up already, washing, dressing, and already at work. Or if any kind of examination is impending, one finds oneself in the middle of it, etc. With adults, however, very simple-looking dreams are often fairly complicated because several wishes come into conflict and influence the formation of the dream-image.

[849] For children’s dreams and dreams of convenience in adults the author lays down the following formula: A thought expressed in the optative has been replaced by a representation in the present tense.[3]

[850] The second of the questions we asked, concerning the motive for the conversion of the latent content into the concrete dream-image, can be answered most easily in these simple cases. Evidently the enacted fulfilment of the wish mitigates its affectivity; in consequence, the wish does not succeed in breaking through the inhibition and waking the sleeping organism. In this case, therefore, the dream performs the function of a guardian of sleep.

[851] Our first question, concerning the process of the dream-work, can best be answered by examining the confused dreams.

[852] In examining a confused dream, the first thing that strikes us is how very much richer the latent dream-material is than the dream-image

constructed from it. Every idea in the manifest dream proves, on analysis, to be associated with at least three or four other ideas which all have something in common. The corresponding dream-image frequently combines all the different characteristics of the individual underlying ideas. Freud compares such an image with Galton's family photographs, in which several exposures are superimposed. This combination of different ideas Freud calls *condensation*. To this process is due the indefinite, blurred quality of many dream-images. The dream knows no "either-or" but only the copulative "and."

[853] Often, on a superficial examination of two ideas united in a single image, no common factor can be found. But, on penetrating more deeply, we discover that whenever no *tertium comparationis* is present, the dream creates one, and generally does so by manipulating the linguistic expression of the ideas in question. Sometimes dissimilar ideas are homophonous; sometimes they rhyme, or could be confused with one another if attention is poor. The dream uses these possibilities as a *quid pro quo* and thus combines the dissimilar elements. In other cases it works not only wittily but positively poetically, speaking in tropes and metaphors, creating symbols and allegories, all for the purpose of concealment under deceptive veils. The process of condensation begets monstrous figures that far surpass the fabulous beings in Oriental fairytales. A modern philosopher holds that the reason why we are so prosaic in our daily lives is that we squander too much poetic fantasy in our dreams. The figures in a confused dream are thus, in the main, composite structures. (Example on p. 321.)[4]

[854] In the manifest dream, the latent dream-material is represented by these composite structures, which Freud calls the dream-elements. These elements are not incoherent, but are connected together by a common dream-thought, i.e., they often represent different ways of expressing the same dominating idea.

[855] This rather complicated situation explains a good deal of the confusion and unintelligibility of the dream, but not all of it. So far we have considered only the ideational side of the dream. The feelings and affects, which play a very large part, have still to be discussed.

[856] If we analyse one of our own dreams, we finally arrive by free association at trains of thought which at one time or another were of importance to us, and which are charged with a feeling of value. During the process of condensation and reinterpretation, certain thoughts are pushed onto the stage of the dream, and their peculiar character might easily invite the dreamer to criticize and suppress them, as actually happens in the waking state. The affective side of the dream, however, prevents this, since it imbues the dream elements with feelings that act as a powerful counterweight to all criticism. Obsessional ideas function in the same way. For example, agoraphobia manifests itself with an overwhelming feeling of fear, and so maintains the position it has usurped in consciousness.

[857] Freud supposes that the affects attached to the components of the latent dream-material are transferred to the elements of the manifest dream, thus helping to complete the dissimilarity between the latent and the manifest content. He calls this process *displacement*, or, in modern terms, a transvaluation of psychic values.

[858] By means of these two principles, the author believes he can offer an adequate explanation of the obscurity and confusion of a dream constructed out of simple, concrete thought-material. These two hypotheses shed a new light on the question of the instigator of a dream, and the connection between the dream and waking life. There are dreams whose connection with waking life is quite evident, and whose instigator is a significant impression received during the day. But far more frequently the dream-instigator is an incident which, although trivial enough in itself, and often positively silly, in spite of its complete valuelessness, introduces a long and intensely affective dream. In these cases, analysis leads us back to complexes of ideas which, though unimportant in themselves, are associated with highly significant impressions of the day by incidental relationships of one kind or another. In the dream the incidental elements occupy a large and imposing place, while the significant ones are completely occluded from the dreaming consciousness. The real instigator of the dream, therefore, is not the trivial, incidental element, but the powerful affect in the background. Why, then, does the affect detach itself from the ideas that are associated

with it, and in their place push the nugatory and valueless elements into consciousness? Why does the dreaming intellect trouble to rout out the forgotten, incidental, and unimportant things from every corner of our memory, and to build them up into elaborate and ingenious images?

[859] Before turning to the solution of this question, Freud tries to point out further effects of the dream-work in order to shed a clear light on the purposiveness of the dream-functions.

[860] In adults, besides visual and auditory memory-images, the material underlying the dream includes numerous abstract elements which it is not so easy to represent in concrete form. In considering the *representability of the dream-content*, a new difficulty arises which influences the dream's performance. At this point the author digresses a bit and describes how the dream represents logical relations in sensuous imagery. His observations in this respect are of no further importance for his theory; they merely serve to increase the stock of the discredited dream in the estimation of the public.

[861] One extremely remarkable effect of the dream-work is what Freud calls the *dream-composition*. This, according to his definition, is a kind of revision which the disordered mass of dream-elements undergo at the moment of their inception—a regular dramatization frequently conforming to all the rules of art exposition, development, and solution. In this way the dream acquires, as the author says, a façade, which does not of course cover it up at all points. This façade is in Freud's view the crux of the misunderstanding about dreams, since it systematizes the deceptive play of the dream-elements and brings them into a plausible relationship. Freud thinks that the reason for this final shaping of the dream-content is the regard for intelligibility. He imagines the dream producer as a kind of jocular daimon who wants to make his plans plausible to the sleeper.

[862] Apart from this last effect of the dream-work, what is created by the dream is nothing in any way new or intellectually superior. Anything of value in the dream-image can be shown by analysis to be already present in the latent material. And it may very well be doubted whether the dream-composition is anything but a direct effect of reduced

consciousness, a fleeting attempt to explain the hallucinations of the dream.

[863] We now come to the final question: Why does the dream do this work? In analysing his own dreams, the author usually came upon quickly forgotten and unexpected thoughts of a distinctly unpleasant nature, which had entered his waking consciousness only to be suppressed again immediately. He designates the state of these thoughts by the name *repression.*

[864] In order to elucidate the concept of repression, the author postulates two thought-producing systems, one of which has free access to consciousness, while the other can reach consciousness only through the medium of the first. To put it more clearly, there is on the borderline between conscious and unconscious a *censorship* which is continually active throughout waking life, regulating the flow of thoughts to consciousness in such a way that it keeps back all incidental thoughts which for some reason are prohibited, and admits to consciousness only those of which it approves. During sleep there is a momentary predominance of what was repressed by day; the censorship must relax and produces a compromise—the dream. The author does not conceal the somewhat too schematic and anthropomorphic features of this conception, but solaces himself with the hope that its objective correlate may one day be found in some organic or functional form.

[865] There are thoughts, often of a preeminently egoistic nature, which are able to slip past the censorship imposed by ethical feelings and criticism when this is relaxed in sleep. The censorship, however, is not entirely abrogated, but only reduced in effectiveness, so that it can still exert some influence on the shaping of the dream-thoughts. The dream represents the reaction of the personality to the intrusion of unruly thoughts. Its contents are repressed thoughts portrayed in distorted or disguised form.

[866] From the example of dreams that are comprehensible and have a meaning, it is evident that their content is generally a fulfilled wish. It is the same with confused dreams that are difficult to understand. They, too, contain the fulfilment of repressed wishes.

[867] Dreams, therefore, can be divided into three classes:

1. Those that represent an *unrepressed wish in undisguised form*. Such dreams are of the infantile type.

2. Those that represent the fulfilment of a *repressed wish in disguised form*. According to Freud, most dreams belong to this class.

3. Those that represent a *repressed wish in undisguised form*. Such dreams are said to be accompanied by fear, the fear taking the place of dream-distortion.

[868] Through the conception of the dream as a compromise we arrive at an explanation of dreams in general. When the waking consciousness sinks into sleep, the energy needed to maintain the inhibition against the sphere of repressed material abates. But just as the sleeper still has some attention at his disposal for sensory stimuli coming from outside, and, by means of this attention, can eliminate sleep-disturbing influences by weaving around them a disguising veil of dreams, so stimuli arising from within, from the unconscious psychic sphere, are neutralized by the periphrasis of a dream. The purpose in both cases is the same, namely, the preservation of sleep, and for this reason Freud calls the dream the "guardian of sleep." Excellent examples of this are waking dreams, which abound in periphrastic inventions designed to make the continuation of the reverie plausible.

[869] Confused dreams are not so clear in this respect, but Freud maintains that, with application and goodwill, repressed wishes can be discovered in them too. On this point he adopts a rather one-sided attitude, since, instead of a wish, the cause of a dream may easily prove to be just the opposite, a repressed fear, which, manifesting itself in undisguised and often exaggerated form, makes the teleological explanation of dreams appear doubtful.

Freud: Dreams

CONTENTS

[870] *Arrangement:*

Introduction.

1. Example from analysis. Uncritical tracing back of associations.
    - a) Manifest dream-content.
    - b) Latent dream-content.
2. Classification of dreams.
    - a) Meaningful and intelligible.
    - b) Meaningful and unintelligible.
    - c) Confused.
3. Children’s dreams.
4. Adults. Dreams of convenience and wish-dreams.
5. Causes of the strangeness of dreams.
    - a) Condensation.
        - i. by means of the natural common factor.
        - ii. by means of a common factor created by the dream itself.
    - b) Displacement. Dream-distortion. Distortion of prohibited thoughts.
    - c) Concrete representation of inadequate ideas, hence metaphors.
        - Sensuous metamorphosis of logical relations.
        - Causal: transformation or mere juxtaposition.
        - Alternatives = “and.”
        - Similarity, common factor, congruence.
        - Contradiction, mockery, scorn = absurdity of manifest dream.
    - d) Dream-composition for the purpose of intelligibility.
    - e) Teleological conception: dream as guardian of sleep.

REVIEW OF HELLPACH: “GRUNDLINIEN EINER PSYCHOLOGIE DER HYSTERIE”[1]

[871] All those professional colleagues who are interested in the great problem of hysteria will surely welcome with joy and eager expectation a work that, judging by its bulk, promises a thorough-going treatment of the psychology of hysteria on the broadest possible basis. Anyone acquainted with the present position of the hysteria theory, and especially the psychology of hysteria, is aware that our knowledge of this obscure field is unfortunately a minimal one. Freud’s researches, which have received but scant recognition though they have not yet been superseded, have prepared the ground for thinking that future research into hysteria will be psychological. Hellpach’s book appears to meet this expectation. Casting the most cursory glance at the index of names appended to the end of the book, we find the following cited: Archimedes, Behring, Billroth, Büchner, Buddha, Cuvier, Darwin, Euler, Fichte, Galileo, Gall, Goethe, Herbart, Hume, Kepler, Laplace, de la Mettrie, Newton, Rousseau, Schelling, and many others, all illustrious names among which we now and then light on that of a psychiatrist or neurologist. There can be no doubt at all that a future theory of hysteria will go far beyond the narrow confines of psychiatry and neurology. The deeper we penetrate into the riddle of hysteria, the more its boundaries expand. Hellpach thus starts from a basis of great scope, assuredly not without reason. But when we recall the limitless range of knowledge indicated by the names in the index, Hellpach’s basis for a psychology of hysteria would seem to have undergone a dangerous expansion.

[872] From various hints thrown out by the author we gather that he is inclined to suspect adverse critics of being ill-intentioned. I would therefore like to say at once that I have no prejudices against Hellpach. On the contrary, I have read his book *sine ira* and with attention, in the honest endeavour to understand it and be fair to it. The text up to p. 146 can be considered an introduction. There are disquisitions on the

concepts, theories, and history of science, ranging over every conceivable field of knowledge, which at first blush have nothing to do with hysteria. A mere handful of aphorisms culled from the history of the hysteria theory, chiefly appreciations of the achievements of Charcot and other investigators, have a tenuous connection with the theme. I do not feel competent to criticize the highly generalized discussions on the theories of scientific research. The sidelights from the history of hysteria research are neither exhaustive as a presentation of the subject nor do they offer the researcher anything new. They make practically no contribution to psychology.

[873] The actual treatment of the theme begins on p. 147. First we have a discussion on *suggestibility*. Here Hellpach's thinking and his sure touch must be applauded: he is tackling one of the most difficult points in the hysteria theory. It is immediately obvious that the current concept of suggestibility is rather vague and hence unsatisfactory. Hellpach tries to probe the problem of volition and motivation by analysing "command" and "suggestion." The analysis leads on to a discussion of mechanization and *demotivation:* emancipation of the act of will from the motive. By various convoluted trains of thought we then get to the problem of apperception (as understood by Wundt), which is intimately connected with the problem of volition. Hellpach attaches particular importance to one quality of apperception, and that is the *extinction of sensation*. Stimuli which are only just perceptible on the periphery of the visible field may under certain circumstances be extinguished, but the source of the stimulus (small stars, etc.) disappears as the result of focussing. This observation is extended by analogy to apperception, so-called active apperception taking over the role of focussing. A sensation-extinguishing effect is thus attributed to apperception. Hellpach expatiates at length on this notion, unfortunately in a hardly intelligible manner and without adducing sufficient reasons in support. Extinction of sensation seems to him to be something common and regular. But actually it is an exception, for apperception does not extinguish sensation—on the contrary. The discussion on apperception culminates in the passage: "The control that in the more passive state of apperception extends over the whole field of

consciousness disappears with the increasing tension of active apperception. This gives rise to distracted actions."

[874] A further "state of apperception" Hellpach finds in "emptiness of consciousness." Here he undertakes, among other things, a little excursion into the uncultivated deserts of dementia praecox and carries off, as a trophy, negativism as a manifestation of suggestibility in the empty consciousness of the catatonic—as though anyone had the slightest idea of what the consciousness of a catatonic looks like!

[875] The following sentence may be taken as the final result of his analyisis of suggestibility: "I regard complete senselessness or complete lack of moderation as the criteria for all psychic effects that can be called suggestions." Unfortunately I can make neither head nor tail of this. In the course of a fifty-page analysis the concept of suggestibility has, to be sure, rambled off into nebulosity, one doesn't quite know how, nor does one know what has become of it. Instead we are offered two peculiar criteria for suggestion, whose beginning and end both lie in the realm of unintelligibles.

[876] There now follows a chapter on one of the thousand hysterical symptoms: ataxia-abasia. The essence of this chapter is its emphasis on the meaning of hysterical paralysis. Another chapter deals with the meaning of hysterical disturbance of sensation. Hellpach treats hysterical pain-apraxia as an illness on its own, but offers no proof of this. Equally, he treats hysterical hyperaesthesias as a physiological and not a psychological problem. Here again conclusive reasons are lacking. Particularly in hysteria, however, "explanatory principles should not be multiplied beyond the necessary."[2] To explain anaesthesia, Hellpach uses the apperceptive extinction of sensation, that aforementioned paradoxical phenomenon which is anything but a simple, certain, clear-cut fact. The proposition that hysterics cease to feel when they ought to feel must be applauded. But this singular fact should not be explained by an even more obscure and ill-founded observation.

[877] Hellpach finds the hysterical intellect characterized by *fantastic apperception* and *tractability*. Fantastic apperception is a psychological state in which "fantasy activity is linked with a tendency towards passivization of apperception." One can dimly guess what Hellpach is

getting at with this turgid pronouncement, but I must own I am incapable of forming any clear conception of it. And I do not think that Hellpach had any clear conception of it either, or he would have been able to communicate it to an attentive reader.

[878] Hellpach defines tractability as follows: “The tractable person is one who meets the demands made upon him willingly or with psychic indifference, or at least without actively fighting down inner resistances.” Suggestibility, which in an earlier chapter vanished beneath a flood of psychological and conceptual verbiage, unexpectedly surfaces here in the innocuous guise of “tractability.”

[879] In the chapter entitled “The Psychological Bar to a Psychology of Hysteria,” we get to the “root phenomenon of hysteria.” The “disproportion between the insignificance of the affective cause and the intensity of the expressive phenomenon” is supposed to be the core of hysterical mental abnormity.

[880] The last section of the book deals with the further elaboration and application of the principles previously laid down, and partly with a discussion of Freud’s teachings in regard to the genesis of hysteria. It is to Hellpach’s credit that he understands Freud and is able to keep in check and counterbalance certain biases and exaggerations of the Freudian school. But as regards the genesis of hysteria he nowhere advances beyond Freud, and in point of clarity he lags far behind.

[881] Now and then Hellpach makes sorties against the “unconscious.” He set out to explain various expressive movements in hysteria without reference to this hypothesis. This attempt deserves to be read in the original (pp. 401ff.). To me it seems neither clear nor convincing. Moreover, expressive movements are, *par excellence*, not unconscious phenomena. It is known that the hypothesis of the psychological unconscious is based on quite other facts, which Hellpach does not touch on. Even so, he makes use of the concept of the unconscious several times, probably because he knows of no better one to put in its place.

[882] His attempts in the concluding chapters to elucidate the sociological and historical aspects of the hysteria problem deserve to be greeted as a general tendency; they show that the author has an unusual, indeed splendid over-all view of his material. Unfortunately he remains stuck at

all points in the most general and uncertain of concepts. The net result of all this effort is disproportionately small. The psychological gain reduces itself to the announcement of a grand design and to a few astute observations and interpretations. For this failure the blame lies not least with the extreme infelicities of Hellpach's style. If the reader has at last managed to grasp a sentence or a question, and then hopes to find its continuation or answer in the next sentence, he is again and again pulled up by explanations of how the author arrived at the first sentence and all that can or could be said about this first sentence. In this way the argument proceeds by fits and starts, and the effect of this in the long run is insufferably fatiguing. The number of wrong turns Hellpach takes is astonishing, but he enumerates still more circumstantially how many others he could have taken. The result is that he often has to explain why he is coming back to his theme again. Because of this, the book suffers from a peculiar opacity which makes orientation extraordinarily difficult.

[883] The author has, furthermore, committed a grave sin of omission in that he cites next to no examples. This omission is especially painful when pathological phenomena are being discussed. Anyone who wants to teach something new must first teach his public how to see, but without examples this is impossible. Maybe Hellpach could still come out with a few good and new things if he deigned to descend into the nether regions of case material and experimental research. If he wishes to address himself to the empiricist at all, he will find this advice assuredly justified.

REVIEWS OF PSYCHIATRIC LITERATURE[1]

1906

[884] L. Bruns: *Die Hysterie im Kindesalter*. 2nd revised edn., Halle, 1906. —The author, known for his researches into the symptomatology and therapy of hysteria, has now published a second edition of his book on hysteria in childhood, a work familiar to most medical men. After a short historical introduction he gives a concise survey of the symptomatology, keeping to the empirical essentials and leaving aside all rarities and curiosities with commendable self-restraint. With the help of clear-cut cases he gives a brief description of the various forms and localizations of the paralyses and spasms, tics and choreic affections; somnambulism, lethargies, and states of possession are treated more cursorily, being less common. The painful symptoms (neuralgias, etc.) and bladder disturbances, and particularly the *psychic* symptoms that are so extraordinarily important in hysteria, come off rather poorly. In his discussion of the aetiology, the author holds, as against Charcot, that too much significance should not be attached to heredity. More important, it seems to him, and I think rightly, are the psychic causes in the individual concerned, particularly imitation of bad examples, the influence of bad upbringing, fright, fear, etc. In many cases the influence of the parents is directly psychogenic.

[885] In view of the admitted frequency of infantile hysteria, diagnosis is of great importance, for many cases are not only retarded by a false diagnosis but are completely wrecked by it. The author takes a firm stand on psychogenesis: the unmistakable psychic element in hysterical symptoms is of the utmost significance in differential diagnosis. Often one has to rely on one’s own impressions; the author quotes the classic words of Möbius:[2] “According to the view I have formed of the nature of hysteria, many symptoms can be hysterical, many others not.” In many cases, therefore, the diagnosis of hysteria is less a science than an art.

Commendably, the author urges the greatest caution against assuming *simulation.*

[886] Treatment is fundamentally *always a psychic one;* water, electricity, etc. work only by suggestion. This excellently written chapter is an invaluable guide for the practitioner, but the details of it cannot be gone into here.

[887] The book is written by a practitioner for practitioners; it is no handicap, therefore, that the theoretical side is represented somewhat aphoristically and takes no account of the latest analytical views of Freud.

[888] E. Bleuler: *Affektivität, Suggestibilität, Paranoia.*[3] Halle, 1906. This work, addressed chiefly to psychologists and psychiatrists, is distinguished, like all Bleuler's publications, by its lucidity; its theme is one that is coming more and more into the forefront of psychological interest: namely, affects and their influence on the psyche. This field of research, like some other domains of psychology, suffers greatly from a confusion of concepts. Bleuler therefore proposes, first of all, a clean division between affects proper and intellectual feelings, a conceptual distinction of the greatest value in scientific discussion. *Affectivity*, comprising all affects and quasi-affective processes, is an inclusive concept which covers all nonintellectual psychic processes such as volition, feeling, suggestibility, attention, etc. It is a psychic factor that exerts as much influence on the psyche as on the body.

[889] In the first and second parts of his book Bleuler applies this conception in the realm of normal psychology. In the third part he discusses the *pathological alterations of affectivity*. Affectivity is of the greatest imaginable importance in psychopathology. Quite apart from the affective psychoses proper (manic-depressive insanity), it plays a significant role in psychoses which one was wont to regard as predominantly intellectual. Bleuler demonstrates this with the help of careful clinical histories of *paranoia originaria.*[4] He found that the content of the paranoid picture developed from a *feeling-toned complex*, that is, from ideas accompanied by intensive affect which therefore have an abnormally strong influence on the psyche. This is the keynote of the book.

[890] It is impossible, in a short review, to do justice to the numerous perspectives which Bleuler's book opens out and to the wealth of empirical material it contains. It is urgently recommended first of all to professionals; but non-psychiatrists also, who are interested in the general problems of psychopathology, will not be able to lay it aside without reaping a rich harvest of psychological insights.

[891] Carl Wernicke:[5] *Grundriss der Psychiatrie in klinischen Vorlesungen*. 2nd revised edn., Leipzig, 1906. — Following Wernicke's sudden death, Liepmann and Knapp have seen to the publication of the second edition of this important book, which has acted as a ferment in modern psychiatry like no other. Wernicke incarnated, so to speak, that school of psychopathology which believed it could base itself exclusively on anatomical data. His book is an impressive exponent of this thinking; besides a huge mass of empirical material we find many brilliant speculations whose starting point is always anatomical. The book is the work of an entirely original mind that tried, on the basis of clinical data combined with brain anatomy, to introduce new viewpoints into psychotherapy, hoping to effect a final synthesis of those two mutually repellent disciplines, brain anatomy and psychology. Wernicke is always the master where psychopathological events come closest to the anatomical, above all, therefore, in the treatment of problems clustering round the question of aphasia. His "Psychophysiological Introduction," where he tries to answer questions concerning the connection between cerebral and psychophysiological data, is, even for the non-psychiatrist, one of the most interesting in recent medical literature.

[892] The section that follows, "Paranoid States," introduces Wernicke's famous sejunction theory,[6] which is the cornerstone of his system. The third and longest section treats of "acute psychoses and defective states." Here, with the help of numerous examples, Wernicke develops his revolutionary clinical approach, which has met with only the limited approbation of fellow professionals and has so far not produced a school. Wernicke's ideas, for all their brilliance, are too narrow: brain anatomy and psychiatric clinics are certainly important for psychopathology, but *psychology* is more important still and this is what is lacking in Wernicke. The danger of dogmatic schematism for anyone who follows

in Wernicke's footsteps, but with less brilliance, is very great. It is devoutly to be hoped, therefore, that this admirable book will produce as few schools as possible.

1907

[893] Albert Moll:[7] *Der Hypnotismus, mit Einschluss der Hauptpunkte der Psychotherapie und des Occultismus*. 4th enlarged edn., Berlin, 1907. — Moll's well-known book has now attained nearly twice the size of the first edition. The first, historical section is very full and covers the whole range of the hypnosis movement. The second is a lucid and, didactically speaking, very good introduction to the various forms and techniques of hypnotism, followed by a discussion of the hypnotist's work and the nature of suggestion. Moll defines it thus: "Suggestion is a process whereby, under inadequate conditions, an effect is obtained by evoking the idea that such an effect will be obtained." The third part, treating of symptomatology, is very thorough and contains some good criticism. It also covers the very latest phenomena in the domain of hypnotism, including Mme. Madeleine and "Clever Hans."[8] It is incomprehensible to me why Moll, in the section on dreams, does not consider Freud's pioneering researches. Freud is accorded only a few meagre quotations. In his discussion on the relations between certain mental disturbances (catatonia especially) and similar hypnotic states, Moll has overlooked the work of Ragnar Vogt,[9] which is of significance in this respect. Altogether, the examination of the connection of pathological mental states with hypnosis and related functional phenomena is neither exhaustive nor productive of tangible results, as is the case, incidently, in all textbooks of hypnotism to date. The case of echolalia described on p. 200 may well be a simple catatonia, and this is true also of a large number of so-called "imitative illnesses" which are generally observed by doctors who have no knowledge of the symptomatology of catatonia. If Moll can blithely speak of great suggestibility during sleep, then the whole concept of suggestibility needs very drastic revision. In the discussion on the subconscious one again misses the highly important researches of Freud. Section VIII, "Medicine," gives a very valuable and useful account of the influence of "authorities" on the question of

hypnosis and its alleged dangers. Discussing hypnotic methods of treatment, Moll also touches on the cathartic method. He bases himself here on the original publications of Breuer and Freud,[10] which Freud meanwhile has long since superseded. His present technique differs somewhat from the way Moll describes it. Recently Löwenfeld[11] has given up his negative attitude towards Freud, at least as regards anxiety neurosis. The remaining chapters give a comprehensive account of various psychotherapeutic methods. The forensic significance of hypnotism is also discussed at some length. The final chapter, "The Occult," is a critical survey of the most important "occult" phenomena.

[894] Apart from Löwenfeld's book,[12] Moll's is the best and fullest introduction to hypnotic psychotherapy. It is warmly recommended to all doctors, nerve specialists in particular.

[895] Albert Knapp: *Die polyneuritischen Psychosen*. Weisbaden, 1906. — The first 85 pages are taken up with detailed clinical histories and their epicrises. The following 50 contain a general description of the relevant symptoms, in clear language which makes a rapid orientation possible. The nomenclature is strongly influenced by Wernicke, which will hardly meet with general approval. The preference given to the term "akinetic motility psychosis" for catatonia etc., is hardly intelligible, especially when one considers that it only describes a condition that can take on a totally different appearance the next moment. The book should be especially welcome to psychiatrists.

[896] M. Reichhardt: *Leitfaden zur psychiatrischen Klinik*. Jena, date not given. — This book is a valuable introduction to the elements of psychiatry. The author discusses them under three main heads:

[897] General symptomatology, with clear and precise definitions.

[898] Exploratory methods, with a detailed description of the numerous methods for testing intelligence and apprehension.

[899] Special psychiatry. Here the author confines himself to essentials. On the controversial subject of dementia praecox, the emphasis falls on dementia simplex, catatonia and paranoia, the latter being treated *in globo*, without reference to the special diagnoses of the Kraepelin school, which in practice are irrelevant anyhow. A good index adds to the book's

handiness. Apart from the clear exposition, one of its main advantages is the noteworthy restriction to what is essential. The legal definitions of insanity are taken exclusively from German law-books. On the question of intelligence tests, no mention is made of the not unimportant method of reading a fable with free reproduction afterwards. The statement that in country areas an institution with 1000–1500 beds is enough for a million inhabitants is certainly not true of Switzerland. Besides private institutions, we have in Canton Zurich about 1300 public beds, not nearly enough to meet the demand. For the rest, the book is warmly recommended not only to students, but especially to all doctors called upon to give a judicial opinion on any kind of mental abnormality.

1908

[900] Franz C. R. Eschle: *Grundzüge der Psychiatrie*. Vienna, 1907. — The author—director of the sanatorium at Sinsheim in Baden—has tried to present the fundamentals of psychiatry in the form of a manual, drawing upon his many years of experience as an alienist. Part I treats of the nature and development of insanity. He distinguishes, as general forms of psychic abnormality, a distinctive, an affective, and an appetitive insufficiency, corresponding roughly to the old psychology of Kant. This chapter is rather heavy going. The arrangement is far from clear and the style is often tortuous, for instance p. 37: "In hypnotic sleep, which represents the most intense and persistent form of the artificial suggestive insufficiency of the psychosomatic mechanism, Rosenbach holds that the psychic organ is unable to build up the differentiating unity which stands in antithetical relation to the other parts of the body (and to the external world) as the 'ego,' although it nevertheless represents this unity," etc. This but one example among many!

[901] In Part II, "Clinical Pictures of Insanity," the author gives a description of the specific diseases with a great deal of interesting case material and original views which one cannot always endorse, as for instance when he asserts with Rosenbach that a widespread use of hypnosis would lead to a general stultification of the public. His classification of the psychoses is a mixture of old and modern points of

view; he groups acute hallucinatory confusion and acute dementia (curable stupidity) with dementia praecox while distinguishing paranoia and paranoid dementia.

[902] Part III is a forensic evaluation of doubtful mental conditions. There is a good index of authors and subjects. The book is essentially eclectic and tries to select the best from the old psychiatry and the new and combine them into a unity with a dash of philosophy thrown in. It should therefore prove stimulating reading for doctors in sanatoria who have not kept abreast of the latest developments in psychiatry.

[903] P. Dubois:[13] *Die Einbildung als Krankheitsursache*. Wiesbaden, 1907. —Dubois presents in generally understandable outline his view of the nature and the treatment of the psychoneuroses. He begins with a clear and illuminating definition of "imagination" and then proceeds to show the pathological effects of imagination with the help of numerous instructive examples. His therapy, likewise derived from this view and clearly expounded, consists essentially in enlightening the patients on the nature of their symptoms and in re-educating their thinking. Let us hope that this distinguished book will contribute to a general breakthrough of the conception of the psychogenic nature of most neuroses! Like all Dubois' other writings, it is urgently recommended to the practising doctor. Even though the Dubois method may not be successful with every neurosis, it is eminently suited to have a prophylactic effect, so that cases where the symptoms are due to imprudent suggestions on the part of the doctor may gradually become less common. In conclusion Dubois hints at a possible extension of his therapy to the psychoses—but in this matter the alienist is not so optimistic.

[904] Georg Lomer: *Liebe und Psychose*. Wiesbaden, 1907.— Lomer's book is more an example of *belles-lettres* than a scientific evaluation of sexuality and its psychological derivates. By far the greater part of it is concerned with normal psychosexual processes which it seeks to present to an intelligent lay public. Readers who would like to penetrate deeper must have recourse to Havelock Ellis and Freud. The pathology of sex is discussed in an appendix, with—in comparison with similar productions —a wholesome reserve in the communication of piquant case histories. One could have wished for a rather deeper grasp of the problems of

psychosexual pathology, where such excellent preparatory work has been done, as witness the researches of Freud.

[905] E. Meyer: *Die Ursachen der Geisteskrankheiten*. Jena, 1907. — Meyer's book comes at the right time and will be welcomed not only by every psychiatrist but by all those who are interested in the causes of mental illnesses in the widest sense. It also remedies the palpable lack of any comprehensive account of the aetiology of the psychoses. The author discusses in great detail the numerous factors that have to be taken into account in their causation. The chapter on poisonings is written with especial care. In discussing the psychic causes, which are at present the subject of violent controversy, the author displays a calm impartiality, allowing the psychic elements more freedom of play than do certain other views which would like to reduce the whole aetiology to non-psychic causes. One small error needs correcting: Freud and the Zurich school see in the psychological disposition only the material determinants of the later symptoms, but not the sole cause of psychosis. The author has made a singularly good selection from the extensive literature dealing with the question of aetiology. An excellent index assists easy reference.

[906] Sigmund Freud: *Zur Psychopathologie des Alltagslebens*. 2nd enlarged edn., Berlin, 1907.[14] — It is a heartening sign that this important book has now gone into a second edition. It is practically the only major work of Freud's that introduces his ideas into the world with little or no effort, so simply and fluently is it written. Thus it is well suited to initiate the layman (and there are few who are *not* laymen in this field) into the problems of Freudian psychology. It is concerned not with the speculations of theoretical psychology but with psychological case material taken from everyday life. It is just the apparently insignificant incidents of everyday life that Freud has made the theme of his researches, showing with the help of numerous examples how the unconscious influences our thoughts and actions at every turn in an unexpected way. Many of his examples have an implausible look, but one should not be put off by that, because all unconscious trains of thought in an individual look anything but plausible on paper. The profound truth of Freud's ideas will carry conviction only when one tests them for oneself. Even for those who are not especially interested in psychological matters

Freud’s book makes stimulating reading; for those who think more deeply, who by inclination or profession are interested in the psychic processes, it is a rich mine of far-sighted ideas which have a significance that can scarcely be estimated at present for the whole range of mental and nervous diseases. In this respect the book is an easy guide to Freud’s latest works on hysteria,[15] which despite the deep truth of their subject-matter, or because of it, have hitherto met only with fanatical opposition and intractable misunderstanding. The book is therefore recommended with all urgency to alienists and to nerve specialists in particular.

1909

[907] L. Löwenfeld:[16] *Homosexualität und Strafgesetz*. Wiesbaden, 1908. — This book is the product of the current struggle that has been touched off in Germany by section 175 of the penal code. This section, as is generally known, concerns unnatural vice between men, and also with animals. The author gives a concise history of the clinical concept of homosexuality. He sums up the present state of opinion as follows: “Though homosexuality is an anomaly that may appear in the physical sphere in association with disease and degeneration, in the majority of cases it is an isolated psychic deviation from the norm, which cannot be regarded as pathological or degenerative and is not likely to reduce the value of the individual as a member of society.” Section 175, which became law only under the pressure of orthodoxy despite opposition by influential authorities, has so far proved to be not only useless and inhuman, but directly harmful as it offers opportunities for professional blackmail with all its tragic and repulsive consequences. The book gives a very good survey of the whole question of homosexuality.

[908] Karl Kleist: *Untersuchungen zur Kenntnis der psychomotorischen Bewegungsstörungen bei Geisteskranken*. Leipzig, 1908 — The book presents the clinical history of a motility psychosis alias catatonia with a detailed epicritical discussion. The author leans heavily on the views of Wernicke, with the result that the book is concerned chiefly with cerebral localizations. The conclusion reached is that psychomotor disturbances in catatonics are conditioned by two factors, innervatory and psychic. The seat of disease is supposed to be the terminal point of the cerebellar-

cortical tracts, i.e., the frontal cerebral cortex. As the patients occasionally have sensations of strain and fatigue in the performance of the tasks assigned them, and as the psychomotor symptoms are due to a disturbance of the motor reactions coordinated with these sensations, the psychic conditioning factor likewise points to the cerebellar-frontal system. This conclusion is logical if one regards the psychic functional complexes as an appendix of their executive organs from the start. The book is recommended to specialists because of its acute differential-diagnostic analysis of apraxia and related motility disturbances.

[909] Oswald Bumke:[17] *Landläufige Irrtümer in der Beurteilung von Geisteskranken*. Wiesbaden, 1908. — This little book contains more than its title indicates. It is a short and clearly written outline of psychiatry, and while it does not give an altogether elementary description of the psychoses it presupposes some knowledge of the main types—knowledge which almost every practitioner possesses today. On this basis the author discusses questions which are wont to present difficulties to doctors with no psychiatric training in their assessment of mental disturbances. Aetiology, diagnosis, prognosis, and therapy are discussed from this standpoint, the author giving valuable advice and hints from his own practical experience. At the end there is a chapter on the forensic view of the insane.

[910] A comprehensive and handy little book, highly recommended.

[911] Christian von Ehrenfels: *Grundbegriffe der Ethik*. Wiesbaden, 1907. — The author—professor of philosophy in Prague—gives a philosophical but easily understandable account of his basic ethical concepts. His argument culminates in the confrontation between social and individual morality, once more a subject of violent controversy. The conclusion reached, though typical of the general tenor of the book, can hardly be called positive: “Normative morality is identical with correct social morality, the sole proviso being that every individual must be free to modify social morality, not in accordance with his own caprice but in a manner he can defend before the tribunal of the eternal and inscrutable.”

[912] Christian von Ehrenfels: *Sexualethik*. Wiesbaden, 1907.— While the author’s *Grundbegriffe der Ethik* is mainly of theoretical interest, this work is of great practical importance. It is the clearest and best account I

know of sexual ethics and its postulates. The author begins with a deeply thought out and lucid presentation of natural and cultural sexual morality. The following chapter, “Contemporary Sexual Morality in the West,” discusses the tremendous conflict between the postulates of natural and cultural sexuality, the socially useful effects of monogamy on the one hand and its shadow-side on the other, prostitution, the double sexual morality of society and its pernicious influence on culture. In his discussion of reform movements the author takes a cautious and reserved stand, as far from Philistine approval of the *status quo* as from certain modern tendencies that would like to pull down all barriers. Although he has no definite programme of reform (which shows he is no dreamer!), he expresses many liberal views which will surely help to solve our greatest social problem, beginning with the individual. His book, which unlike others of the kind is not a parade of garish nudities veiled in scientific garb, deserves the widest acclaim for its unpretentious and reasonable attempt to find *possible* solutions.

[913] Max Dost: *Kurzer Abriss der Psychologie, Psychiatrie und gerichtlichen Psychiatrie*. Leipzig, 1908. — This little book is a new kind of compendium of psychiatry with special reference to intelligence testing. Psychology comes off rather too lightly. The chapters on psychiatry, however, really offer everything one could expect from a short outline. For the psychiatrist the enumeration of various psychic exploratory methods will be particularly welcome. It will be hard to find so handy an account anywhere in the literature.

[914] Alexander Pilcz: *Lehrbuch der speziellen Psychiatrie für Studierende und Aerzte*. 2nd revised edn., Leipzig and Vienna, 1909. — Not every branch of medicine is in such an infantile state of development as psychiatry, where a textbook, which ought to have general validity, is only of local significance. When one considers that dementia praecox is a disease which in Zurich accounts for half the admissions, in Munich is steadily decreasing (as a result of new theories), is not common in Vienna, is rare in Berlin and in Paris hardly occurs at all, the reviewer of a psychiatric textbook must disregard the Babylonian confusion of tongues and concepts and simply accept the standpoint of the textbook in question. Pilcz’s book, now in its 2nd edition, is an admirable work

which fulfils its purpose. It is excellently written, and contains everything essential. The material is clearly arranged, the exposition terse and precise. Highly recommended.

[915] W. von Bechterew: *Psyche und Leben*. 2nd edn., Wiesbaden, 1908. — This book does not treat of psychological problems on the basis of a wide knowledge of the literature, as the title might suggest, but deals with psychophysiological relations in general from the theoretical philosophical side, and then goes on to discuss the relation of energy to the psyche and of the psyche to physiology and biology. The style is aphoristic; the chapters, thirty-one in number, are only loosely connected. The chief value of the book lies in its numerous reports of the views of a great variety of specialist researchers and in its literary references. Readers who want a synthetic or critical clarification of the psychophysiological problems will seek for it in vain. But for anyone who seeks orientation in this interesting field and its complicated, widely dispersed literature this stimulating book is highly recommended.

[916] M. Urstein: *Die Dementia praecox und ihre Stellung zum manisch-depressiven Irresein*. Vienna, 1909. — As the title indicates, this is a clinical examination of dementia praecox diagnosis, a topic that has come once more to the forefront because of the recent swing towards the Kraepelin school. Not everyone will be able to imitate the ease with which manic-depressive insanity is now distinguished from dementia praecox, and Urstein is one of them. He sharply criticizes the work of Wilmann and Dreyfus, who would like to restrict dementia praecox diagnosis in favour of manic-depressive insanity. His book can count on the decided sympathy of all who doubt the thoroughness of Kraepelin’s diagnostics, and who cannot go along with the idea that a catatonic is from now on a manic-depressive. Pages 125 to 372 are padded out with case histories, an unnecessary appendage in view of the specialist readership for which the book is intended.

[917] Albert Reibmayer: *Die Entwicklungsgeschichte des Talentes und Genies*. Munich, 1908. — Only the first volume of the book is available at present, but despite this drawback it is already apparent that it is a broad and comprehensive study. The present volume is essentially a theoretical, constructive survey of the problem, which naturally has

extensive ramifications into biology and history. If the second volume provides the necessary biographies and suchlike material, we shall have in Reibmayer’s book an important work meriting the widest attention.

[918] P. Näcke:[18] *Über Familienmord durch Geisteskranke*. Halle, 1908. — The book is a monograph on family murder. The author presents 161 cases, classified according to their respective peculiarities. He is of the opinion that family murder is now on the increase. He distinguishes between “complete” and “incomplete” family murder. The first is more common in the case of relatively sane individuals; the second more common with the insane. The murderers are usually in the prime of life. The victims of the men are usually their wives, of the women their children. The commonest causes are chronic alcoholism, paranoia, and epilepsy in men; melancholy, paranoia, and dementia praecox in women.

[919] Th. Becker: *Einführung in die Psychiatrie*. 4th revised and enlarged edn., Leipzig, 1908. — This handy little book is a clear and concise introduction to psychiatry. With regard to the classification of the psychoses the author is conservative, allowing a good deal of room for paranoia alongside dementia praecox. The book has much to recommend it as an “introduction” if one disregards the chapter on hysteria, which no longer meets with modern requirements.

[920] A. Cramer: *Gerichtliche Psychiatrie*. 4th revised and enlarged edn., Jena, 1908. — Cramer’s guide to judicial psychiatry, now in its fourth edition, is one of the best of its kind; it is thorough, comprehensive, and, compared with Hoche’s manual,[19] has the great advantage of consistent exposition. As everywhere in psychiatry, the lack of a consistent classification is to be regretted; this is not the fault of the author but of the discipline itself. Were it not for this inconvenience Cramer’s book could be generally recommended; as it is, the beginner can rely on it completely only if he is disposed to trust its particular approach. For the rest, the book will prove useful in the hands of psychiatric experts.

[921] August Forel:[20] *Ethische und rechtliche Konflikte im Sexualleben in- und ausserhalb der Ehe*. Munich, 1909. — The author introduces his book with the following words: “The following pages are for the most part an attack, based on documentary material, on the hypocrisy, the dishonesty and cruelty of our present-day morality and our almost non-

existent rights in matters of sexual life.” From which it is apparent that this work is another contribution to the great social task to which Forel has already rendered such signal service. Essentially it presents a large number of psychosexual conflicts of a moral or judicial nature, knowledge of which is indispensable not only for the nerve specialist, but for every doctor who has to advise his patients in the difficult situations of life.

THE SIGNIFICANCE OF FREUD'S THEORY FOR NEUROLOGY AND PSYCHIATRY[1]

[922] In medical terms, Freud's achievements are on the whole limited to the fields of hysteria and obsessional neurosis. His investigations begin with the psychogenetic explanation of the hysterical symptom, an explanation formulated by Möbius and experimentally tested by Pierre Janet. According to this point of view, every physical symptom of a hysterical nature is causally connected with a corresponding psychological event. This view can be corroborated by a critical analysis of the hysterical symptom, which becomes intelligible only when the psychological factor is taken into account, as exemplified by the many paradoxical phenomena of cutaneous and sensory anesthesias. But the theory of psychogenesis cannot explain the *individual determinants* of the hysterical symptom. Stimulated by Breuer's discovery of a psychological connection, Freud bridged this large gap in our knowledge by his method of psychanalysis, and he demonstrated that a determining psychological factor can be found for every symptom. The determination always proceeds from a *repressed feeling-toned complex of representations*. (Lecturer illustrates this statement with a few case histories taken partly from Freud, partly from his own experience.) The same principle applies to the obsessional neurosis, the individual manifestation of which is determined by very similar mechanisms. (Lecturer adduces a number of examples.) As Freud maintains, sexuality in the widest sense plays a significant role in the genesis of a neurosis, quite understandably so, since sexuality plays an important role in the intimate life of the psyche. Psychanalysis, in addition, has in many cases an unmistakable therapeutic effect, which however does not mean that it is the only way of treating a neurosis. By dint of his theory of psychological determination, Freud has become very important for psychiatry, especially for the elucidation of the symptoms, so far completely unintelligible, of dementia praecox. Analysis of this disease uncovers the same psychological mechanisms that are at work in the

neuroses, and thus makes us understand the individual forms of illusionary ideas, hallucinations, paraesthesias, and bizarre hebephrenic fantasies. A vast area of psychiatry, up until now totally dark, is thus suddenly illuminated. (Lecturer relates two case histories of dementia praecox as examples.)

REVIEW OF STEKEL: “NERVÖSE ANGSTZUSTÄNDE UND IHRE BEHANDLUNG”[1]

[923] The book contains a presentation of states of nervous anxiety, buttressed by an abundance of case material: in Part I, Anxiety Neuroses, in Part II, Anxiety Hysteria. The clinical boundaries for either group are flung far afield, taking in much more than existing clinical methods have accounted for. Anxiety neurosis, especially, is enriched by many new categories of disease, the symptoms of which are taken to be *equivalents of anxiety*. By its very nature anxiety hysteria has fluctuating boundaries and tends to merge with other forms of hysteria. Part III is concerned with the general diagnostics of anxiety states as well as general therapy and, specifically, the technique of psychotherapy. Now, what makes the book especially attractive is the fact that Stekel, a pupil of Freud, very laudably makes the first attempt to enable a larger medical public to gain insight in the psychological structure of the neuroses. In his case histories, Stekel does not confine himself to presenting only the surface (as has hitherto been usual), but, following the most intimate individual reactions of the patient, gives a penetrating picture of the psychogenesis in each case and its further progress during the therapeutic effect of the psychoanalysis. He analyses many cases with great skill and rich experience and in great detail, while others are presented only in psychological outline, which the psychological layman may have difficulty in following. Such outline presentations, unfortunately, cannot be avoided if the book is not to become inordinately long, even though such cases are hard to understand and can easily lead to misconstruction and to the reproach that the author indulges in rash interpretation. On the basis of this method, which specifically considers every individuality on its own terms, Stekel can demonstrate that without exception states of nervous anxiety are determined by psychosexual conflicts of the most intimate nature, thereby once more confirming Freud’s assertion that neurotic anxiety is nothing but a converted sexual desire.

[924] Up to now we suffered from a lack of case material in the light of Freudian analysis. To an extent Stekel’s book fills this gap. It is very readable and therefore must be highly recommended to all practising physicians, not merely to specialists, for open and hidden neuroses are legion and every physician has to cope with them.

EDITORIAL PREFACE TO THE “JAHRBUCH”[1]

[925] In the spring of 1908 a private meeting was held in Salzburg of all those who are interested in the development of the psychology created by Sigmund Freud and in its application to nervous and mental diseases. At this meeting it was recognized that the working out of the problems in question was already beginning to go beyond the bounds of purely medical interest, and the need was expressed for a periodical which would gather together studies in this field that hitherto have been scattered at random. Such was the impetus that gave rise to our *Jahrbuch*. Its task is to be the progressive publication of all scientific papers that are concerned in a positive way with the deeper understanding and solution of our problems. The *Jahrbuch* will thus provide not only an insight into the steady progress of work in this domain with its great future, but also an orientation on the current state and scope of questions of the utmost importance for all the humane sciences.

DR. C. G. JUNG

MARGINAL NOTES ON WITTELS: “DIE SEXUELLE NOT”[1]

[926] This book is written with as much passion as intelligence. It discusses such questions as abortion, syphilis, the family, the child, women, and professions for women. Its motto is: “Human beings must live out their sexuality, otherwise their lives will be warped.” Accordingly, Wittels lifts up his voice for the liberation of sexuality in the widest sense. He speaks a language one seldom hears, the language of unsparing, almost fanatical truthfulness, that falls unpleasantly on the ear because it tears away all shams and unmasks all cultural lies. It is not my business to pass judgment on the author’s morals. Science has only to listen to this voice and tacitly admit that it is not a lone voice crying in the wilderness, that it could be a leader for many who are setting out on this path, that we have here a movement rising from invisible sources and swelling into a mightier current every day. Science has to test and weigh the evidence—and understand it.

[927] The book is dedicated to Freud and much of it is based on Freud’s psychology, which is in essence the scientific rationalization of this contemporary movement. For the social psychologist the movement is and remains an intellectual problem, while for the social moralist it is a challenge. Wittels meets this challenge in his own way, others do so in theirs. We should listen to them all. Nowhere is the warning more in place that on the one hand we should refrain from enthusiastic applause, and on the other not kick against the pricks in blind rage. We have to realize, quite dispassionately, that whatever we fight about in the outside world is also a battle in our inner selves. In the end we have to admit that mankind is not just an accumulation of individuals utterly different from one another, but possesses such a high degree of psychological collectivity that in comparison the individual appears as merely a slight variant. How shall we judge this matter fairly if we cannot admit that it is also our own problem? Anyone who can admit this will first seek the solution in himself. This, in fact, is the way all great solutions begin.

[928] Most people, however, seem to have a secret love of voyeurism; they gaze at the contestants as though they were watching a circus, wanting to decide immediately who is finally right or wrong. But anyone who has learnt to examine the background of his own thoughts and actions, and has acquired a lasting and salutary impression of the way our unconscious biological impulses warp our logic, will soon lose his delight in gladiatorial shows and public disputation, and will perform them in himself and with himself. In that way we preserve a perspective that is particularly needful in an age when Nietzsche arose as a significant portent. Wittels will surely not remain alone; he is only the first of many who will come up with "ethical" conclusions from the mine of Freud's truly biological psychology—conclusions that will shake to the marrow what was previously considered "good." As a French wit once remarked, of all inventors moralists have the hardest lot, since their innovations can only be immoralities. This is absurd and at the same time sad, as it shows how out of date our conception of morality has become. It lacks the very best thing that modern thought has accomplished: a biological and historical consciousness. This lack of adaptation must sooner or later bring about its fall, and nothing can stop this fall. And here I am reminded of the wise words of Anatole France: "And, although the past is there to point out to them ever-changing and shifting rights and duties, they would look upon themselves as dupes were they to foresee that future humanity is to create for itself new rights, duties and gods. Finally, they fear disgracing themselves in the eyes of their contemporaries, in assuming the horrible immorality which future morality stands for. Such are the obstacles to a quest of the future."[2]

[929] The danger of our old-fashioned conception of morality is that it blinkers our eyes to innovations which, however fitting they may be, always carry with them the odium of immorality. But it is just here that our eyes should be clear and far-seeing. The movement I spoke of, the urge to reform sexual morality, is not the invention of a few cranky somnambulists but has all the impact of a force of nature. No arguments or quibbles about the *raison d'être* of morality are any use here; we have to accept what is most intelligent and make the best of it. This means tough and dirty work. Wittels'book gives a foretaste of what is to come,

and it will shock and frighten many people. The long shadow of this fright will naturally fall on Freudian psychology, which will be accused of being a hotbed of iniquity. To anticipate this I would like to say a word in its defence now. Our psychology is a science that can at most be accused of having discovered the dynamite terrorists work with. What the moralist and general practitioner do with it is none of our business, and we have no intention of interfering. Plenty of unqualified persons are sure to push their way in and commit the greatest follies, but that too does not concern us. Our aim is simply and solely scientific knowledge, and we do not have to bother with the uproar it has provoked. If religion and morality are blown to pieces in the process, so much the worse for them for not having more stamina. Knowledge is a force of nature that goes its way irresistibly from inner necessity. There can be no hushing up and no compromises, only unqualified acceptance.

[930] This knowledge is not to be identified with the changing views of the ordinary medical man, for which reason it cannot be judged by moral criteria. This has to be said out loud, because today there are still people claiming to be scientific who extend their moral misgivings even to scientific insights. Like every proper science, psychoanalysis is beyond morality; it rationalizes the unconscious and so fits the previously autonomous and unconscious instinctual forces into the psychic economy. The difference between the position before and afterwards is that the person in question now really *wants* to be what he is and to leave nothing to the blind dispensation of the unconscious. The objection that immediately arises, that the world would then get out of joint, must be answered first and foremost by psychoanalysis; it has the last word, but only in the privacy of the consulting room, because this fear is an individual fear. It is sufficient that the goal of psychoanalysis is a psychic state in which "you ought" and "you must" are replaced by "I will," so that, as Nietzsche says, a man becomes master not only of his vices but also of his virtues. Inasmuch as psychoanalysis is purely rational—and it is so of its very nature—it is neither moral nor antimoral and gives neither prescriptions nor any other "you oughts." Undoubtedly the tremendous need of the masses to be led will force many people to abandon the standpoint of the psychoanalyst and to start "prescribing."

One person will prescribe morality, another licentiousness. Both of them cater to the masses and both follow the currents that drive the masses hither and thither. Science stands above all this and lends the strength of its armour to Christian and anti-Christian alike. It has no confessional axe to grind.

[931] I have never yet read a book on the sexual question that demolishes present-day morality so harshly and unmercifully and yet remains in essentials so true. For this reason Wittels' book deserves to be read, but so do many others that deal with the same question, for the important thing is not the individual book but the problem common to them all.

REVIEW OF WULFFEN: “DER SEXUALVERBRECHER”[1]

[932] Wulffen’s comprehensive account of sexual misdemeanours is not confined merely to criminal case histories but seeks to get at the psychological and social foundations of the offence. Two hundred and fifty pages alone are devoted to sexual biology in general, sexual psychology, characterology, and pathology. In the chapter on sexual psychology the author himself will surely deplore the absence of psychoanalytic viewpoints. The other chapters on criminology, being written by an experienced criminologist, are of great interest and very stimulating to the researcher in this field. The illustrations are uniformly good, some of them of great psychological value.

[933] For a future psychoanalytic investigation of this subject Wulffen’s book should be a most valuable source alongside the compilations of Pitaval.[2]

ABSTRACTS OF THE PSYCHOLOGICAL WORKS OF SWISS AUTHORS

(*to the end of 1909*)[1]

[934] This compilation contains among other things all works of the Zurich school that are either directly concerned with psychoanalysis or touch upon it in essentials. Works with a clinical or psychological content not concerned with psychoanalysis have been omitted. Abraham's works, including those written in Zurich, are abstracted in *Jahrbuch* 1909. A few works by German authors that come close to the findings in *Diagnostische Assoziationsstudien* are noted in passing. A consideration of the critical and oppositional literature is unfortunately impossible as long as the scientific soundness of our principles of research is called in question.

[935] Bezzola (formerly Schloss Hard, Ermatingen): "Zur Analyse psychotraumatischer Symptome," *Journ. f. Psychol, u. Neurol.*, VIII (1907). — The author still bases himself entirely on the trauma theory. His procedure corresponds in detail to the Breuer-Freud method, which was called "cathartic." The author has no real grasp of later methods. He recommends a modification which he calls *psychosynthesis*. "Every psychically effective experience reaches consciousness in the form of dissociated excitations of the senses. In order to become concepts, these excitations have to be associated among themselves and also with consciousness. But in consequence of the narrow range of consciousness, this process cannot be fully completed, certain components remain in the unconscious or become conscious by false association. Psychosynthesis consists in reinforcing these isolated conscious components by empathy until the components subconsciously associated with them are reactivated, whereupon the development of the whole process reaches consciousness and the dissolution of the psychotraumatic symptoms ensues." This theory is supported by a series of cases. Naturally they are presented with total blindness for the actual psychosexual background.

The epilogue contains an attack on Freud’s sexual theory in the usual nervous tone and with arguments to match.

Binswanger, see Jung: *Diagnost. Assoz. stud.,* XI.

[936] Bleuler (Zurich): “Freudsche Mechanismen in der Symptomatologie von Psychosen,” *Psychiatr.-neurol. Wochenschrift*, 1906.— Analyses of symptoms and associations in various psychotic states.

[937] Bleuler and Jung: “Komplexe und Krankheitsursache bei Dementia praecox,” *Zentralbl. f. Nervenheilkunde u. Psychiatrie*, XXXI (1908), 220ff. —The authors seek to clarify their aetiological standpoint in the light of Meyer’s critique of Jung’s theory of dementia praecox. They first demonstrate that the new conception is not aetiological but symptomatological. Questions of aetiology are complicated and take second place. Bleuler makes a rigorous distinction between the physical process of disease and the psychological determination of the symptoms, and in view of the importance of the former he attaches no aetiological significance to the latter. As against this, Jung leaves the question of the ideogenic aetiology open, since in physical processes of disease the physical correlate of affect can play an aetiologically significant role.

[938] Bleuler: *Affektivität, Suggestibilität, Paranoia*. Halle, 1906.— In this book Bleuler makes a broadminded attempt to provide a general psychological description and definition of affective processes, and to correlate them with an outline of Freudian psychology. The conception of attention and suggestibility as special instances or partial manifestations of affectivity is a pleasing simplification of the Babylonian confusion of tongues and concepts prevailing in psychology and psychiatry today. Even though the last word has not been spoken, Bleuler offers us a simple interpretation, based on experience, of complicated psychic processes. Psychiatry is in urgent need of this since the psychiatrist is *forced* to think and operate with complicated psychic entities. We could easily wait for a hundred years until we got anything of this kind from experimental psychology. With affectivity as a basis, Bleuler devotes an uncommonly important chapter to the inception of paranoid ideas, demonstrating in four cases that a feeling-toned complex lies at the root of the delusion.

[939] The reviewer must rest content with this general sketch of the book's scope and tendency. Its wealth of detail does not lend itself to brief summation. We can say that Bleuler's book is the best general description to date of the psychology of affect. It is warmly recommended to everyone, especially the beginner.

[940] _____. "Sexuelle Abnormitäten der Kinder," *Jahrbuch der schweiz. Gesellschaft f. Schulgesundheitspflege*, IX (1908), 623ff. — A lucid description of sexual perversions in children. Frequent reference is made to Freud's psychology. The author favours sexual enlightenment, not in the form of mass sex education at school, but at home, the right moment being tactfully chosen by the parents.

_____. See Jung: *Diagnost. Assoz. stud.*, V.

[941] Bolte (Bremen): "Assoziationsversuche als diagnostisches Hilfsmittel," *Allgemeine Zeitschrift f. Psychiatrie*, LXIV (1907).— The author demonstrates the use of the association experiment for diagnostic purposes. He concurs in essentials with the basic findings of the *Diagnostische Assoziationsstudien*. Some interesting examples bring the ideas in this book vividly to life.

[942] Chalewsky (Zurich): "Heilung eines hysterischen Bellens durch Psychoanalyse," *Zentralbl. f. Nervenheilkunde u. Psychiatrie*, XX (1909). [Abstract, by Maeder, omitted.]

[943] Claparède (Geneva): "Quelques mots sur la définition de l'hysterie," *Archives de psychologie*, VII (1908), 1969ff. —The author criticizes with great skill the recent conception of hysteria inaugurated by Babinski. In the concluding chapter he develops his own views into a conception which itself consists of a series of question marks. He acknowledges the importance of Freudian repression and endows it with biological significance. Psychoanalytic resistance, of which he has gained first-hand experience, is for him a defence reaction. He takes the same view of globus [hystericus = lump in the throat], vomiting, spasms in the oesophagus, lying, simulation, etc. He sees bodily symptoms as a revivification of ancestral reactions that were once useful. Thus the hysterogenic mechanism is conceived as a "tendance à la réversion," an atavistic mode of reaction. Its infantile character and the "disposition

ludique” (play tendency) seem to him to support this theory. His arguments lack the necessary empirical basis which of course can only be acquired through psychoanalysis.

[944] Eberschweiler (Zurich): “Untersuchungen über die sprachliche Komponente der Assoziation,” *Allgemeine Zeitschrift für Psychiatrie,* 1908. — A painstaking and careful investigation prompted by the reviewer. One finding is of particular interest for complex psychology: it has been shown that in the association experiment certain vowel sequences occur, i.e., successive reactions have the same vowel sound. Now if these “perseverations” are correlated with complex-indicators, we find that, given an average percentage of 0.36 complex-indicators per reaction, 0.65 fall on a word in the vowel sequence. If we take the two associations preceding the vowel sequences without clang affinity, we reach the following result:

a) Association without vowel sequence: 0.10 complex-indicators.

b) Association without vowel sequence: 0.58 complex-indicators.

1. Beginning of vowel sequence (association with vowel sound perseverating in the ensuing series): 0.91 complex-indicators.

2nd term in the vowel sequence: 0.68.

3rd term in the vowel sequence: 0.10.

4th term in the vowel sequence: 0.05.

[945] It is evident that after complex-disturbances there is a distinct tendency to clang perseverations, and this is an important finding as regards the mechanism of punning and rhyming.

[946] Flournoy (Geneva): *Das Indes à la Planète Mars. Étude sur un cas de somnambulisme avec glossolalie*. 3rd edn., Paris, 1900.— “Nouvelles observations sur un cas de somnambulisme avec glossolalie,” *Archives de psychologie*, I (1901). — Flournoy’s comprehensive and extremely important work on a case of hysterical somnambulism contributes valuable material on fantasy systems and merits the attention not only of psychoanalysts but also of the general public. In presenting his case Flournoy comes very close to certain of Freud’s views, though no use could be made of his more recent discoveries.

[947] Frank Zurich: ‘“Zur Psychoanalyse” (Festschrift for Forel), *Journ. f. Psychol, u. Neurol*. XIII (1908). — After a short historical introduction based on the studies by Breuer and Freud, the author expresses his regret that Freud has abandoned the original method without giving his reasons for so doing. Attentive reading of Freud’s subsequent writings discloses soon enough why he preferred the perfected technique to the originally imperfect one. The author restricts himself to the use of the original cathartic method in conjunction with hypnosis, and his case material proves that he is working with a valuable, practically useful method which yields rewarding results. The inevitable attack on Freud’s theory of sexuality is consequently set forth in more temperate tones. The author poses the question: “Why should just the sexual affects among the many others with which the psyche is endowed give rise to disturbances, or is the sexual affect supposed to be the root of all others?” (The role of sexuality in the neuroses was not invented *a priori*, but was discovered empirically through the use of psychoanalysis, and this is something quite different from the cathartic method.) The author does not use psychoanalysis because “a practising physician should not be obliged, in each case, to carry the psychoanalysis through to its very end for theoretical reasons only.” This obligation exists nowhere, but for *practical* reasons one has to go further than one did in 1895; had the method of that time accomplished everything, there would have been no need for going further. The author gained the impression that Freud mastered hypnosis and suggestion very well in theory, but by no means perfectly in actual practice. “I can understand his constant change of method only on the supposition that, because of his *insufficiently thorough hypnotic treatments and their unsatisfactory results*, he as a theoretician, was constantly trying to find new methods.” Reviewer’s italics. A little earlier in his paper, the author says that “Freud has relinquished these methods *in spite of his successes.*” In connection with this contradiction it should be noted that Frank *utterly ignores* Freud’s later works, as well as the writings of other authors and the Zurich Clinic, otherwise he could not possibly assert—in 1908!—that the cathartic method and its results remained “unnoticed” and only “isolated verifications” were attempted.

[948] (The reviewer cannot refrain from pointing out how simple it is to obtain information on these seemingly difficult problems. If, for instance, an author is faced with the problem why Freud may have given up hypnosis, he need only compose a letter to Professor Freud and inquire about it. On this point the reviewer is insistent because it is the basic sickness of German psychiatry that one is never eager to *understand*, but only to *misunderstand*. In these matters a *personal discussion* is needed in order to eliminate all unnecessary difficulties and misunderstandings. If this principle, which is fully accepted in America, were acknowledged on our continent, we would not see so many otherwise deserving authors making fools of themselves by their criticism, which is frequently couched in a language that renders any reply impossible.)

Fürst, see Jung: *Diagnost. Assoz. stud.*, X.

[949] Hermann (Galkhausen): “Gefühlsbetonte Komplexe im Seelenleben des Kindes, im Alltagsleben und im Wahnsinn,” *Zeitschrift für Kinderforschung*, XIII, 129–43. — Clearly written introduction to the theory of complexes and its application to various normal and pathological psychic states.

[950] Isserlin (Munich): “Die diagnostische Bedeutung der Assoziationversuche,” *Münchner medizinische Wochenschrift*, no. 27 (1907). — In this critical account of the association studies in Zurich, the author acknowledges the existence of several important findings. But where Freudian psychology begins, his approval ends.

[951] Jung (Zurich): *Zur Psychologie und Pathologie sogenannter okkulter Phänomene*.[2] Leipzig 1902. — Besides clinical and psychological discussions on the nature of hysterical somnambulism, this work contains detailed observations on a case of spiritualistic mediumship. The splitting of the personality derives from its infantile tendencies and the fantasy systems are found to be rooted in sexual wish-deliria. Examples of neurotic automatisms include a case of cryptomnesia which the author discovered in Nietzsche’s *Zarathustra*.

[952] _____. “Ein Fall von hysterischem Stupor bei einer Untersuchungsgefangenen,”[3] *Journ. f. Psychol, u. Neurol.*, I (1902).— Description of the patient’s pathological intention, wish to be ill,

Freudian repression of anything unpleasant, and wish-fulfilling delusions in a case of the Ganser-Raecke twilight state.

[953] _____. “Die psychopathologische Bedeutung des Assoziationsexperimentes,”[4] *Archiv für Kriminalanthropologie*, XX (1906), 145ff. — General introduction to the association experiment and the theory of complexes.

[954] _____. “Experimentelle Beobachtungen über das Erinnerungsvermögen,”[5] *Zentralbl. f. Nervenheilkunde u. Psychiatrie*, XXVIII (1905), 653ff. — The author describes the reproduction procedure he himself inaugurated. If, on completion of an association experiment, the subject is asked whether he can remember his previous reaction to each of the stimulus words, it is found that the forgetting usually occurs at or immediately after complex-disturbances. Hence it is a “Freudian forgetting.” The procedure is of practical value in pin-pointing complex-indicators.

[955] _____. “Die Hysterielehre Freuds. Eine Erwiderung auf die Aschaffenburgsche Kritik,”[6] (*Münchner medizinische Wochenschrift*, LIII:47 (1906). — As the title indicates, this is a piece of polemic the aim of which is to induce our opponent to get better acquainted with the psychoanalytic method before judging it. Today this paper is merely of historical value, marking, we might say, the starting-point of the now flourishing Freudian movement.

[956] _____. “Die Freudsche Hysterietheorie,”[7] *Monatsschrift f. Psychiatrie u. Neurologie*, XXIII:4 (1908), 310ff. — A report written at the request of the president of the International Congress for Psychiatry in Amsterdam, 1907. The author confines his remarks to the most elementary principles in accordance with his knowledge at that time, which since then has been considerably enlarged with increasing experience. Historically, Freud’s theory may he regarded as a transformation of the cathartic method into psychoanalysis. The psychoanalytic conception of hysteria is illustrated with the help of a case which may serve as a paradigm. Summary (abbreviated): Certain precocious sexual activities of a more or less perverse nature grow up on a constitutional basis. At puberty, the fantasies tend in a direction constellated by the infantile sexual activity. The fantasies lead to the

formation of complexes of ideas that are incompatible with the other contents of consciousness and are therefore repressed. This repression takes with it the transference of libido to a love-object, thus precipitating a great emotional conflict which then provides occasion for the outbreak of actual illness.

[957] _____. “Associations d’idées familiales”[8] (avec 5 graphiques), *Archives de psychologie*, VII (1907). — With the help of Fürst’s material (see *Diagnostische Assoziationsstudien*, X) the author evaluates the average difference between various types of association. The results are given in percentages, with graphs.

[958] _____. “L’analyse des rêves,”[9] *Année psychologique*, published by Alfred Binet, V (1909), 160ff. — Outline of the elements of Freud’s interpretation of dreams, based on examples from the author’s own experience.

[959] _____. *Über die Psychologie der Dementia praecox.*[10] Halle, 1907. — The book consists of five chapters:

[. Critical survey of theoretical views on the psychology of dementia praecox, as found in the literature up to 1909. In general, a central disturbance is assumed, given different names by different authors, some of whom also mention “fixation” and the “splitting-off of sequences of ideas.” Freud was the first to demonstrate the psychogenic mechanism of paranoid dementia.

[I. The feeling-toned complex and its general effects on the psyche. A distinction is made between the acute and the chronic effects of the complex, i.e., between the immediate and long-lasting assimilation of its contents.

[II. The influence of the feeling-toned complex on the valency of associations. This question is discussed in some detail, the main accent falling on the biological problem of working through the complex and of psychological adaptation to the environment.

IV. Dementia praecox and hysteria: a parallel. A comprehensive description of the similarities and differences of both diseases. Summary: Hysteria contains as its innermost core a complex that can never be overcome completely, though the possibility of overcoming it is present *in potentia*. Dementia contains a complex that has become permanently fixed and can never be overcome.

V. Analysis of a case of paranoid dementia as a paradigm. An absolutely typical case of an elderly patient, presumed to be imbecilic, who produced masses of neologisms that could be satisfactorily explained under analysis and confirm the content of the preceding chapters.

[960] The book has been translated into English by Peterson and Brill, with an introduction by the translators. Title: C. G. Jung: *The Psychology of Dementia Praecox*. Nervous and Mental Diseases Monograph Series No. 3. Authorized translation with an introduction by Frederick Peterson, M.D., and A. A. Brill, Ph.B., M.D. New York, 1909.

[961] _____. *Diagnostische Assoziationsstudien*. Beiträge zur experimentellen Psychopathologie. Edited by C. G. Jung. Vol. I. [Leipzig,] 1906.[11] — This volume contains a selection of works from the Zurich Clinic on association and the association experiment which were previously published separately in the *Journal für Psychologie und Neurologie*. Quite apart from their psychological viewpoint, these works are of practical and medical interest because it was from these researches that the diagnostic association experiment was developed, an experiment which furnishes us with a quick and certain clue to the most important of the complexes. The diagnostic use of the experiment is of primary importance; of secondary importance is its use as a clinical aid to differential diagnosis in very many cases where the diagnosis is still uncertain. [Contents as follows.]

[962] Preface: by Professor Bleuler: "Über die Bedeutung von Assoziationsversuchen," pp. 1–6.—Verbal association is one of the few psychological products that can be evaluated experimentally. Much may be expected from these experiments because the whole psychic past and present, with all their experiences and aspirations, are reflected in the

associative activity. It is an “index of all psychic processes, and we need only decipher it in order to know the whole man.”

[963] I. C. G. Jung and Franz Riklin (Zurich): “Experimentelle Untersuchungen über Assoziationen Gesunder,”[12] pp. 7–145.— The aim of this paper was to collect and present a large amount of associations of normal subjects. In order to evaluate the material statistically, a system of classification was needed that would represent an extension and improvement of the Kraepelin-Aschaffenburg system. The system adopted by the two authors follows logical linguistic principles and allows a statistical evaluation which, though imperfect, is nevertheless sufficient for present purposes. The first question to be discussed was whether and if so what types of reaction occur in the normal state. It was found that, on average, educated subjects exhibit a shallower type of reaction than do the uneducated; further, that the subjects fall into two main types, which shade off into each other: an objective and an egocentric type. The first reacts with few signs of emotion, the second with many. The second type is of particular interest from the practical standpoint and falls into two further subdivisions: the so-called constellation or *complex-constellation type* and the *predicate type*. The first tries to suppress emotions, the second to display them.

[964] Fatigue, somnolence, alcoholic intoxication, and mania produce a shallow type of reaction. The shallowness is due primarily to disturbance of attention in these states. This was proved by conducting a special experiment designed to distract the subject’s attention and then continuing the association test under these conditions. The experiments yielded positive results.

[965] II. K. Wehrlin (Zurich): “Über die Assoziationen von Imbezillen und Idioten,” pp. 146–174. — The author reports the results of his association experiments with 13 imbeciles. The associations of the most feeble-minded exhibit a distinct type known as the *definition type*. Characteristic reactions:

Winter: consists of snow.
Singing: consists of notes and song-books.

Father: member beside the mother.
Cherry: a garden thing.

[966] Imbeciles thus display an extraordinarily intense attitude to the intellectual meaning of the stimulus word. It is characteristic that this type is found precisely among the feeble-minded.

[967] III. C. G. Jung: “Analyse der Assoziationen eines Epileptikers.”[13] pp. 175–92. — The associations of this epileptic clearly belong to the definition type, having an awkward and cumbersome character that confirms and supplements the subject’s own reaction:

Fruit: that is a fruit, a fruity fruit.
Strong: am powerful, that’s strong.
Jolly: I’m jolly. I’m merry.

[968] There are also an extraordinary number of feeling-toned, egocentric associations that are expressed undisguised. Certain indications support the conjecture that the epileptic feeling-tone has a markedly perseverating character.

[969] V. C. G. Jung: “Über das Verhalten der Reaktionszeit beim Assoziationsexperimente.”[14] pp. 193–228. — The hitherto unknown reasons for the abnormal prolongation of certain reaction-times are here investigated, with the following results: Educated subjects react, on average, quicker than the uneducated. Reaction-time of female subjects is. on average, considerably longer than that of male subjects. The grammatical quality of the stimulus word has a definite influence on reaction-time, and so has the logical linguistic quality of the association. *Reaction-times exceeding the probable mean are for the most part caused by the interference of an unconscious repressed complex*. Hence they are an important aid in the discovery of repressed complexes. This is documented with numerous examples of analyses of associations that have been constellated in this way.

[970] V. E. Bleuler: "Bewusstsein und Assoziation." pp. 229–57.—Drawing upon literary as well as case material, this paper sets out to prove that "so far as has been observed, no sharp distinction can be made between conscious and unconscious," and that the same functional structures and mechanisms that we find in our consciousness can be shown to exist outside it and to influence the psyche just as much as the analogous conscious processes. "In this sense there are unconscious sensations, perceptions, conclusions, feelings, fears and hopes, which differ from their conscious counterparts only because the quality of consciousness is absent." B. cites in particular the cases of multiple personality and remarks that we should not speak merely of *an* unconscious, but that an almost infinite number of different unconscious groupings is possible. The grouping of memory elements into different personalities is due without exception to the overriding influence of affects.

[971] B. regards the quality of consciousness as something subsidiary, since psychic processes need to become conscious only under certain conditions, that is to say when they enter into association with "those ideas, sensations, strivings which at a given moment constitute our personality."
